Volume LXXI

January 5 to June 29, 1918

147402

11/11/18

McGRAW-HILL COMPANY, Inc.
Tenth Avenue and Thirty-sixth Street
NEW YORK CITY

INDEX TO VOLUME LXXI

January—June 1918

GENERAL INDEX

Entries from the Digest of Current Electrical Literature are indicated by D (Digest)

PAGES BY WEEKS

Jan. 5.....	1 to 80
Jan. 12.....	81 to 132
Jan. 19.....	133 to 184
Jan. 26.....	185 to 236
Feb. 2.....	237 to 288
Feb. 9.....	289 to 340
Feb. 16.....	341 to 392
Feb. 23.....	393 to 444
Mar. 2.....	445 to 496
Mar. 9.....	497 to 548
Mar. 16.....	549 to 600
Mar. 23.....	601 to 652
Mar. 30.....	653 to 704
Apr. 6.....	705 to 756
Apr. 13.....	757 to 808
Apr. 20.....	809 to 860
Apr. 27.....	861 to 912
May 4.....	913 to 964
May 11.....	965 to 1016
May 18.....	1017 to 1068
May 25.....	1069 to 1120
June 1.....	1121 to 1172
June 8.....	1173 to 1244
June 15.....	1245 to 1300
June 22.....	1301 to 1352
June 29.....	1353 to 1404

A

- Accident prevention:
 - Good lighting lessens accidents, 1194.
 - Hints for line foremen in case of, 52.
 - Preventing installation of wrong-sized fuses, *517.
 - Safety bulletin box, *362.
 - Utilities, co-operative insurance reduces accidents. By Chas. E. Morrison, *1082. Comment, 1069.
- Accounting Section report. N. E. L. A., 1266.
- Adirondack power consolidation plan, 62.
- Advertising. (See Central station business and Displays.)
- Agriculture:
 - Electric farm appliance exhibit, 201.
- Air compressor and grinder outfit. U. S. Air Compressor Co., 595, *802.
- Air compressor, two-cylinder, motor-driven. Midvale Machine Works, *1166.
- Air pressure outfit, automatic. M. L. Bastian Auto Engineering Works, *387.
- Air station, motor-driven. Electric Appliance Co., 1115.
- Air washers for turbo-generators, importance of. By L. H. Parker and J. J. Preble, *564. comment, 707.
- Aircraft production. John D. Ryan appointed director, *1000.
- Alloys:
 - Acid proof (D.), 1328.
 - High-resistance alloys, composition of. By M. A. Hunter (D.), 628.
 - Thermo-electromotive force of. By M. A. Hunter and J. W. Bacon (D.), 1329.
- Alternating-current:
 - Precise measurement of. By C. O. Gibbon, *979; comment, 967.
- Alternators. (See under Generators.)
- Aluminum:
 - Conductivity of. By Guido Grassi (D), 56.

- Aluminum. (Continued)
 - In the electrical industry. By Jean Escard (D), 107.
 - Processes for the manufacture of (D), 835.
 - Production in Germany (D.), 1381.
- Aluminum bronze, (D), 575; hardening of (D), 264.
- American Association for the Advancement of Science, annual meeting, 61.
- American Electrochemical Society, inspection tour through South, 942, *995.
- American Gear Manufacturers' Association, annual meeting, 949.
- American Institute of Electrical Engineers:
 - Address of President Rice, 1374.
 - Annual convention, 579, 1281, *1367, 1374.
 - Chicago Section meeting, 269.
 - Committee reports, 1375.
 - Convention papers and discussions, *411.
 - Edison medal to Col. J. J. Cartv, *1097; comment, 1069.
 - Emblem corona discharge, *978.
 - Joint meeting with Association of Iron and Steel Electrical Engineers, 580.
 - Lynn (Mass.) Section, address by E. W. Rice, Jr., 322.
 - Members in uniformed war service, 785.
 - Midwinter convention, 322, *411, 424.
 - Nominations, 322, *629.
 - President Rice's address, 424.
 - Section meetings, 690.
 - Service poster, *946.
- Single-phase induction motors discussed, 844.
- War's effect on cost and quality of service discussed, 165.
- American Metric Association, annual meeting, 64.
- American Society for Testing Materials, annual meeting1327
- American Society of Mechanical Engineers:
 - Boiler code, 201.
 - Convention, 1282.
 - Spring meeting, 742, 1156.
- American Telephone & Telegraph Company, annual report, 584.
- American Washing Machine Manufacturers' Association, war service work, 268; annual meeting, 377.
- Antennas. (See Radio.)
- Arc:
 - Circuit-breaker arc, effect of magnetic field on. By A. M. Holcomb, *1377.
 - “Singing” arc, theory of the oscillations. By Lieut.-Col. J. B. Pomey (D), 1095.
 - Suppression of arcs due to accidental ground. By M. H. Collbohm (D), 158.
- Arc lamps:
 - Testing under pressure (D), 262.
 - With two pairs of carbons for networks with polyphase currents of low frequency (D.), 314.
- Arkansas Association of Public Utility Operators, 1054, 1155.
- Armature:
 - Closed windings, rational theory of. By A. Illović (D), 209.
 - Coil winding by blind workers, *114.
 - Lead shaping tool. By Frank Huskinson, *1377.
 - Magnetic pull on. By E. Rosenberg (D), 782.
 - Winding, continuous-current, elementary principles of. By F. M. Denton (D.), 939, (D.) 1094, (D.) 1219, (D.) 1278.
- Army cantonments. (See Cantonments.)
- Army engineers, how to join, 668.
- Army kitchen, electric, *662.
- Associated Manufacturers of Electrical Supplies:
 - Annual meeting, 525, 581, 632, *680.
 - Board of governors meeting, 318.
 - Heating and current-consuming devices section, 1049, 1154.
 - International trade committee meeting, 475.
 - Section meetings, 1154.
 - Signaling Apparatus Section meeting, 790.
 - Tariff committee progress, 265.
 - War service committee's work, *46, *109, 164.
 - Wire and Cable Section, war service, *892.
- Association of Edison Illuminating Companies:
 - President Junkersfeld resigns, 738.

*Indicates illustrated articles.

- Association of Iron and Steel Electrical Engineers:
 - Committees' chairmen, 325.
 - Joint meeting with A. I. E. E., 580.
- Audion characteristic curves, effects produced upon by various kinds of signals. By A. D. Cole (D), 835.
- Automobile:
 - Air station, motor-driven. Electric Appliance Co., 1115.
 - Gasoline sprayer, portable. Midvale Machine Works, *1238.
 - Generators for charging storage batteries. Carleton Co., 1399.
 - Headlamps, report on (D), 939.
 - Light controller. American Sales Corp., 282.
 - Lightning switch. Industrial Controller Co., *75.
 - Primer, electrically heated. Master Primer Co., *75.
 - Testing device. Jefferson Electric Mfg. Co., *74.
 - Valve grinder, Stenman Electric Valve Co., Inc., 1399.
- Automobile electric kitchen. By Anson S. Rice (D) 941.

B

- Balancers. (See Motor Generators.)
- Batteries:
 - Carbon, catalytic action of (D.), 1329.
 - Charging equipment of Southern Pacific (D), 940.
 - Charging, methods and plant for. By F. Aytton (D), 940.
 - Charging outfit. Hobart Brothers Company, *698; Emerson Electric Mfg. Co., *1010; Stahl Rectifier Co., *1167.
 - Dry cells and wet batteries. By Wm. J. Heedman (D.), 678.
 - Storage-battery capacities, calculation of. By C. W. Hazelett (D.), 990.
 - Storage battery earnings, 897.
 - Storage-battery industry. By L. Jumeau (D), 1096.
 - Bell chime, motor-operated at Boston store, *1384.
- Blind workers, winding armature coils, *114.
- Blowers:
 - Disk fan. Bicalky Fan Co., *594.
 - Fan engine mounting, 52.
 - Louvers for ventilating fans. Batterman & Truitt Co., *230.
 - Motors for. By C. E. Clewell, *196; comment, 610.
 - Propeller fan pulley-driven. Batterman & Truitt Co., 179.
- Boiler house practice, improvement in....1038
- Boiler room:
 - Ash-handling system, points on purchasing. By Herbert E. Birch (D), 421.
 - Boiler and furnace equipment, New Bedford (Mass.) company 1, *398; comment, 394; II, *771; comment, 758.
 - Boiler room data, Joliet Station, 194.
 - Boiler maintenance, reducing costs of. By S. B. Applebaum, *349; comment, 341.
 - Columbus (Ohio) plant equipment, *450; comment, 447.
 - Economies, 636.
 - Economy increased by use of fuel oil, *711.
 - Feed-water regulators, automatic, as an investment. By M. A. Saller (D), 783.
 - Firing high-grade coal during peak load to increase boiler capacity, 935.
 - Furnace walls, building and care of. By L. Conge (D), 471.
 - Handling coal and ashes with a single hoist, *518.
 - Heat insulation to save coal. By Austen Bolam, *554.
 - Indicator, CO₂, Dwight Mfg. Co., *542.
 - Measuring equipment, 933.
 - Monorail hoist for handling ashes. Link-Belt Co., *283.
 - Operating furnace while mending stoker, *620.

Boilers:

- A. S. M. E. code, 201; revision (D.), 784.
- Asbestos insulation, advantages of, 1275.
- Burning dust-bearing coal efficiently. By L. A. Stenger, *1080; comment, 1302.
- Coal waste preventable. By G. W. Partridge, *577.
- Corrosion, prevention of. By Ch. Chorower (D.), 1046.
- Emergency temporary repair, 726.
- Evaporation, new method of increasing. By Carl Hering (D.), 107.
- Feed water:
 - Data for analyzing. By T. W. Reynolds, 257.
 - For steam boilers. By J. A. Montpelier (D.), 1278.
 - Joliet plant system, *193; comment, 185.
 - Method of weighing. By T. W. Reynolds, *310.
 - Purification of. By W. T. Read (D.), 1279.
 - Samples. By T. W. Reynolds, 99.
 - Softening systems. By S. B. Applebaum, 349; comment, 341.
- Fuel bed of uniform thickness essential for economy, 518.
- Furnace arch:
 - Effect on smoke abatement (D.), 159.
 - Hight-set. Green Engineering Co., *1010.
- Furnace explosion, prevention of. By Gilbert Rutherford, 100, 309.
- Furnaces, design of and combustion of coal. By Henry Kreisiger, C. E. Augustine and F. K. Ovitiz (D.), 626.
- Furnaces, regulating combustion in. By L. Conger (D.), 1380.
- Gas firing of. By T. M. Hunter (D.), 105.
- Gas for fuel, efficient use of, 1142.
- Grates, emergency temporary repair for, 568.
- Operating broken chain grate in emergency, 466.
- Powdered coal, results from. By A. E. Macinnis, *1032; comment, 1018.
- Radiant heat and fire-box design. By James T. Anthony (D.), 1146.
- Settings, asbestos covering for, 1309.
- Smoke breaching, expansion joint for. By T. W. Reynolds, *570.
- Soot blowers, mechanical, effect 15 per cent coal reduction, 154.
- Soot formation, loss from and prevention, *1203.
- Stokers:
 - Mechanically operated. By M. Lamotte (D.), 55.
 - Selection of. By Joseph Worker (D.), 887.
 - Underfeed type, efficient combustion of bituminous coal with. By Russell C. Hine (D.), 1328.
- Tubes, rusting and prevention. By Bruno Zschokke (D.), 835.

Bonus system for power-plant employees. By Warren B. Lewis (D.), 941.

Book reviews:

- Business Law for Engineers. By C. Frank Allen, 151.
 - Electric Vehicle Handbook. By Frank W. Smith and H. C. Cushing, Jr., 50.
 - Empirical Formulas. By Theodore R. Running (D.), 211.
 - Employment Department and Employee Relations. By F. C. Henderschott, 1273.
 - Engineering Mathematics, *1087.
 - Everyman's Chemistry. By Ellwood Hendrick, 316.
 - Finding and Stopping Waste in Modern Boiler Rooms. By the engineers of the Harrison Safety Boiler Works, 1087.
 - How to Make High-Pressure Transformers. By Prof. F. E. Austin, 151.
 - Industrial Research in the United States. By A. P. M. Fleming (D.), 991.
 - Lighting Art. By M. Luckiesh, 872.
 - Mystery of Matter and Energy. By Dr. Albert C. Crehore, 50.
 - Petroleum and Natural-Gas Register, 991.
 - Practical Electrical Illumination. By Terrell Croft, 316.
 - Radio Communication, Theory and Methods, with an Appendix on Transmission Over Wires. By John Mills, 991.
 - Theory of Submarine Telegraph and Telephone Cable. By H. W. Malcolm, 50.
- Booster station in plant of power customer, 273.
- Boston:
- Edison Electric Illuminating Company:
 - Arsenal service contract, 1091.
 - Charge for broken lamps replaced, 1093.
 - Effect of fuel order on, 162.
 - Interconnection plan, benefits from, *1191.
 - Seeks postponement of rate case until end of war, 1053.
 - Underground laterals installed for immediate service only, 52.
 - Street-lighting rates reduced, 532.
 - Third Liberty loan parade, 737.
- Brakes, magnetic, Westinghouse, *127.
- Brass melting, electric, present status of. By H. M. St. John, 1043; I, 1129; II, 1216.
- Brazing torch, electric-gas, Tyler Mfg. Co., *1348.
- Bucket, clamshell type, motor-operated. Hayward Co., *283; Blaw-Knox Co., 1010.

Bureau of Standards:

- Relation to illuminating engineering, 814.
- Busbars:
- Copper busbars, current capacity of. By F. M. Billhimer (D.), 627.
 - Mounting for transformer buses, *983.
 - Single-bus system that serves purpose of double bus, *984.
 - Supports with adjustable base. Lewis & Roth Co., *855.
- Bushings, cabinet, that snap into place. J. J. Duck, 1063.
- Business conditions. (See Foreign trade, Statistics and Trade conditions.)

C

Cable end-bell flange type. Electrical Engineers' Equipment Co., *854.

Cables. (See Wires, wiring and conduit.)

California:

- Construction to get gas fuel, 585.
 - Co-operation of electrical men, 679.
 - Interconnected systems. By J. P. Jollyman, *1020; comment, 1017.
 - Interconnection of transmission systems, 218, 374.
 - Los Angeles aqueduct power to save oil consumption, 527.
 - Pooling to relieve power shortage, 1281.
 - Power contract between Pasadena and Southern California Edison Co., 946.
 - Power resources in Southern California. By H. A. Barre (D.), 939.
 - Water-power development a necessity. By John A. Britton, *15.
- California Association of Electrical Contractors and Dealers' meetings, 1039.

Canada:

- Availability of energy for heat and power. By John Blizard (D.), 834.
 - Electric power conditions, 1386.
 - Fuel consumption, reduction of. By J. M. Robertson (D.), 939.
 - Montreal tramways, power distribution for (D.), 678.
 - Pumping stations. By G. Kuhne (D.), 939.
 - Southern Canada Power Co., growth of (D.), 677.
 - Water powers and their relation to the fuel situation. By J. B. Challies (D.), 988.
 - Workless day order, 319.
- Canadian Electrical Association, annual meeting, 1386.

Car-loading machine, Link-Belt Co., *178.

Carbon, amorphous, structure of under X-ray examination (D.), 106.

Carbon cell, experimental. By S. Albert Reed (D.), 990.

Cargo winches, electric. By E. F. Whitney (D.), 367, (D.), 678.

Catalog sizes and paper standardization, conference, 1288.

Cells, standard, substitutes for, 412.

Central stations. (See also Hydroelectric developments, Transmission systems.)

—Alabama Power Co. Warrior River Steam Plant. By W. B. West (D.), 886.

—Attleboro (Mass.) substation supersedes steam plant, *1187.

—Buenos Aires:

- Power supply in (D.), 1045.
- Tres Sargentos substation (D.), 940.

—Bulk-supply generating station at coal mine, *292; comment, 291, *344; comment, 341.

—Central Illinois Public Service Co. line-synchronizing stations of, *305; comment, 290.

—Chile Exploration Co. power house (D.), 314.

—Cincinnati (Ohio) Union Gas & Elec. Co. West End Power Station (D.), 989.

—Columbus (Ohio) Ry., Power & Light Co. new generating station, *450; comment, 447.

—Commonwealth Edison Co. Northwest generating station, *928; comment, 914, *975.

—Connecting two dissimilar systems at Memphis, Tenn., 934.

—Construction cost of medium-size station, 830.

—Dominion Power & Transmission Co., Ltd., steam plant at Hamilton, Ont., *818; comment, 809.

—Georgia Railway & Power Co.:

- Adapting existing lines to increased load. By E. B. Hook, Jr., *39.

—Germany:

- Hanover steam station (D.), 159.
- Interconnection of generating stations, 110.

—Long-distance transmission plans. By F. Neithammer (D.), 55, (D.), 626.

Central stations. (Continued)

- Great Britain:
 - Electric power supply. By Leon Gaster (D.), *782.
 - England, power supply (D.), 677, (D.), 731; comment, 238.
 - Interconnection, in the west of Scotland (D.), 677.
- Hamilton (Ont.) steam plant, *818; comment, 809.
- In Japan, status of, 872.
- Interconnection. (See under Transmission systems.)
- Joliet (Ill.) plant, *146, *193; comment, 185, *242.
- Kansas City Light & Power Co. new plant, *321.
- Massachusetts systems, interconnection of, *448.
- Minneapolis General Electric Co. substation, *891.
- Narragansett Electric Lighting Co. 45,000-kw. turbine, *317.
- New Bedford (Mass.) Gas & Edison Light Co. new station 1, *396; comment, 394, II, *771; comment, 758.
- New York & Queens Electric Light & Power Co., change-over from two-phase to three-phase. By H. C. Dean, *1034; comment, 1018.
- Philadelphia Electric Co. Chester station, *1223.
- Public Service Company of Northern Illinois, Joliet plant, *146, *193; comment, 185, 242.
- Puget Sound Traction, Light & Power Co. White River development. By F. Schmidt (D.), 731.
- Rand Power Companies, South Africa, system. By Bernhard Price (D.), 885.
- Rochester (N. Y.) Ry. & Light Co. new station. By P. B. Findley (D.), 886.
- San Joaquin Light & Power Corp. outdoor substation at Madera. By L. J. Moore, *718; comment, 707.
- Small plant interconnection, benefits from, 449.
- South Africa, Rand Power Companies, system. By Bernhard Price (D.), 885.
- Southern California Edison Co., physical data of. By H. A. Barre (D.), 886.
- Southern Canada Power Co., growth of (D.), 677.
- Tri-City Company, Moline plant, *1023.
- Turners Falls (Mass.) steam relay plant and hydroelectric development, *931.
- Washington (D. C.) utilities, war expansion of, *1179.
- Windsor (W. Va.) plant, American Gas & Electric Co., and West Penn Power Co., *292; comment, 291, *344; comment, 341.

Central station business and sales management:

- Analysis of income, method employed by Rochester company, *261.
- Appliance business:
 - Increases as servants take up factory work, 882.
 - Payments method of handling with regular meter service bill, 571.
 - Repair frauds, scheme for preventing, 467.
 - Sales pushed by New Orleans company, 938.
 - To offset daylight-saving loss, 1144.
- Arsenal service contract, 1091.
- Bill delivery, war-time methods, 562.
- Bill form which aids in collections and bookkeeping, *781.
- Billing by machine makes large saving, *259.
- Billing expense reduced by use of rubber stamps, *572.
- Brass melting load. By H. M. St. John, I, 1129; II, 1216.
- Cartoon helps complaint department, *520.
- "Cash-and-carry" plan applied to light bills, *520.
- Changing a power contract to obtain greater profit, 985.
- Classification of kilowatt-hour sales, Rochester Co., 207.
- Classifying customers, comment, 1122.
- Collecting statistics from customers' account. By G. R. Kenny, 774.
- Collection method, Indiana Ry. & Light Co., *833.
- Combination gas and electric billing, *468.
- Commercial Section report, N. E. L. A., *1265.
- Comparing gas and electric service, 884.
- Contract for electric service for workmen's houses, 1092.
- Credit and collection prospects for 1918. By M. A. Curran, 97.
- Credit department's relations with customers, 53, 623.
- Customer's accounts, reducing expense of handling, 730.
- Customers' deposits, objections to enforcing rigidly, 729.
- Customers grouped according to rate schedule, 1277.
- Daylight saving effect on residential lighting, *833.
- Delinquent accounts reduced by 80 per cent, *937.
- Doherty power men sell small appliances, 154.
- Domestic appliance sales, increase in, 208.

Central station business and sales management: (Continued)

- Electric appliance market, trend of, 208.
- Electrochemical loads, possibilities, 521.
- Energy consumption of small power customers, *1379.
- Energy earnings and output, October, 1917, *26; November, *254; December, *463; January, *725; February, *932; March, *1139.
- Fixture campaign, bonus and penalty system for salesmen, 312.
- Flatirons loaned to conserve coal, 312.
- Flat rate service stopped to prevent energy waste, Worcester Electric Light Co., *884.
- Fuel conservation in hydroelectric territory, *156.
- Gratuitous repairs and deliveries curtailed by Commonwealth Edison Co., 312.
- Guarantee deposits, temporary receipts for, *573.
- House-wiring campaign, some indirect benefits, 779.
- House-wiring contracts, granting credit upon, 730.
- Hydroelectric company advertises fuel saving, *625.
- Illumination demonstration room, 156.
- Lighting curtailment, economics, 1265.
- Line extension, income of 50 per cent of cost required by Pacific Power & Light Co., 311.
- Load factor basis for purchasing electricity, *1378.
- Load, relation of to coal situation, By J. R. Cravath, 1359; comment, 1354.
- Lobby of central station building designed to attract customers, *102.
- Maximum demand, factors affecting determination of, By Chester I. Hall (D.), 575.
- Minneapolis General Electric Co. new headquarters designed to attract customers, *102.
- Motor and wiring order credits, method of handling, 937.
- Motor stock an asset in securing power business, 157.
- New-business department:
 - Changes in methods brought about by war, 1214.
 - Curtailment policy, 155.
 - Of Public Service Co. of Northern Illinois, 676.
 - Outlook for 1918, 259.
 - Program planned to increase future business, 103.
 - Trade acceptance helps, 1379.
- Off-peak service, By J. R. Cravath, 1360; comment, 1354.
- Output of large generating systems in U. S. and Canada, 618; comment, 601.
- Past-due accounts, methods to collect, 53.
- Peak equalization, 1265.
- Power bill paid by sale of wood waste, 208.
- Power contracts, legal status of, 1044.
- Power salesmen's opportunity for developing appliance load, By H. V. Coffey, 313.
- Pumping installation, points to consider, 521.
- Raising rates to meet higher costs, Minn. Gas & Elec. Co., 844.
- Range business growing in small cities, 571.
- Range policy affected by power shortage, 882.
- Range sales situation, 1918 outlook, 519.
- Range sales, ten vital points for, By F. J. Allen, 1327.
- Rate advance announcement, 467.
- Rates for electrical energy based on individual power factors, By P. Bouchet (D.), 523.
- Residences and commercial lighting customers' consumption analyses of, *1326.
- Return post cards which get away from stereotyped phraseology, *675.
- Rural service in Wisconsin, data on, *985.
- Sales bulletin for employees, *625.
- Sales department expense, classification of, 1325.
- Sales departments relations with customers, 311.
- Selling field, war's influence on, 1214.
- Service and meter record cards of Beloit (Kan.) utility, *938.
- Service bill with advertising and discount coupons, *936.
- Service, study and analyze cost of, By Gerard Swope, 838.
- Small power business, development of, 155.
- Standardizing the 50-watt tungsten in New Orleans, 1091.
- Steam and electric production costs, By J. A. McHollan, *513.
- Stickers to help collections, *832.
- Summer load, economic aspects of, I, *1084; II, *1134; comment, 1123.
- Thawing frozen pipes, rates for, 363, 467.
- Transformer sizes, salesman's assistance in selection of, By A. G. Drury, 1276.
- "War load," analysis of, 1212.
- War service, 1212.

Central station management:

- Amherst (Mass.) substation sold with provisions protecting stockholders' interests, 971.
- Appliance load, effect of on outlying residential districts, 1379.

Central station management: (Continued)

- Appliance sales commission fund for the salespeople, 967.
- Coal conditions, *136, *188, *214, *240, *266.
- Continuous meter-reading a war measure plan of Beverly (Mass.) company, 676.
- Delayed meter readings by post card, 1327.

 France:
 —Fire insurance premiums on electric plants, 307.
 —Horsepower obtainable from French rivers (D.), 628.
 —Hydroelectric development and university instruction (D.), 784.
 Frequencies:
 —High, losses in sheet iron at. By Marius Latour (D.), 1096.
 —Master clock for standardization of. Warren Clock Co., *1294.
 —Unification of. By Ulisso del Buono (D.), 574.
 Fuel. (See also Coal, Oil, and Gas.)
 —Cinders for fuel in Germany, 458.
 —Conservation by closing private plants, 529.
 —Efficient utilization for central stations (D.), 1045.
 —Emergency substitutes for coal. By J. F. Springer (D.), 368.
 —Famine, 1917. By J. D. A. Morrow, *8.
 —Low grade:
 —Methods for efficiently utilizing. By H. G. Barnhurst (D.), 56.
 —Powdered coal, experience with. By A. E. Macinnis, *1032; comment, 1018; by F. P. Coffin (D.), 1045.
 —Substitutes for coal and oil used by Pacific Coast companies, 861.
 Fuel Administration:
 —Coal outlook critical, 1282.
 —Control of oil taken over, 319.
 —Plans to promote fuel conservation, 1154.
 —Power and light, war conservation of. By Charles E. Stuart, 1181.
 —Power plant conservation plan, 1052.
 —Utilities urged to store coal, 1312.
 Fuel oil. (See under Oil.)
 Fuel-oil burners. By J. F. Springer (D.), 887.
 Fuel order, 161, *214; text of, 217, *216.

Furnace, electric:

- Annealing furnaces, pyrometer system for. By W. P. Thomas, 152.
- Faraday Society discussion (D.), 835.
- Feeding monophasic ovens from three-phase networks (D.), 1380.
- First steel-melting furnace in South Africa. By W. Buchanan and George H. Stanley (D.), 835.
- Five-wire supply for, 776.
- For brass melting, 1043; (D.), 1046.
- For brass melting. By H. M. St. John, I, 1129; II, 1216.
- For making ferro-alloys, 566.
- For melting ferro-manganese (D.), 470.
- High temperature processes and products (D.), 783.
- Kjellin type, small. By Geo. H. Stanley and W. Buchanan (D.), 1147.
- Operative data, 780.
- Papers presented at Chicago meeting of A. I. E. E. and Western Society of Engineers, 477.
- Relative advantages of different types. By Dwight H. Miller (D.), 941.
- Small furnaces and their uses. By Chas. R. Darling (D.), 106.
- Steel-melting furnace in South Africa (D.), 315.

Furnaces. (See Boilers.)

Fuses:

- Assuring satisfactory operation, *763.
- Four-in-one cartridge type. Atlas Selling Agency, *387.
- Renewable. Chicago Fuse Mfg. Co., 179.
- Renewable cartridge type. Trico Fuse & Mfg. Co., 126.
- Testing outfit, *983.

Fusing:

- Circuit breaker is adapted to the current capacity and fuse of much greater capacity used for short circuit dangers. By E. C. Parham, 415.

G

Gage for testing wooden pins, *1088.

Gage, master-pilot pressure type. Ashton Valve Co., *751.

Garage

- Air-pressure outfit automatic. M. L. Bastian Auto Engineering Co., *387.
- Combination air compressor and grinder outfit. United States Air Compressor Co., 595.

Gas, electric purification of. By J. Saget (D.), 782.

Gas-engine troubles and remedies. By A. L. Brennan, Jr. (D.), 421.

General Electric Co.:

- Employees buying Liberty Bonds, *889.
- Labor arbitration at Schenectady plant, 1387.
- 1917 business, 890.
- Secretary Daniels addresses employees, *1331.

General War Service Committee of the Electrical Manufacturing Industry:

- Collecting war data from electrical manufacturers, 531.
- Conservation of industrial resources, 318.
- Report of. By Robt. K., 1317.
- Wire and cable group, work of, 213.

Generating plants. (See Central Stations; Industrial Plants; Mines; Office Buildings.)

Generators. (See also Dynamos and Motors.)

—Alternators:

- Calculation of the non-sinusoidal effective cmf. By H. Pecheux (D.), 732.
- Polypase type, armature reactance of. By F. S. Newbury (D.), 885.
- Reactance of and its applications, 1373.
- Salient pole, sustained short-circuit phenomena and flux distribution of. By N. S. Diamant (D.), 1219.
- Single-phase, armature reaction in. By F. D. Newbury (D.), 1328.
- Sudden short circuits. By N. S. Diamant, I, *1029; comment, 1019; II, *1126, 1366.
- Voltage limitations. By F. D. Newbury (D.), 1380.
- Armature. Listed alphabetically.
- Characteristics, for speed variation. By W. B. Kouwenhoven, *138.
- Design of. By Stanley Parker Smith (D.), 469, (D.), 574, (D.), 677, (D.), 834.
- Induction type:
 - Characteristics of (D.), 1146.
 - With phase advancers (D.), 1094.
- Maximum rating, factors that determine. By F. T. Hague (D.), 574.
- Operating temperatures in. By H. D. Stephens *663; comment, 654.
- Rotor cores, design of. By William Knight, *91.
- Steam for extinguishing fires in windings. By M. A. Savage (D.), 262.
- Turbo-alternator rotors, design and specification. By S. F. Barclay (D.), 885, (D.), 939, (D.), 1094, (D.), 1146.

Georgia Railway & Power Company:

- Adapting existing lines to increased load. By E. B. Hook, Jr., *39.
- Motor stock an asset in securing power business, 157.

Germany:

- Aluminum production (D.), 1381.
- Bavaria, water-power development (D.), 886.
- Central-station interconnection, 110.
- Copper supply (D.), 1381.
- Electric supply restrictions (D.), 262.
- Hanover steam central station (D.), 159.
- Intensive electric development after the war (D.), 106.
- Long-distance transmission plans. By F. Niethammer (D.), 55, (D.), 626.
- Substitutes in electrical industry (D.), 1219.
- Glasses for protecting eyes from injurious radiations. By W. W. Coblentz and W. B. Emerson (D.), 1146.

Government service:

- Army engineers, how to join, 668.
- Engineers in, *20, 378.
- Thirty-seventh U. S. Engineers, *720.
- Technical men needed, 1180.
- Wages to electrical men, 869.

Graphite and amorphous carbon, structure of under X-ray examination (D.), 106.

Grates. (See Boilers.)

Gravitational factor. By Sanford A. Moss (D.), 990.

Gravitational repulsion. By Francis E. Nipher (D.), 471.

Great Britain:

- Coal conservation committee report (D.), 264, (D.), 1094.
- Electric power supply. By Leon Gaster (D.), *782; (D.), 1278.
- England:

- Central station conditions and restrictions, 1177.
- Electric power supply (D.), 677; (D.), 731; comment, 238; (D.), 1094.
- Engineering progress, 840.
- Intensive developments of electric power after the war (D.), 106.
- Keadby railway and bridge signaling and interlocking of. By Jas. Benj. Ball (D.), 835.
- Lighting control by Ministry of Munitions (D.), 209.
- Restrictions on electrical purchases, 1187.
- Transmission and distribution conditions, plans for improvement (D.), 885.
- Scotland, west, interconnection of transmission systems (D.), 677.
- Water power in British Isles. By Alexander Newlands (D.), 887.

Grinder, electric, for laboratory use. Robbins & Myers Co., 1348.

Ground resistance, reliability of methods of testing, 621.

Grounding practice, prevailing trend in, 829.

Grounding to water mains, inexpensive method of, 1322.

Guy anchor, cone-shaped. By M. N. Longbotham, *518.

Guy-rod head, weldless. Diamond Expansion Bolt Co., *802.

Guys, proper installation of strain insulators, *416.

H

Halifax power cable, underwater section survives explosion, 169.

Hammer, motor-driven. United Hammer Co., 1114.

Hand and face drying machine. Groton Electrical Devices Co., 959.

Harmonics in symmetrical M-phase systems. By V. Karapetoff, 660.

Heat regulator, Western Electric, *283.

Heat transmission of building materials. By A. C. Willard and L. C. Lichty (D.), 1220.

Heaters, electric:

- Air heaters, Cutler Hammer Mfg. Co., *386.
- Faucet, electrically heated. Electrical Products Corp., *1346.
- Footwarmer for outdoor service. Westinghouse, *231.
- Radiator, combination steam and electric. Electro Steam Radiator Co., 1398.
- Warming pad, small. Westinghouse, 802.
- Heating pad, electric. Wirt Co., 594.
- Heating, electric:
 - Feasible at \$12 per hp. By P. H. Mitchell (D.), 941.
 - Industrial. By E. A. Holloway, I. B. Black and E. B. Walthall (D.), 990.
 - Industrial, low-temperature. By Dwight D. Miller (D.), 941, (D.) 1147.

Heating, steam:

—Central heating plant. By F. G. Clark (D.), 1147.

Heaviside, Oliver, made A. I. E. E. honorary member, 943; comment, 913.

Hoists, electric:

—Monorail hoist for handling ashes. Link-Belt Co., *283.

House-wiring campaigns. (See under Central Station business and "Wire-Your-Home-Time.")

Hydroelectric developments. (See also Water Power.)

—Aluminum Company of America, Cheoah, Tenn., *1049.

—Apparatus to protect dam from heavy ice, 778.

—California Oregon Power Co. plant on Klamath River, 481.

—Coal saving by a study of water conditions. By Harry J. Burton, 49.

—Co-ordinating power developments and industrial applications. By J. A. Johnson (D.), 1096.

—Efficiency data of Pacific Coast company. By J. P. Jollyman (D.), 1045.

—France, emergency hydroelectric units for. By Alexander C. Clogher and Victor F. Hammel, *142; comment, 133.

—France, hydroelectric development and university instruction (D.), 784.

—Heating service, comment, 1121.

—In Bavaria (D.), 886.

—In Scandinavia (D.), 834.

—Iowa Ry. & Light Co., automatic station, 690.

—Los Angeles aqueduct power to save oil consumption, 527.

—Muscle Shoals dam, construction authorized by President, 475; comment, 497.

—Niagara Falls power houses, *865.

—Pacific Coast, interconnection and new power development. By P. M. Downing (D.), 885.

—Simplification of plants, *1367; comment, 1354.

—Steam relay plant and hydraulic development at Turners Falls, Mass., *931.

—Subdivision of waterfalls. By F. Pagliaro (D.), 421.

Hydroelectric energy as a conserver of oil. By H. F. Jackson and F. Emerson Hoar (D.), 211.

Hysteresis in iron-carbon alloys, suppression of by a longitudinal alternating magnetic field. By C. W. Waggoner and H. M. Freeman (D.), 575.

I

Ice-making. (See Refrigeration, also under Industrial applications and plants.)

Ignition apparatus, electric testing. By J. D. Morgan (D.), 575.

Illinois Electrical Contractors' Association, national organization plan, 533.

Illuminating Engineering Society:

- Active war service, 791.
- Annual convention, 785.
- Chicago meeting, 476.
- Factory lighting code revisions. By C. E. Clewell, *607; comment, 603.
- Special meeting, 426.
- Value of protective lighting, discussion, 1048.

Illumination. (See also Lamps, Light and Lighting.)

—Directing and concentrating light, survey of methods. By Lieut. Commander Haydn T. Harrison (D.), 834.

—Fundamentals of design. By Ward Harrison (D.), 988.

—Philadelphia, Independence Square. By E. F. Kingsbury (D.), 209.

—To stimulate plant growth and friction. By J. L. R. Hayden and C. P. Steinmetz (D.), 574.

Incandescent lamp fixtures. See Fixtures, Incandescent lamps.)

Incandescent lamps. (See Lamps, incandescent.)

Income tax reports, 145.

Inductance:

- Repulsion and mutual, of reactance coils with same axis. By H. B. Dwight (D.), 1380.
- Self and mutual, measurements of. By Fred E. Pinchot (D.), 56.

Inductive interference, exposed line system, remedy for, 1373.

Inductometer, variable mutual type. Leeds & Northrup Co., *854.

Industrial applications:

- Beet-sugar factories, advantages of electrification. By E. M. Ellis (D.), 575.
- By-product coke plant, power plant for. By Geo. B. Evans (D.), 210.
- Calendars, electrical control for. G. E. Co., 491.
- Cranes, motors and control for. By C. E. Clewell, *148; comment, 134.
- Fan blower and air-compressor applications. By C. E. Clewell, *196; comment, 610.
- Flywheels in motor operations. By C. E. Clewell, *400.
- Flywheels in woodworking, value of. By David R. Shearer, *968; comment, 965.

Industrial applications: (Continued)

- Graphic meters to facilitate machine tool operations. By C. E. Clewell, *544; comment, 446.
- Grinder regulator for pulp mills, G. E. Co., *543.
- Interpole mill motors vs. non-interpole. By W. R. Runner, *402.
- Machine for standardizing paintshop composing room operations, motor driven. J. E. Richards Co., 542.
- Machine grouping and power requirements in large shops, 410.
- Machinery for handling of materials, electric equipment of (D.), 211.
- Motor control eliminates fuel waste in sugar mill, *674.
- Motor drive, standardizing, increased production and economies effected (D.), 885.
- Planers, motor driven. By C. E. Clewell, *87; comment, 82.
- Power requirements in large shops, 310.
- Shipbuilding plant, motor drive for. By David Elwell, *506; comment 498.
- Shoe factory, improved motor-drive, *303.
- Silk industry, electricity in. By Ch. Vallet (D.), 989.
- Steel plant applications. By F. B. Crosby (D.), 1046.
- Steel rolling mills:
 - Auxiliary motors, selection of. By J. D. Wright, 580; (D.), 627.
 - Electric drive for. By L. Rothera (D.), 575.
 - Motor applications. By C. E. Clewell, *250; comment, 239.
 - Motors, capacity of, 580.
 - Motors, standardization of, 580.
 - Production increased by replacing steam engine, *99.
 - Reversing mill (D.), 989.
- Sugar mill, electric drive and control for, *673.
- Synchronous motors, efficiency in industrial work. By Will Brown, *604; comment, 602.
- Textile industry, motors for. By C. E. Clewell, *354; comment, 343.
- Woodworking drive problems solved. By W. A. Black, *821; comment, 809.
- Woodworking, value of flywheels in. By David R. Shearer, *968; comment, 965.

Industrial housing requirements, electrical energy for, 1276.

Industrial lighting. (Lighting, industrial.)

- Automobile tire factory, load characteristics of, *157.
- Bakery, motor drive in (D.), 1219.
- Central station service, advantages of. By W. S. Buchanan (D.), 1094.
- Distributing systems, flexible. By Bassett Jones (D.), 677; (D.), 1095.
- In Switzerland, electrical heating of. By F. Rutgers (D.), 106.
- Lighting units for. By Davis H. Tuck, 195.
- Logging and saw mills, electricity in. By E. H. Horstkotte (D.), 678.
- Motor data sheet for, *568.
- New Jersey plants, power shortage, 164.
- Quaker Oats Company, *1103.
- Shoe factory, improved motor drive for, *303.
- Steel works, labor-aiding appliances in. By S. Wellman (D.), 783.
- Sugar mills, economy of electric drive. By C. A. Kelsey (D.), 939.
- Tamarack mills power plant. By Charles H. Bromley (D.), 886.
- Westinghouse plant at So. Philadelphia, *816.
- White's South African Cement Co., Ltd. By A. Campbell (D.), 887.
- Woodworking plant, electric drive problems solved. By W. A. Black, *821; comment, 809.

Industrial preparedness. (See Preparedness.)

- Industrial specialization of engineers. By E. Piernet (D.), 159.

Instruments:

- CO₂ indicator. Dwight Mfg. Co., 542.
- Current transformers, method for testing. By Francis B. Silsbee (D.), 158.
- Electromagnetic-clutch indicating device. By V. Karapetoff (D.), 367.
- For recording sea-water salinity. By Ernest E. Weibel and Albert L. Thuras (D.), 783.
- Pyrometer optical. By Paul D. Foote (D.), 523.
- Testing instruments, small. G. E. Co., *1238.

Insulation, electric:

- Asbestos insulation, advantages of, 1275.
- Chart for determining economy of insulation. By Austen Bolam, *1275.
- Deterioration report of sub-committee on. By J. A. Koontz (D.), 941.
- Insulating material. Leatheroid Mfg. Co., 126; (D.), 159; (D.), 887.
- Insulating tubing. Fibro Products Co., 231.
- Vulcanized fiber, electrical properties of. By Wm. Eves, 3d, *190; comment, 187.

Insulation, heat:

- Sponge felt insulation, 137*
- Testing, 360.

Insulators:

- Corner insulators, armored. Westinghouse, *1167.
- Depreciation, present status of. By C. E. Oakes (D.), 732.
- Designing for best flux distribution, *1372.
- High-tension porcelain disk type. Jellery-Dewitt Co., *1062.
- High voltage, design of. By C. E. Oakes (D.), 366.
- Pin-type, standardization of. By L. M. Klauber and R. E. Cunningham (D.), 886.
- Supports, heavy-clamp. General Devices & Fittings Co., *1063.
- Wire supporter and insulator. L. F. Mfg. Co., *699.

Insurance:

- Utilities co-operative insurance. By Chas. E. Morrison, *1082; comment, 1069.

Interconnection. (See under Transmission systems.)

International trade-mark registration, 1035.

- Inventors' League of the United States, Inc., function of, 1156.

Ionization potentials for electrons in cadmium vapor. By John T. Tate and Paul D. Foote (D.), 1279.

Iron:

- Electric pig iron, cost of (D.), 107.
- Magnetization of in the absence of hysteresis. By Winthrop R. Wright (D.), 783; (D.), 1381.
- Sheet iron losses at high frequencies. By Marius Latour (D.), 1096.

Iron oxide, electrical and thermal properties. By D. C. Bidwell (D.), 470.

Italy:

- Electric traction in (D.), 55.
- Larderello generating plant. By P. Ginori-Conti (D.), 209.
- Railroad electrification. By A. Barbagelata (D.), 263.
- Using volcanic steam in energy production (D.), 1328.

J

Japan:

- Electrical industries, 137.
- New research laboratory, 576.
- Power supply, status of, 872.
- Tokio, electric exposition, 741.

Jobbers. (See Contractors.)

Jovian Order:

- Cincinnati Chapter and Electric Club merge, 222.
- New York Jovians Liberty Loan campaign, *841.

K

Kinematic device for imitating performance of a. c. machines (D.), 421.

Knife-cleaning machine. Ernest Kopper, *126.

L

Labor:

- Comment, 342.
- Exemption provided for highly skilled men, *1228.
- Federal child labor statute declared unconstitutional, 1288.
- Industrial peace conferences, 428.
- Paying workers on basis of living costs. By L. B. Comstock, I, *552; II, 615; comment, 653.
- Rehabilitation of returned soldier, 1254.
- Rochester plan, 1255.
- Symposium on. N. E. L. A. convention, *1254.
- Women:
 - As substation operators, *1262.
 - For meter testing, 1261.
 - In electrical industry, *1196, 1262.

Labor advisory council, 320.

Lamp renewer, G. C. A. Mfg. Co., *1294.

Lamps, electric. (See also Arc lamps. Lamps, gas-filled, and lamps, incandescent.)

- Temporary lighting of vessels under construction. By Wm. G. Hexamer, *96; comment, 83.
- Utilizing existing poles for yard lighting, *100.

Lighting Fixture Dealers' Society of America, annual convention, 475.

Lighting, Industrial:

- Adjustable fixture American Fixture Co., 1398.
- Coal conservation versus lighting efficiency. By A. L. Powell, 709; comment, 705.
- Factory lighting:
 - As judged by daylight standards. By Ward Harrison (D.), 55.
 - Correct lighting, importance of. By A. L. Powell (D.), 939.
 - Problems. By Romain W. Myers (D.), 366.
 - Production increased by adequate lighting, 891.
 - Standardization of. By C. E. Clewell, *607; comment, 603; *665; comment, 655.
 - Wisconsin code, 995.
 - Importance of in war-time, comment, 862.
 - Indirect system in a textile plant (D.), 55.
 - Maximum illumination with minimum energy. By A. L. Powell, 709; comment, 705.
 - Ohio code, 269.
 - Production increased by good lighting, 1194.
 - Protective lighting, value of, 1048.
 - Scientific illumination, importance of. By Davis H. Tuck, 195.

Lighting, projector:

- Projector, George Cutter Co., *594; Luminous Unit Co., *699.
- Projectors, calculations in the use of. By Waldo C. Cole (D.), 366.
- Projectors, light distribution from. By Waldo C. Cole (D.), 105.

Lighting, protective:

- Effective application of. By H. H. Magdick, *1268; comment, 1303.
- For industrial plants. By Davis H. Tuck, *1137.
- Value of, 1048.

Lighting, street:

- Chicago parkway lighting system, *516.
- Concrete posts. Chicago Concrete Post Co., 335.
- Curtailment unsatisfactory in New England, 526.
- In St. Joseph, Mo., 62.
- New Orleans "white way," *297.
- Ornamental lighting. Syracuse (N. Y.) assessment methods, 1043.
- Ornamental unit. G. E. Co., *542, *543.
- Remote-control switch, *309.
- Series circuits, potential grading on, *769.
- Series circuits, steel conductors for. By L. M. Klauber, *1313.
- Utilizing existing poles for street lighting, *100.
- White-way electroliners, equipped with pull switches, *466.

Lightless night order suspended, 888.

Lightning arresters:

- For substation telephone circuits. Reliable Electric Co., 907.
- Impulsive protective gap, *1370.
- Mounting attached to building walls, *778.
- On 150,000-volt line, method of overhauling. By H. H. Cox, 48.
- Oxide-film type, *1368.
- "Resistance Multigap" type. G. E. Co. *906.
- Sphere-gap type. Electrical Engineers' Equipment Co., *1114.
- Types to use with different size transformers, 984.

Load factor, relation of to operating cost of electric drive. By D. R. Shearer (D.), 1219.

Locomotives, electric:

- Gearless, for the St. Paul. By A. H. Armstrong (D.), 835.
- Improved types (D.), 989.
- Methods of handling rolling stock (D.), 105.

Lord Electric Co.:

- Appeal to loyalty of employees on government contracts, *530.
- Selling war savings stamps to employees, *1040.

Los Angeles:

- Power distribution controversy, 1149.
- Southern California Edison Co.:
 - War-time meeting, 57.

Louisville (Ky.) Industrial Foundation, *427.

Lubrication:

- Oil economy as practiced in Germany, 256.
- Lumens versus candles. By H. Armagnat (D.), 1146.

M

McGraw, James H., on the electric vehicle as a war measure, *1264.

Magnet, C-H hand type, Cutler-Hammer Mfg. Co., *1166.

Magnetic clutch, constant-torque (D.), 782.

Magnetic standards, determination of the degree of uniformity of bars for. By Raymond L. Sanford (D.), 1220.

Magnetic tables and charts, United States. By D. L. Hazard (D.), 264.

Magnetism:

- Ultimate magnetic particle, nature of. By Arthur H. Compton and Oswald Rognley (D.), 732.

Magnets:

- Lifting:
 - By J. Reyval (D.), 989.
 - Used to recover sunken pig iron, 614.
- Manganese, electrolytic behavior of, in sulphate solutions. By G. D. Van Arsdale and C. G. Maier (D.), 990.

Measurements:

- Electromagnet moving-coil galvanometer, study of. By Ernest Weibel (D.), 1220.
- Obtaining power factor by use of wattmeter. By E. G. Barrington, *140; comment, 135.
- Of self and mutual inductances. By Fred E. Pernot (D.), 56.
- Of small inductances and power losses in condensers. By Albert Campbell (D.), 732.
- Periodic currents, general method for studying. By John Mills (D.), 470.
- Pilot tube, use of. By A. H. Anderson (D.), 315.

Meat and food chopper, motor-driven. Enterprise Mfg. Co., *1346.

Merchandising methods. (See Central station business.)

Mercury-vapor lamp for ultra-violet light. RUV Co., 491.

Meters:

- Demand meter that operates on thermal storage principle, 412.
- Direct-current type:
 - Arrangement for testing. By J. M. McClurg, *674.
 - Temperature effects in. By G. W. Stubblings (D.), 783.
- Electric supply meters, selection of (D.), 523.

Meters: (Continued)

- Electrometry, three devices for use in. By E. H. Kennard (D.), 783.
- Foot-candle meter facilitates enforcing lighting legislation. By C. E. Clewell, *607; comment, 603.
- For measuring coke-oven gas. Cutler-Hammer Mfg. Co., *438.
- Graphic meter as an aid to the analysis of machine tool operations. By C. E. Clewell, *454; comment, 446.
- Humming, cause and remedy. By George M. Hewitt, 1089.
- Induction type, adapting to different frequencies. By E. L. Fischer, 457; comment, 447.
- Outdoor meter boxes. Safety Meter Box Co., 750.
- "Phantom" load, portable, for testing watt-hour meters. Western Electro Mechanical Co., *646.
- Power-factor d.c. calibration of. By Thos. W. Varley, *248; comment, 237.
- Prepayment watt-hour type. G. E. Co., *1294.
- Steam-flow, special calibration of, *1041.
- Testing apparatus arranged into single compact unit saves labor, *727.
- Testing at two power factors. By Joseph N. McClurg, *361.
- Testing panel for single or polyphase meters. By Joseph N. McClurg, *361.
- Watt-hour meters, shop versus field testing, 1041.
- Wavemeter, calibrating (D.), 159.

Metric system:

- Adoption urged in Great Britain. By Harry Allcock (D.), 835.

Mica:

- Electrical conductivity of. By Edouard Branly (D.), 264.
- Microscopical structure and behavior. By James Scott (D.), 315.

Military camps. (See Cantonments.)

Mines:

- Electrical operation of coal mines, 839.
- Mining machines, electrical. By F. Robin (D.), 367.

Minnesota Electrical Association, war-time convention, 451, 579.

Missouri Association of Public Utilities, convention, 1054, 1102.

Montreal, Canada, tramways, power distribution for (D.), 678.

Motion-picture appliances:

- Arc regulator. Barlow Electric Specialties Co., Inc., 751.

Motion-picture projection:

- Gas-filled lamps for. By R. P. Burrows and J. T. Caldwell, *766; comment, 758.
- Regulator for Mazda lamps. Argus Lamp & Appliance Co., *1010.
- Rheostats for. Ward Leonard Electric Co., *1346.

Motor-generators:

- A.c. to d.c. "Compensarc" equipment, G. E. Co., *386.
- Bearing pitting, cause and remedy, 1322.
- Locating trouble. By E. C. Parham, *568.
- Mounting set on station wall, *776.
- Unit type for battery-charging and signal work. Electric Specialty Co., 179.

Motors (See also Dynamos and Generators):

- Alternating current:
 - Adjustable-speed type, analysis of (D.), 420.
 - Asynchronous with short-circuited rotors. By J. A. Montpelier (D.), 1094.
 - Multi-value overload relay type. Monitor Controller, *1167.
 - St. Louis Electrical Works, *126.
 - Single-phase type. By Gordon Fox (D.), 677.
- Armature (Listed alphabetically).
- Asynchronous, with high power factor and controllable slip. By R. V. Picou (D.), 988.
- Automatic starting of motors of medium rating. By Pierre Legrand (D.), 782.
- Buffing and grinding motors. Bodine Electric Co., *1114.
- Commutator machine as the standard single-phase type. By F. Creedy (D.), 1278.
- Construction and characteristics. By Gordon Fox (D.), 1095.
- Direct-current:
 - Output coefficients for. By E. W. Kellogg, *347; comment, 342.
 - Winding troubles. By Gordon Fox (D.), 939.
- Domestic motor. A. C. Gilbert Co., 647.
- Flywheel effect in motor operation. By C. E. Clewell, *400.
- For fans and blowers. By C. E. Clewell, *196.
- For shipbuilding plant. By Davis Elwell, *506; comment, 498.
- For small power appliances, need for, comment, 1070.
- For steel-mill operation. By C. E. Clewell, *250; comment, 239.
- For textile mill operation. By C. E. Clewell, *354; comment, 343.
- For traveling cranes. By C. E. Clewell, 148; comment, 134.

Government Control of Power

GOVERNMENT control of the supply of power in some communities is not now a matter of academic discussion, it is a fact. That this is so is no surprise to foreseeing observers. It has been long ago forecast in these columns and has been hastened by the tremendous needs of the war industries, by the dangerously progressing margin between the quantity of power produced and the quantity of power wanted, and by the apparently insoluble problem of getting the necessary coal out of the mines and moving it without delay to the points where it is wanted.

Now that the situation has developed to the extent where a system of virtual priority is in effect in some cities and the national need for power is very acute, it is high time to make clear again the critical nature of the emergency that confronts us. In brief, we have the war forces of the government bending every resource with vigor to hasten the manufacture of munitions. We have another government agency in responsible control of the conditions of coal production and, in general, coal distribution and allocation as between different classes of clamoring consumers. The Fuel Administration effort is now supplemented by complete federal control of railroad operation. The sum total of these factors is that we have the government, through those who are producing munitions for it, as consumer, and we have the government as the supreme authority over coal supply. All that is required of the steam electric central station is that it shall take the coal supplies which the government will provide and convert them into the energy which the government (or those to whom it awards contracts) will buy.

The field of activity is thus so narrow that the central station will have to move diligently and with extreme circumspection in order to measure up to the exacting standards that the nation sets. Its aim will be to serve the national interest. If the government orders it to furnish power to certain industries and compliance means cutting off other consumers, there is no patriotic course but to obey. Such an order means discrimination under the state law.

When because of urgent war needs the federal authorities order discrimination they should be asked to put their requirements in writing. Companies will find

it advisable to take up with the public service commissions all questions involving discrimination under state laws. These commissions will act as patriotically as any citizens, but their action will keep the records straight for the lawyers or courts in case of future question. The main thing will be to divert the power unhesitatingly, as the government desires to have it done, but, in doing that, the companies will want clear authority for all drastic steps.

Transportation and Fuel Supply

THE United States government has tackled the biggest job of its career in taking over the railroads. It can thus effect a working merger far closer than anything which would have been permitted to the railroads themselves, and much more efficient, because the question of funds for adequate supply of rolling stock is thereby automatically settled. We earnestly hope that one of the immediate results will be the clearing up of the fuel transportation difficulty, for which no effective cure has hitherto been found. A shortage of fuel in these times is perfectly understandable, yet a breakdown of fuel transportation so serious that factories have to close, schools shut down and power plants run on reduced output is a state of affairs that, broadly, is not excusable. It is now rigorously up to the government to take hold with a firm hand and put its task through even if it has to commandeer the coal mines and enlist the miners to do it.

Every patriot, whether he theoretically believes in government ownership or not, must recognize that it gives opportunity for efficient action which is well worth the while, and should give it full support even to the extent of forgoing the inalienable right of grumbling at inconveniences. These there will undoubtedly be in the rearrangement required to do effectively the things which are necessary. We in this country have yet to learn the lesson that war is a serious business to which private prejudices and interests must give way. We believe that the government by this step will be able to carry out the work of national defence as it could not possibly have carried it out otherwise, and at a speed utterly impossible so long as the transportation systems were not welded into one coherent whole.

Developments in Electrical Industry in 1917

Very Little Progress Made in the Art—Every Energy Bent on Increasing Production and Keeping Essential Industries Going

NO GREAT amount of space is necessary to record the scientific and technical achievements of the past year. With a world-wide war on our hands and with the electrical industry straining every nerve and muscle to meet demands in the face of shortage of labor, material, fuel and transportation, advances, save in isolated cases, have been out of the question. Development has taken place rather in the direction of increased production or the same output against heavy odds.

GREAT PRODUCTION OF ELECTRICITY

The central-station industry turned out more electricity than ever, despite serious handicaps for want of fuel and apparatus in addition to a lack of money for betterments and extensions. Statistics gathered by the ELECTRICAL WORLD indicate that the total central-station output for the year was approximately 27,000,000,000 kw.-hr. More than half of this energy, and we record this with pride, was developed from water power. To develop the rest in steam stations required approximately only 4 per cent of the country's total coal supply, but great difficulty was experienced in securing that small percentage. By and large, the quality of central-station service has not been permitted to deteriorate, although the great bulk of energy is still being sold at the regular pre-war rates. In some instances increased rates have been allowed.

MANUFACTURERS OVERLOADED

Manufacturers of electrical apparatus and supplies have been busily engaged in turning out equipment, but have been unable to meet even very urgent demands. The government has been a large buyer. In fact, the demands of the government upon electrical manufacturers have caused many to subordinate all developments in other directions. Some manufacturers are working 100 per cent in excess of their previous maximum output, the pressure being in part for electrical products and in part for munitions and other war supplies.

JOBGING CONDITIONS EXCELLENT

The year 1917 was the most prosperous in the history of the electrical supply business. This has been particularly true in the industrial centers. The net merchandise profit by reason of increase in values has been larger than for many years past, and the constant rise in values of all merchandise except copper has given an additional and very substantial warehouse profit. During the first six months of the year particularly, the number of orders handled, which after all is a truer indication of the health of the business, showed a substantial increase over the similar period in 1916.

The electrical supply jobbers face the year 1918 with the sure knowledge that building operations as a whole, outside of construction for government purposes, will be approximately 50 per cent of normal, with a corresponding decrease of about 50 per cent in the purchas-

ing power of the contractors. The financial needs of the government, coupled with the uncertainty as to demands of labor for higher wages, will make it difficult for public utilities to secure money for extensions except at a very high rate. This naturally will be reflected in less new work and fewer extensions, with a corresponding decrease in purchases.

BROADER FIELD FOR CONTRACTORS

During the year the electrical contractors have broadened their organization plans by the adoption of a new constitution and by-laws, which have since been ratified by enough state organizations to bring into existence the National Association of Electrical Contractors and Dealers. The organization seeks better standards of practice among contractors, better trade relations between the various national bodies, and, above all, will strive to make the contractor himself a better merchant. Normal electrical contracting work suffered a decline during the year for obvious reasons.

RESEARCH WORK

Research has made good progress, although the lines of endeavor have been considerably different from what they would have been had we not entered the war. As it is, many research men have been devoting their energies to solving war problems, and while it is manifestly impossible to give out results of this type of research, we know that splendid progress has been made. The devotion and energy displayed by research men who are giving their time, many practically without compensation, to government work is most inspiring. In many lines it has been found necessary to do intensified research work to provide substitutes for materials which have been withdrawn from the market or which have become unduly expensive. In fact, the direct war research work is no more important than the indirect work in providing industry with the ways and means of keeping production going in spite of abnormal conditions in regard to materials, etc.

TURBINES AND WATERWHEELS

Experience in the last twelve months indicates that the tendency on the part of operators to purchase steam-turbine units of large capacities will continue. With a view to improving economies still further in addition to increasing the size of the units, the present drift is in the direction of high steam pressure with superheat. This necessitates a more extensive use of cast steel and bronze alloys not subject to the growing action experienced in cast iron subject to higher temperatures. The lines of small steam turbines have been improved in the standardization of the several types. Superfluous sizes and frames have been eliminated, except that certain special designs have been quickly developed and are being supplied to the government in large quantities. Considerable progress has also been made in the adoption of the small steam turbine to very high-temperature steam.

Waterwheel business has fallen off during the past year. However, on account of the scarcity and high price of coal and the growing conviction that if coal is to be conserved the water powers of the country must be developed, renewed activity in hydroelectric developments is anticipated. The falling off in waterwheel business has been due to lack of new developments, reconstruction work remaining about the same, while more extensions were made in 1917 than in 1916. A test recently made on a 5250-hp. horizontal water turbine installed in a paper mill in Maine showed a maximum efficiency of 92.3 per cent. This is considered to be the highest efficiency that has ever been obtained in a horizontal unit. A vertical unit, it will be remembered, showed on test several years ago an efficiency of 93.7 per cent, this latter being, as far as we know, the highest efficiency which has ever been obtained in a waterwheel.

GENERATORS AND TRANSFORMERS

There have been no radical changes in the design of alternating-current generators other than the continued effort to understand and predict temperatures more correctly, thereby reducing the size and the cost of the machines. Even though stresses may be a serious limitation in turbo-generators in the large high-speed units, they seldom if ever are as important as magnetic saturation or temperature rise.

Transformers, especially of the high-tension type, have been a scarcity on the market during the year, and in general manufacturers of transformers have been bending all efforts to increase production. More confidence is placed in large transformer units, and during the year a 8000-kva., 44,000/6600-volt, 60-cycle, self-cooled transformer was installed in a steel mill in Ohio. This unit, both in its rating and in its over-all dimensions, is a distinct advance in the maximum size of self-cooled units. As indicative of the lack of hesitancy on the part of customers to order transformers of very large size, the case of the Detroit Edison Company may be cited. That company has a 25,000-kva. auto-transformer which will transform 12,000 volts to 24,000 volts. Being an auto-transformer, this means that the unit will control an output of 50,000 kva., an amount of power that no one has heretofore been willing to make dependent on a single static transformation.

TRANSMISSION PROBLEMS

Despite unusual conditions there has been great progress made in the manufacture of high-tension insulators. It would seem that more substantial progress has been made last year than at any other time in the last six or seven years. The realization that an insulator involves many factors other than size and weight has done much to permit development along lines which increase reliability and lower the cost of maintenance.

One of the most important problems confronting the electrical industry at the present time relates to continuity of service. It is perfectly evident that if implicit reliance could be placed on transmitted power huge steam generating stations could be more strategically located with reference to coal supply, thereby releasing many coal cars and permitting economies in other directions.

Lightning troubles we shall perhaps always have, but other line troubles are gradually being eliminated. At

the present time the cost of protective apparatus is too large a percentage of the cost of power and switching apparatus in smaller systems, and yet a small installation without protective apparatus menaces the continuity of the main power supply. During the year a new type of arrester, which has the critical voltage characteristics of the aluminum arrester and yet is entirely dry and requires no charging, has been developed. Further developments have also taken place in the building of power reactances cast in concrete.

GREAT DEMAND FOR MOTORS

In the motor market the demand for large as well as for small motors has exceeded the supply. As a consequence there has been no room for any but standard apparatus. Changes have been kept down to a minimum. In machines intended for steel mills the insulation of windings in both motors and generators has been increased so as to secure a greater margin of safety to offset the severe conditions of operation.

Owing to fuel and other conditions a great many manufacturers have turned to electric drive, thereby increasing the normal demand for motors as well as the demand for energy from central-station circuits. The pressure for standard motors is still heavy. Even with fractional horsepower motors, where the government purchases have been comparatively small, sufficient minor operations have developed in essential industries to keep up an abnormal production.

Naturally with the great demand for electric motors there is a similar demand for controllers, and the same general condition of increased production of standard product prevails in the controller field.

This year has witnessed a number of important developments in electric storage batteries, especially for government use, but under present conditions we are not at liberty to discuss these.

WIRE AND CABLES

Wire and cable manufacturers have been very prosperous during the year. The demand for wire and cable even outside of that required for government use has been very satisfactory. Of course, if money continues to be so hard to get and the prices of building materials remain so high, the public utilities will not be inclined to make extensions and normal building operations will remain at a standstill. There remains, however, a large business due to necessary extensions, and there is considerable other development work under way which will call for large quantities of wire and cable.

STANDARDIZATION

The work of standardization during the past year has been confined more to slight revisions of former standards than to any radically new line of work. Horsepower ratings have been adopted for direct-current adjustable-speed motors. Transformer rules covering distribution and power transformers have been finally approved on the subjects of kva. capacities, voltages, voltage taps, temperature rating, multiple connections, insulation tests, etc. On industrial control apparatus a set of symbols and diagrams has been approved. Terminal markings of all motors, generators, transformers and industrial control apparatus have been finally approved. Most of the work referred to has been under consideration for some time and portions of it previously approved.

Save the Power of Our Unused Streams

By FRANKLIN K. LANE

Secretary of the Interior

WHEN Benjamin Franklin caught the lightning on the tail of his kite he did a lot of strange things for this world of which we are only beginning to learn. Among these are the uses to which flowing water may be put.

The old-fashioned waterwheel, which was the motive power of our early industries, is now converted into a turbine which generates electricity, and this has as great a variety of uses as the muscles of a man's arm or a horse's shoulder.

Among the other strange things done by Benjamin Franklin was to give an added and peculiar value to the ledges of granite which confine our Western streams and turn them into dam sites, useful for purposes of power generation.

How many of these there are on public land not yet disposed of no one knows, but we have several hundred under withdrawal, and these should be freed from withdrawal and turned into use just as quickly as possible; for, as the muscle of man or horse can raise a few barrels of water from the well to supply stock or irrigate the garden patch, so can the power of the stream, turned into electricity, be used to raise millions of barrels of water to irrigate alfalfa farms or orchards. And this is now one of the most common uses of electric power in the West, and, in fact, in some of the Eastern States where irrigation is found of value.

The waters that flow down our streams are only a small portion of the rain and snow which fall.

There are streams that follow their courses underground just as clearly marked and as valuable, if once discovered, as the streams above ground. And to tap these is a part of

making America. Cheap gasoline is doing it in some places; cheap coal in a very few; but cheaper electricity is doing it in a large way.

Then, too, there is that mystifying miracle of drawing nitrogen from the air for chemical use, which can be done only with great power, but is being done in Germany, Norway, Sweden, France, Switzerland and elsewhere, and by which an inexhaustible substitute for the almost exhausted nitrates of Chile has been found.

This is already a great industry in Europe, and will by necessity become greater in the United States than elsewhere, because of

FRANKLIN K. LANE

our size and need and opportunity.

To increase the yield of our farms and to give us an independent and adequate supply of nitrogen for the explosives used in war we must set waterwheels at work that will fix nitrogen in lime. And there are still more intimate uses for this power—in places in Montana it is so cheap that it operates the churn, the sewing machine and the vacuum cleaner, and supplies light to the house and fuel to the kitchen range. Indeed, for the possible uses of electricity there is no measure.

In order to put into use the potential power of our streams we must have legislation under which the withdrawn lands may be availed of and the power sites on our streams developed.

To Save Fuel Use the Central Station

A Statement by the United States Fuel Administration,
prepared for the ELECTRICAL WORLD

FUEL saving through the conservation of electric power is one of the many important problems before the United States Fuel Administration. The order putting into effect two "lightless nights" a week has resulted in a substantial saving of coal—approximately 250,000 tons a year will be saved according to the best available figures.

In recent letters sent out by Fuel Administrator Garfield state administrators have been urged to obtain the co-operation of all electric public utility concerns in the elimination of all wasteful uses of electricity. Many of the state officials have reported that large savings have been effected already and that plans are under way for further conservation.

One of the most vital suggestions yet to come before the Fuel Administration has to do with the shutting down of the small isolated plants furnishing electrical energy. The largest and best managed electric light and power stations that are burning coal are using it with the greatest economy known in engineering practice. They have high-pressure boilers with ample heating surface, superheated steam, mechanical stokers, the most economical electric generators, steam turbines and high-vacuum condensers. They have water and steam meters, coal-weighing machines, pyrometers, carbon-dioxide indicators and recorders, and keep continuous records of their output and their coal consumption.

Considering the fluctuating demand for energy, it is not to be expected that by any

changes of apparatus they can make any further important saving of coal.

The smaller stations and those that are not up to date in their equipment and methods of management can, however, make a great saving of coal by acquainting themselves with what is being done in the best plants and by copying them as far as possible. Hourly records of output and of coal consumption should be started, and premiums for coal saving should be given to the engineers and firemen.

The coal consumption in the large electric plants per kilowatt-hour is less than half of that of the average small plant of less than 500-kw. rating. Everything possible, therefore, should be done by the large stations to cause the voluntary closing of the small isolated plant.

The way to do this is to reduce the charges for power service as far as a reasonable return on the invested capital will permit. A general overhauling of prices charged for energy should be made, reducing the figures for power to encourage the abandonment of the small isolated plant, saving half the coal used by the latter, and recouping the loss of revenue by raising the figures for light, thus encouraging customers to be less wasteful in its use.

It is a recognized fact that there is an enormous waste of coal due to the extravagant and luxurious use of electric light.

[EDITOR'S NOTE.—In pointing to the economy of central-station service the Fuel Administration, of which Dr. Garfield is the head, is following its consistent policy.]

DR. H. A. GARFIELD

Manufacturers Aiding the Nation

Their War Machine for Freedom and Democracy Is a Connecting Link Between the National Forces and the Electrical Manufacturing Industry

BY ROBERT K. SHEPPARD

Representative of the Associated Manufacturers of Electrical Supplies on the General War Service Committee of the Electrical Manufacturing Industry

IT HAS been an old American adage that "time is money." To-day time is measured in lives, not money. Because our unit has changed, because time measures itself in the lives of the boys "over there" and yet to cross to France, it is clearly the duty of the electrical manufacturing industry to find the way in which time can best be used to give the aid that our nation must have if we are to win the war.

The electrical manufacturing industry is not alone in recognizing the critical nature of the emergency. A multitude of other industries have formed their war service committees.

The Advisory Commission of the Council of National Defense did a splendid, unselfish job. The preliminary work of that and other agencies and individuals is bearing fruit, and systematic mobilization of all industries is steadily progressing to a war basis. A sympathetic observer sees this when he visits Washington, and it gives courage to go forward with one's fellow manufacturers to build up machinery for helping the government with all of the facilities that we have.

The General War Service Committee of the Electrical Manufacturing Industry is to make a connecting link between the industry and the tremendous forces, now gaining headway in Washington, created to see that the national government gets what it needs. As a focus for the smaller committees representing groups of manufacturers the general committee will act to co-ordinate the different movements and make the composite result most effective.

As an example of the kind of work that is to be done by group committees, we have the results accomplished by the wire and cable group. What it is doing illustrates the kind of co-operation that we ask from each of the group committees of the industry. The basis of success of the wire and cable group is the unswerving loyalty of the manufacturers behind the group. They have said to their group committee: "You are the commander, we are here to obey." It is that kind of co-operation that we must provide back of the group committees and, therefore, back of the general committee.

IT IS A PATRIOTIC JOB

The committees are sure to be effective. This is a war emergency. The job is something that is patriotic, that will provide the channels through which each can expedite the total productiveness of business much more rapidly than any other known method.

Some manufacturers have found as the war has developed—more will find as time passes—that there is a change in the sources from which business is obtained. Mill conditions which were regarded as balanced are no longer so adjusted, because the demand is super-normal for some products but has become sub-normal for others. George N. Peek has been placed in charge of the industrial division of the War Industries Board

in Washington, so that working through the various war service committees of American industries he may systematize the conversion of facilities which are idle to-day or would be idle next month or next summer and make them of value for the business of war.

We who are serving on the general committee—and I feel that I may speak also for the members of all of the committees—are conscious that we are doing this work because the business of war requires that it be done, not because we individually think that it ought to be done. It is done because the manufacturers agree that it ought to be done. They believe that it is the right and best way to work out for the government the problems that touch production in our plants.

The general committee represents the industry. The group committees represent the divisions of the industry. This is not in any sense an association matter alone, because the entire industry, and not merely the association, wants to serve the nation. It is a big patriotic effort that we are making. It is costing men something to do it, and it is going to cost every manufacturer something to do his part, but it is something that will help to save our country. That is the demand, that is the aim. Production to meet the government needs is the first consideration. If the man outside of the association can produce twice as much as the man inside, give that man the business.

CLASSIFY THE BUSINESS

There are four classes of business which the industry will have to consider carefully from this time forward: First, the direct government business; second, the indirect government business; third, the essential but non-government business; fourth, the non-government and not-essential-to-the-war business. I would not call the last "non-essential business" because it helps to keep factories in operation and it means a return on our capital and taxes for the government.

These four groups should be considered searchingly when a manufacturer thinks of the way in which his plant ought to be producing. If the plant is capable of production for the government directly, it is a patriotic duty to be doing it; if it is capable of production for the government indirectly, it is a patriotic duty to be doing it; if it is capable of production for the essential but non-government business, it is a matter of just as much loyalty to be doing that and the non-essential-for-war business ought to be considered last.

It is the first two of these classes of business that mean direct payment of money by the government, the circulation of the vast sums which are being raised for the war. The third and fourth are in large measure the sources of supply of the money with which we must pay our taxes to the government. A certain amount of taxes will be levied because of our profits on government business, direct and indirect; but I have full faith

THE RAPIDLY GROWING NAVY CALLS FOR GREAT QUANTITIES OF ELECTRICAL SUPPLIES

that the great body of electrical manufacturers could not feel that they were doing right if they profiteered. Therefore, the business that is directly or indirectly for the government and the business that is essential but non-government will be done at a minimum and reasonable profit, not because the government says it should be so, but because patriotism tells the manufacturer to do it that way.

It is right that the burden of the war should be distributed, that every concern, large or small, should do its share. It is for the interest of all and for the individual interest of each one that every manufacturer in the industry shall take his share of the load.

Suppose that a manufacturer needs a million parts of a certain product because of a pressing demand from the navy. Under ordinary conditions he would know where he could get the parts. But if these parts had to be produced in say twenty working days, any one producer would be swamped. So the manufacturer would apply to the appropriate group committee of the makers of those parts. That committee would arrange with individual manufacturers to take the orders, one 50,000, one 100,000, one 200,000, etc.

Another illustration of what committees may do is mirrored in to-day's labor situation. A serious shortage may be found in one community. The manufacturer tells his group committee of his difficulty, the group committee communicates with the General War Service Committee of the Electrical Manufacturing Industry, which in turn has access to the labor division of the War Industries Board. The secretary of the general committee will consult with other group committees of the industry. The problem will be solved by finding a district in which for essential industries there is a surplus of labor and diverting that labor to the districts where shortage exists.

Another problem may have to do with the question of factory quarters. A manufacturer may be threatened by unforeseen conditions affecting the lease of his plant and does not know how to meet them. He has a certain amount of government business and knows that it is essential to the war. He feels that the problem is not big enough to interest the authorities in Washington. Under these circumstances he goes to his group committee and his group committee to the general committee. The matter is taken up with Mr. Peek, director of the industrial division of the War Industries Board. The difficulties over the lease are arranged, or a new location is found, or the problem is solved at once in some other way.

It was only a few days ago that LeRoy Clark, chairman of the wire and cable group, had a call from a man who was doing government business. The caller had tried by the usual purchasing methods to get a large amount of wire but had been unable to do it. He said: "I cannot find it. What am I going to do about it?"

Mr. Clark replied: "You get authority from some one in Washington for this group committee to negotiate with you and we will see what we can do."

The caller got the authority and the subsequent conversation was something like this: "This article in the schedule we will supply to you next week; this one in four days; this one in seven days; this one in ten days."

The entire requirement, which that man could not find in the country, was ready for delivery to him in two weeks.

These illustrations make plain the usefulness of the committee organization, the war machine which the electrical manufacturers are creating and backing, to help retain for the children of this generation and all time to come the freedom which we received as a sacred heritage from our fathers.

The Fuel Famine of 1917

With Sufficient Cars at Disposal of Coal Operators No Shortage Would Have Existed—
More Coal than Necessary Would Have Been Available

BY J. D. A. MORROW

General Secretary National Coal Association

THE year just closed has witnessed one of the most remarkable conditions in the bituminous coal industry ever known in the United States. The nation has been short of coal. Possessing the greatest resources of coal in the world, with abundant labor to mine this coal and with ample equipment at the mines to bring it to the surface, the country has nevertheless been held for weeks past in the grip of a fuel famine.

There need not have been a fuel famine in 1917; there need not have been even a coal shortage. That there was a famine, with its attendant suffering, was due solely to inadequate transportation facilities. Let us look for a moment at the facts. Bituminous coal mines of the country produced in 1917 approximately 540,000,000 tons. This was the greatest output ever recorded. It exceeded the output of 1916 by nearly 40,000,000 tons; it topped the yield of 1915 by nearly 100,000,000 tons.

Great as the output of 1917 was, it could have been greater. There is coal enough in the United States, it has been estimated, to supply the world for thousands of years at the present rate of consumption. There was labor enough in 1917 to bring this coal to the surface in volume far greater than it was brought to the surface. The mines could have met every need of the nation from the standpoint of labor and equipment if they had been permitted to operate to full production.

Plainly, therefore, inasmuch as the nation's needs were not met, something was wrong. It could not have been that there was not enough coal in the ground; the government figures show that there was, taking a general average, sufficient labor during the year to run the mines to a much larger production, and the equipment at the mines was ample to produce much more coal than was actually produced. What then was the trouble? The answer can be told in one word—transportation.

The coal was there, the labor was there, the equipment was there—but the railroad cars were not.

At least 75,000,000 tons of coal—probably 100,000,000 tons—could have been mined in 1917 that still remains in the ground for lack of adequate transportation facilities. The production of 1917 could have been in excess of 600,000,000 tons had the mines been permitted by the railroads to produce as much as they were capable of producing.

The authority of the United States government lies behind that assertion. Reports of the United States Geological Survey, gathered from every coal-producing section of the country, show that week after week lost production has mounted into millions of tons because there were insufficient cars at the mines to transport the coal as fast as it could be produced.

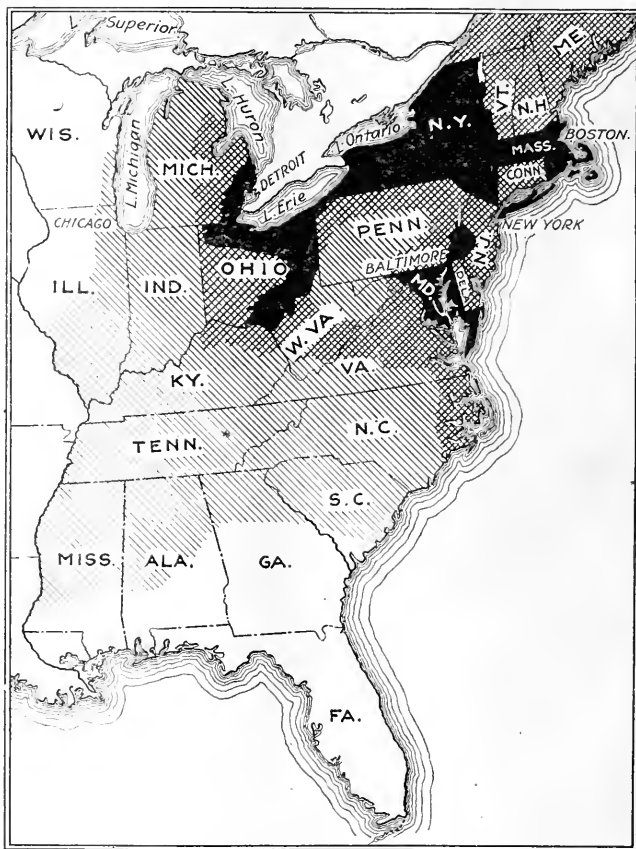

The week ended Dec. 15, 1917—the latest for which the Geological Survey returns are available—witnessed such a car shortage at the mines. The lost production of bituminous coal—and I am citing government figures—because of insufficient car supply in that week alone totals nearly 4,500,000 tons. The week before

that it exceeded 3,000,000 tons; the week before that more than 2,000,000 tons; the week before that nearly 3,000,000 tons; the week before that more than 2,000,000 tons. Thus the story goes—day after day, week after week, month after month, all during the year.

The shortage was particularly acute in some sections. In Ohio, for instance. Ohio has coal mines—enough to supply the entire State and furnish an overflow to its neighbors—yet Ohio shivered during the first cold snap.

At the moment the people of Ohio were in the grip of the fuel famine the Ohio mines were running only part time because of the lack of cars. Here is a report from one field alone in Ohio for four days of one week in which Ohio suffered most.

On Monday mines that could have produced 722 carloads of coal received only 242 cars. On Tuesday mines that could have produced 966 carloads of coal received only 270 cars. On Wednesday mines that could have

SECTION OF UNITED STATES WHERE COAL SHORTAGE WAS MOST ACUTE

produced 998 carloads of coal received only 366 cars. On Thursday mines that could have produced 1158 carloads of coal received only 320 cars. And in that same week car shortage and congestion in the Pittsburgh field caused a loss of approximately 500,000 tons in bituminous coal production.

While the Ohio and Pittsburgh mines were thus crippled the West Virginia mines were in a similar plight. Here is the lost production at 120 mines in the important Fairmont-Clarksburg section during that week: Monday, 15,000 tons; Tuesday, 33,600 tons, fifty-five mines idle all day; Wednesday, 33,700 tons, forty-nine mines idle all day; Thursday, 30,800 tons, thirty-eight mines idle all day; Friday, 40,000 tons, seventy-four mines idle all day; Saturday, 36,000 tons, forty-seven mines idle.

These illustrations are by no means abnormal. They are selected, it is true, to cover conditions during the week of the first cold snap of winter in the Middle West, because they bring home at that time as at no other the tremendous wastage in production.

It is only fair to add that during this week the railroads were crippled themselves by weather conditions. But the general situation that prevailed at the mines

then had been prevailing for some time previously, and until the government took over the operation of the railroads continued to prevail in many sections.

So far as car supply in its effect on operations of mines is concerned the mine operators feel encouraged by the centralized control of the railroads under Mr. McAdoo. They feel satisfied that sufficient cars will be supplied to keep the mines running regularly somewhere near capacity. If this is done, the producers can keep their men, because the wages now paid are the highest in the history of the industry, and compare favorably with those paid in other lines of industry.

Coal producers expect the production in 1918 to set another new high record. They understand that the war needs of the country will require even more coal than has been produced in 1917. They are entering upon 1918 determined to produce the tonnage required.

Great Progress in Electrical Activity

Statistical Records of Large Growth in the Business of Different Branches of the Electrical Industry in the Year of Entry Into the War

BY T. C. MARTIN

Secretary National Electric Light Association

ALL else that happened in 1917 is subordinated to the vital, comprehensive fact that the year witnessed the entry of the United States into the great war. How we stayed out so long will ever remain a mystery unless we explain, but not excuse, it on the ground of moral and mental unpreparedness. The period from 1914 to 1917, during which we were too proud to fight, was given up to the unprecedented accumulation of wealth; but the lesson was only learned with slow reluctance that national obligations and international duties would require now the expenditure in warfare of all that had been accumulated while Europe was bled white of every resource. The effect of the tremendous change in American feeling and action is seen more distinctly every day in the conditions of society and of industry. Unexpected revolutions are in full swing whose results will go on indefinitely after the war has stopped.

In electrical development several novel phenomena are already noted, while others begin to cast anticipatory shadows of obscure outline. No one predicted or could foresee at the beginning of 1917 what has come to pass in any branch of electricity by way of expansion or restriction. One curious feature of the times is that a tendency has been manifested to limit the use of electrical service just when the stern injunction to economize is heard throughout the land. Saving to win the war is logical, but restriction of electricity is not, since its every successful application is predicated upon some saving in time, effort, money, as against the preceding method. In fact, in its struggle to redeem and use the wasted water powers, the central station utility is at this juncture the leading exponent, after Mr. Vanderlip, of the doctrines of true economy.

INCREASE IN CENTRAL STATION OUTPUT

Any estimate of the electrical figures of 1917 is attended with more than the ordinary elements of doubt,

but as usual there are certain bases upon which calculations can be made. Thus it was assumed last January, in an article like this, that from earnings alone the central station income for 1916 had been \$425,000,000. Data available about the same time put the amount at \$417,000,000. This was larger than the 1915 total by more than 15 per cent. With some 3000 stations engaged in steam heating, ice making, the handling of supplies and other business, a large addition would be made, justifying the assumption that the total reached for 1916 of \$500,000,000 must be a fairly close approximation. A 10 per cent increase on this for 1917 would bring the figure up to \$550,000,000. The increases taken month by month would seem to justify this, especially as the gain in many months was quite considerable. Thus the increase for about 60 per cent of the industry in September, the latest month for which data are to hand at the time of writing, showed an advance over 1916 of 13.8 per cent in income and 13 per cent in output.

There is no reason to believe that output has fallen off, for many plants have been crowded far beyond their total generating capacity. Isolated plants have cried aloud to be hooked up. Industrial plants have begged in vain for a fuller allowance of energy from the circuits. The shortage of coal and the dimming of signs have come too late in the year to cause any marked present diminution in output, whatever may be the results in the next year of such conditions intensified. The long period of rate reductions would appear to have been closed; at least, rate increases have of late been more numerous. The year's net, however, may have been kept down by high costs. But the spirit and principle of economy have also been in active demonstration. Let us then assume, on the whole, for the central station industry an income of \$550,000,000. It must be remembered that, whatever may be the influences to the contrary, the uses of electric light and of

electric power multiply so fast that all accentuated economies and higher efficiencies are offset or absorbed.

ELECTRIC RAILWAY INCREASE

In 1916 the total income of the whole electric railway field was estimated at \$750,000,000. The rate of increase in street railways has not been very high of recent years, and many individual cases have been quite depressing; but the industry in the main has exhibited both staying power and recuperation. Moreover, the increase of travel with that of population goes on, and the larger employment of labor has been a marked cause in various localities of street-car crowding. This has occurred in spite, or because, of very low increase in new track or new cars. On urban lines the increase in gross has been noteworthy despite local strikes, and numerous increases in rates of fare have had their effect. A very large increase is to be noted on electrically equipped suburban sections of trunk roads and in the operation of electrified portions of such steam roads. Of course, the higher rates of wages and material have kept down the net, but the gross has certainly been 5 per cent higher and may even be 7 per cent or 8 per cent. It is fair to put the total for 1917 at \$800,000,000.

INCREASE IN TELEPHONE EARNINGS

The extent to which the conditions of the times affect electrical utilities is strikingly shown in the fact that while for the period of eight months the American (Bell) Telephone & Telegraph Company's earnings rose from \$171,608,490 to not less than \$194,337,712, the operating net income was but \$47,439,392, as compared with \$47,586,666. The whole gain of nearly \$23,000,000 was thus negated with \$150,000 more thrown in; but the gain was there all the same, and in due time the larger interest charges due to rapid increases of capital will work out to advantage. On the basis of total operating revenues of the Bell system of \$270,000,000, the past year would show at 10 per cent increase an amount well in excess of \$290,000,000. For telephony as a whole, including the independent systems, a total of, say, \$425,000,000 might be set down. This may be high, but probably not far out of the way. There has been a tremendous use of the telephone throughout the year.

TELEGRAPHY KEEPS PACE WITH OTHER SERVICES

What applies to telephony as a convenience turned to necessity applies equally to telegraphy, and it is therefore not surprising that the time-honored key and sounder have quite largely come into their own again, while both cable and wireless have been worked to the limit in spite of all censorship. For the telegraph 1917 has been a year not less fat than 1916, and so long as the war goes on the prospects for an extra dividend or two each year are quite rosy. Should the last quarter of 1917 equal in gains the preceding nine months, the Western Union system will undoubtedly be able to point to the best year in its history. The gross for ten months was not less than \$63,471,538, as compared with \$50,508,030. If to the gross earnings of the two great telegraph systems, including their land and cable lines, be added the wireless proceeds and the earnings of fire-alarm, burglar, police and kindred systems, a total of \$175,000,000 seems likely.

Just what to set down for isolated plants remains as much of a problem as ever. Many such plants have been

taken over by central stations, and the argument is more than ever that way in days of fuel famine and large water-power transmission; but doubtless the service of many isolated plants has been unduly heavy, even if it does not reach \$200,000,000 all told, as estimated once in these pages. The sum of \$150,000,000 is submitted as possibly near the mark.

COSTS AFFECT MANUFACTURING TOTAL

All estimates as to electrical manufacturing partake of the nature of guesses and as compared with the data of other years are just now of a peculiarly limited value. As was pointed out last year, the enormous advances in prices for raw material have "queered" any real comparisons. It is indeed remarkable that quotations for electrical supplies and apparatus have not gone much higher in view of exaggerated production costs and the active demand. There have naturally been notable advances in many articles, but as in the case of our swollen export trade the higher prices of raw materials are a partial explanation. On the other hand, there must be some economic reduction or saving due to larger production and the adoption of methods militating more keenly against waste. The total for the year may easily be up to \$600,000,000. The latest government figures are about \$360,000,000 for 1914, before all the startling jumps in raw material, wages, etc., took place, and the average increase of 10 per cent annually of the term 1909 to 1914 would in itself bring the total up to around \$475,000,000. This, however, would not include several groups of electrical supplies in wood, glass, porcelain, etc. Hence the estimated \$600,000,000 is not out of the way. The process of calculation is somewhat complicated also by the fact that many electrical manufacturers are in the munition business. Such figures as are obtainable are impressive. Thus the General Electric Company in connection with its latest necessary financing for more plants has stated its orders for 1917 at the striking amount of \$240,000,000.

The miscellaneous group of electrical industries and utilities was placed in 1916 at \$125,000,000. No reasons exist for believing the amount to have been any smaller in 1917. Summing up, therefore, the subjoined table may be presented for what it is worth.

ELECTRICITY IN UNITED STATES, 1917

Central stations	\$550,000,000
Electric traction	890,000,000
Telephony	425,000,000
Telegraphy	175,000,000
Isolated plants	150,000,000
Electrical manufacturing	600,000,000
Miscellaneous	125,000,000
Total	\$2,825,000,000

This is \$200,000,000 more than was submitted as an estimate for 1916, or in the vicinity of a 10 per cent increase, which was estimated also as the rate of increase in all recent years, as authorized by the United States Census returns. Such a total is impressive even in these times when billions have sadly lost their significance. It is believed that there is abundant justification for assuming the individual items and the grand total to be reasonably near the reality and as affording a basis of study or prophecy as to the coming curves of 1918.

Electricity Aids Navy in the War

Motors Are Used for Ammunition Hoists, Gun Carriages and Turrets and for Coaling Ships at Sea, Making the Fighting Units Highly Effective

Electrical Interconnection to Conserve Fuel

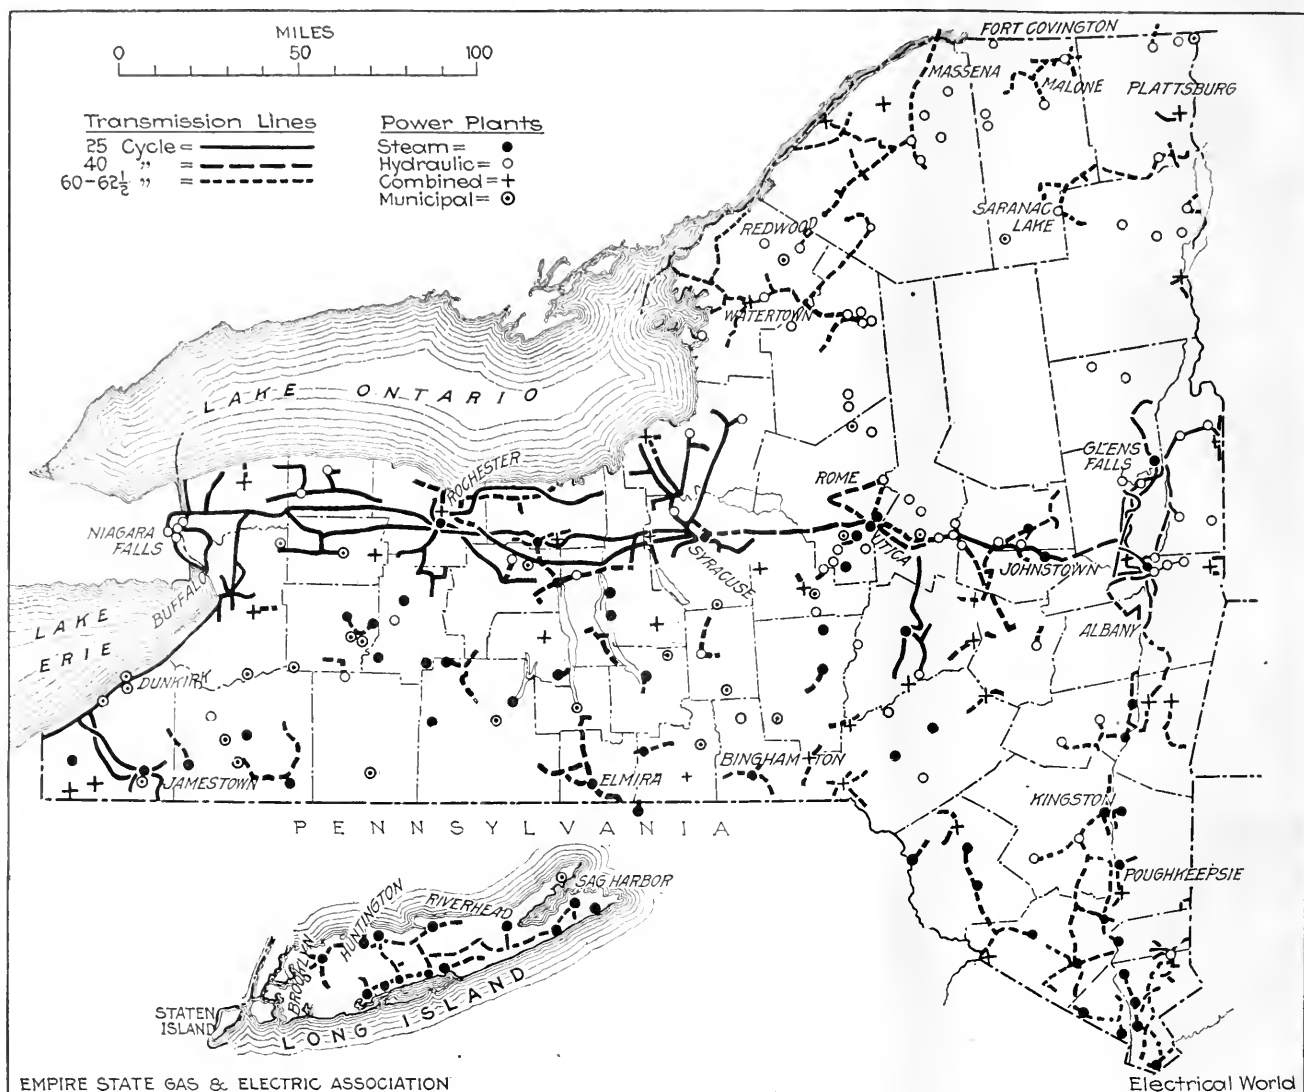

States of New York and California Present Evidence That Extensive Interconnection of Generating Systems Will Give Immediate and Practical Results in Fuel Conservation

THE opportunity for extensive interconnection of generating systems as a means of conserving power and fuel has been given particular attention in the States of New York and California. As a war measure of first importance this subject is receiving consideration from both the utilities and the state regulating commissions. Offering the advantages of

in the ELECTRICAL WORLD of Dec. 29, 1917, page 1260, presented the possibilities of the situation to the New York Public Service Commission, Second District.

A map prepared in the office of Charles H. B. Chapin, secretary of the association, is printed on this page.

The committee in its report shows that construction of transmission lines from efficient large plants to

EXISTING TRANSMISSION LINES IN NEW YORK STATE, SHOWING POSSIBILITIES OF FURTHER INTERCONNECTION

economy in fuel and generating facilities, together with better service to the public, the comprehensive arrangements which are under discussion are evidently forerunners of new policies affecting central stations.

The Empire State Gas and Electric Association, through its committee on war measures, composed of C. A. Graves, chairman, H. W. Peck and F. H. Hill, has taken steps to demonstrate the great value of such interconnection. This committee has made a report which includes a reference to the specific benefits of connecting plants. The association has also, as stated

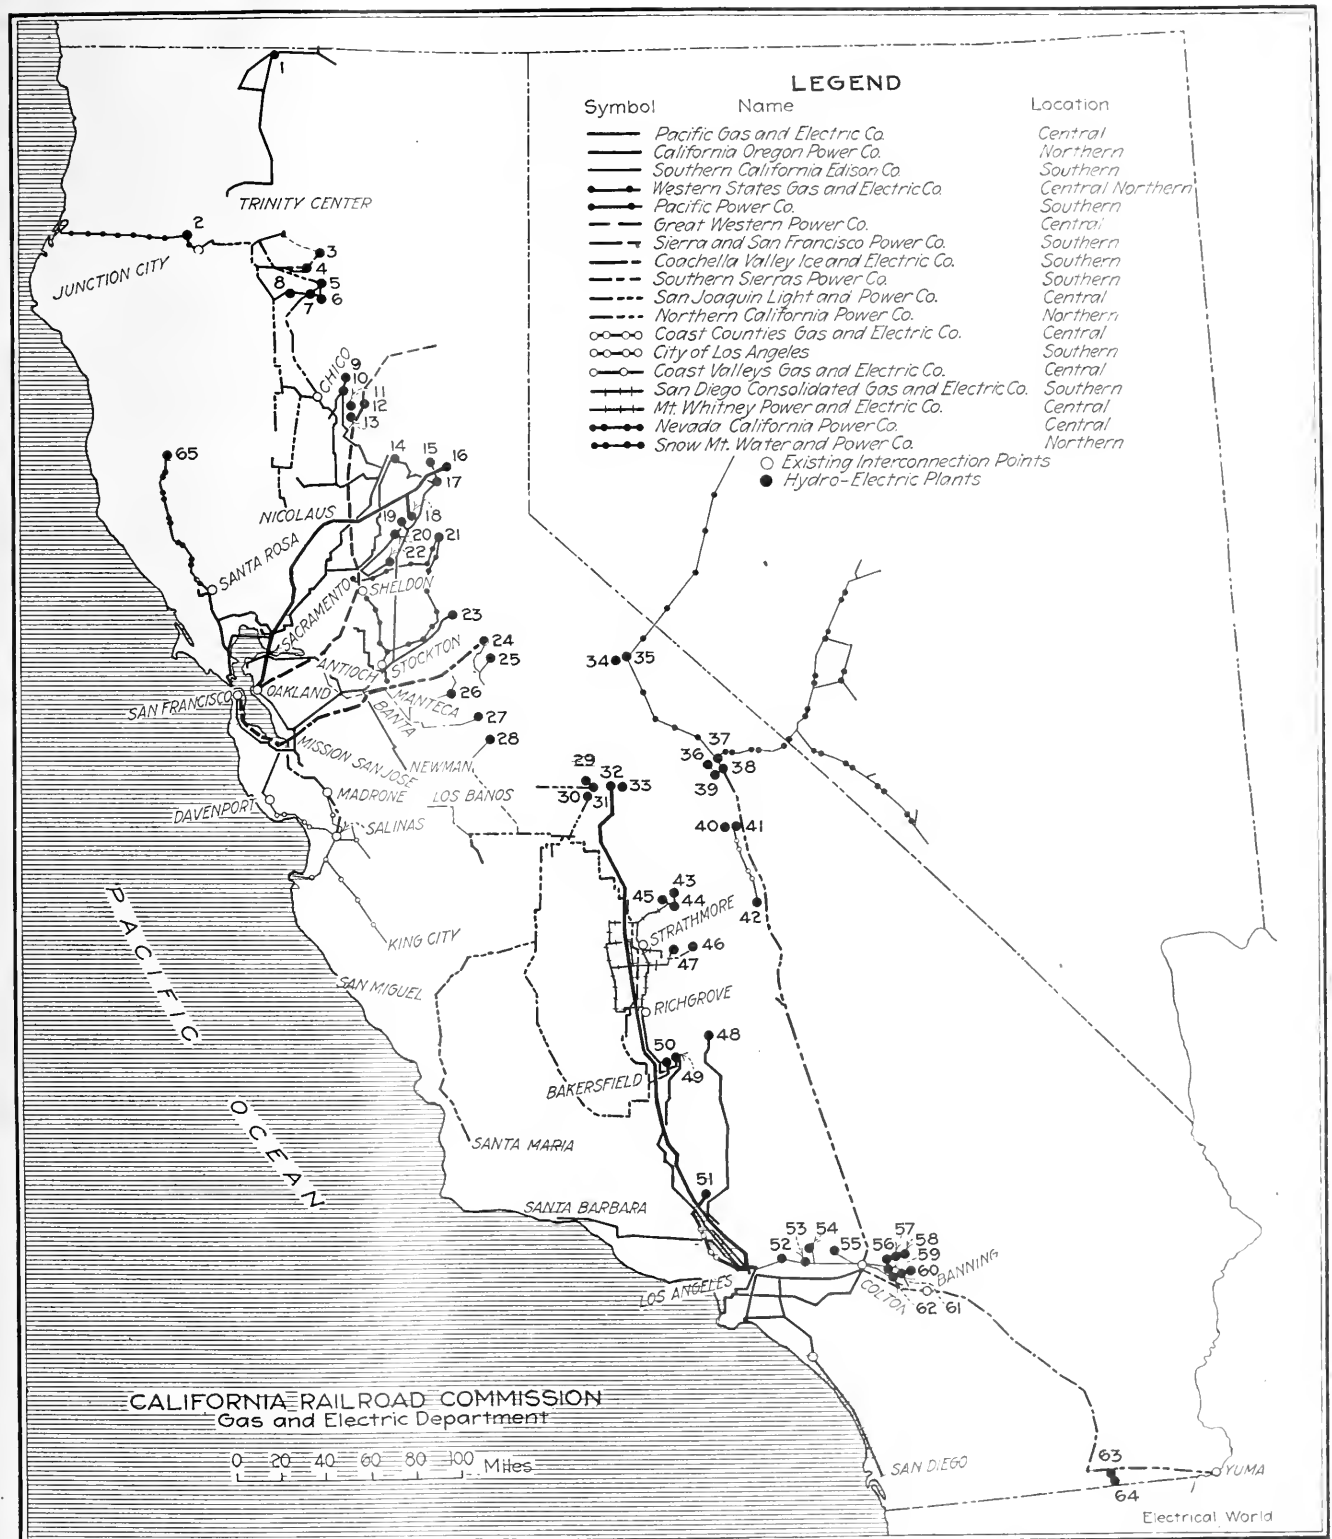

small village plants would make a material saving in coal. Transmission lines would enable many companies which are finding it difficult to obtain additional apparatus for handling increasing load to operate at full capacity because a breakdown or the withdrawal of one unit at one plant would be cared for by distribution of the load among other plants.

With its letter to the Public Service Commission, discussing ways of economizing fuel, the executive committee of the association sent a memorandum in regard to the interconnection of systems. This said in part:

It is suggested that the most immediate and practicable results that may be accomplished in fuel conservation by public utility companies on a broad scale throughout the land can be attained by use of "linking up the companies"; that is, by interconnection and the tying in by transmission tie lines, etc., of adjoining systems. This has been accomplished on a considerable scale under war-time pressure in Great Britain and has also been developed to a considerable scale in the United States under the economic pressure above referred to. In different parts of the country large systems have been developed from huge central production sources, enabling mass production under the most economical con-

ditions, this consolidation of production enabling the smaller and less efficient plants to be shut down wholly or during part of the time. These large central production sources have enabled them to deliver energy to the smaller and less efficient plants under conditions which have largely displaced their own power generation.

This general scheme of linking up accomplishes many purposes in economical power production, making it possible for the centralized plant to avail itself of the diversity factor that exists among a number of smaller and differently situated units. It enables the smaller units to be shut down during the whole summer season when the central

THE INTERCONNECTED TRANSMISSION SYSTEMS OF CALIFORNIA WHICH IT IS NOW PROPOSED TO WELD INTO ONE COMPLETE NETWORK COVERING THE ENTIRE STATE AND REACHING EVERY IMPORTANT CITY

generating plant has a considerable margin of capacity, and even during so-called peak periods it enables the smaller and less efficient plants to confine their operations to the peak hours, when it is necessary to have their installed capacity as a contribution to the total power necessary to handle the load of the consolidated system. Such linking up can often be accomplished by short tie connection or, where necessary, by transmission lines with reasonable expedition and with no great cost.

It is quite practicable to secure immediate results in many cases and enable fuel to be conserved, and such expenditures as may be involved become a permanent investment contributory to the permanent economic advantage that will be derived therefrom to the public as well as to the utilities interested. It is believed that such interconnection of utilities is of more immediate and practical advantage in fuel conservation than any attempt to secure greater operating efficiency in the individual plants.

The Railroad Commission of California has been conducting a detailed study of the benefits that could be gained by certain interconnections of the primary transmission lines of the State. The investigations, under the immediate direction of F. Emerson Hoar, have been planned so as to show, among other things, just how much fuel oil could be saved in stand-by plants, how the combined load factor of the companies involved could be improved by certain tie-ins and how these tie-ins could be best accomplished. The results of this study have not yet been made public, but the map which was prepared at considerable expense to facilitate the work has been released and a special tracing made therefrom for use in the *ELECTRICAL WORLD* is reproduced on page 13.

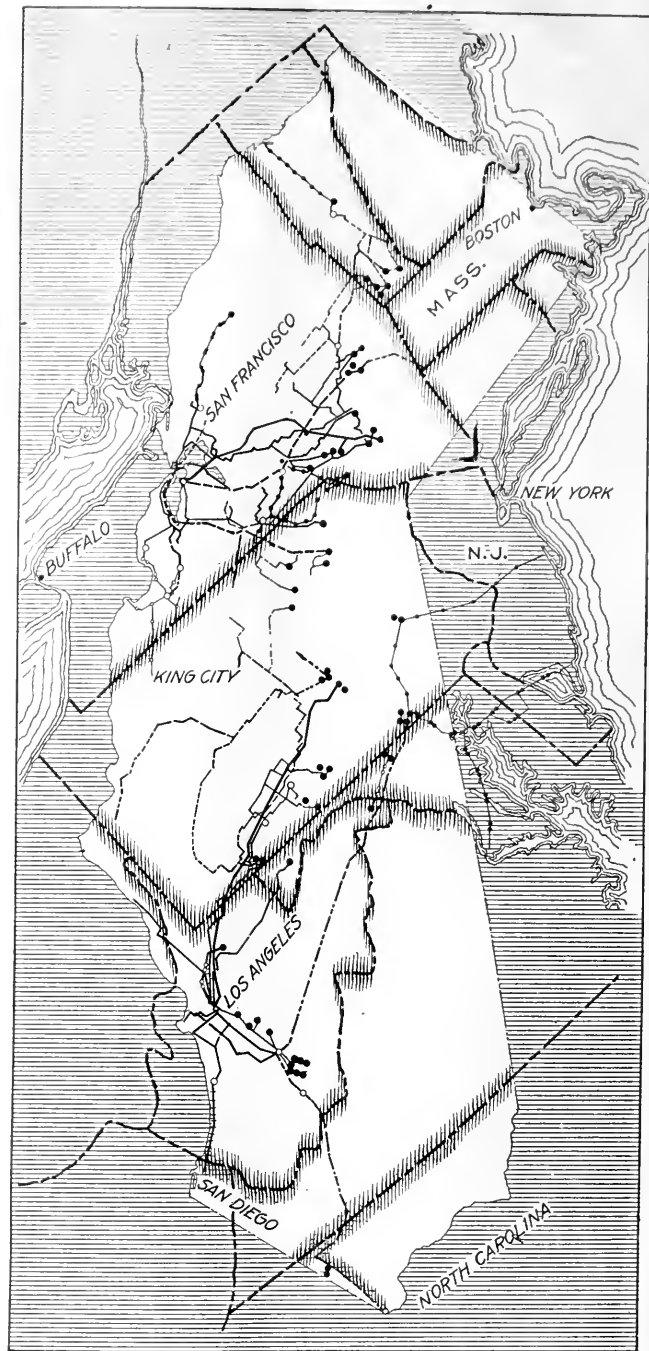

The systems shown on the map last year handled 437,730 kw. developed by hydroelectric energy and 323,317 kw. developed by steam, a total of 761,047 kw. The interconnections now in use or under construction on Jan. 1 are shown in the map by circles. Attention is directed toward six interesting connection possibilities, as follows:

1. A 16-mile (25.7-km.) line from Kennett, on the Northern California Power Company's system, to tie in with the California Oregon Power Company's line at Minorsville.
2. An interconnection at Nicolaus between intersecting lines of the Pacific Gas & Electric Company and the Great Western Power Company.
3. A 15-mile (24.1-km.) line from Manteca, on the Sierra & San Francisco Power Company's system, to a junction with the Pacific Gas & Electric Company's line at Stockton.
4. A 35-mile (56.3-km.) line from King City, on the Coast Valleys Gas & Electric Company's system, to the San Joaquin Light & Power Corporation's line at San Miguel.
5. A 50-mile (80.4-km.) line from Santa Maria, on the San Joaquin Light & Power Corporation's system, to Santa Barbara, on the Southern California Edison Company's system.
6. A trunk-line connection between the central California group of lines that center around the San Francisco Bay region and the Southern California group, which could be reached near Fresno. This latter connection would require a link about 150 miles (241 km.) long, and while it will be a very desirable connection ultimately, it is not receiving serious consideration at present.

It is interesting to note that about 75 per cent of the energy generated for the central group of systems is utilized within 25 miles (40 km.) of San Francisco. The highest transmission voltage in California is the 150,000-volt, 240-mile (386.2-km.) line from Big Creek to Los Angeles.

All of the important lines in the State are operated at a frequency of 60 cycles except those of the South-

ern California Edison Company and the city of Los Angeles system. Frequency changers are being put in where the Southern California Edison line ties in with the San Diego Consolidated Gas & Electric. The Southern Sierras system, it will be noted, has a continuous series of lines of 17,000 volts or more extending for a distance of 450 miles (724.2 km.) north and

THE INTERCONNECTED TRANSMISSION LINES OF CALIFORNIA WOULD STRETCH FROM MAINE TO NORTH CAROLINA, COVERING ELEVEN ATLANTIC STATES

south. Voltages lower than 17,000 are used on some of this company's lines in the southern part of its territory, and if these were taken into account the total distance of transmission would be much greater. In fact, energy generated in a latitude north of San Francisco on this system is delivered wholesale at the Mexican border for still further transmission to consumers south of that line.

Pacific Coast Companies Meet War Problems

Experiences of the California Utilities Under Present Critical Conditions Direct Forceful Attention to Necessity for Full Utilization of Water Power

BY JOHN A. BRITTON

Vice-President and General Manager Pacific Gas & Electric Company, San Francisco

THE situation on the Pacific Coast presents unusual conditions regarding the fuel necessary for the generation of power either for transportation or direct power purposes in that, with the exception of a few coal fields on the northern part of the coast between Oregon and Washington in the Puget Sound country, this section is dependent entirely upon oil.

The withdrawal of large portions of government lands from production a few years ago and the increased demand for oil for industrial and transportation uses have made the Pacific Coast feel more than any other section of the country its situation of dependence on this fuel. While it has developed a greater proportion of hydroelectric power than any other section of the country, due primarily to the very cheap power sold by the developing companies, it has not been able in its development to keep pace with the demands, and the power companies have been driven of late to a very much greater use of steam by means of fuel oil for the generation of energy to fill in the gap between demand and their full quota of hydroelectric power.

The initial hydroelectric plants on the coast were not built with the view of conserving the water, very few of them being provided with sufficient storage capacity. This is because the rivers in California offered in normal flow sufficient power at the time of first development. We are now beginning to feel the stress in the southern part of the Pacific Coast States of the dry season, which accounts for the large proportion of steam power now being used. Whereas in southern California in normal years but 8 per cent of the total output of electric energy was generated by means of steam plants, during the low-water period this year this generation has exceeded 30 per cent.

Fuel oil has increased abnormally in price. From the prevailing rate less than two years ago of 60 cents per

barrel for fuel oil in San Francisco the cost has increased to \$1.35 per barrel, and very little, if any, can be bought even at the now quoted figure of \$1.55 per barrel. Storage of oil is decreasing monthly to the extent of about 1,000,000 barrels, and with no more than 14,000,000 barrels in storage available for fuel purposes it can be seen readily that the situation on the Pacific

IRRIGATION, BRINGING FOOD TO WIN THE WAR, IS A GREAT PART OF THE CALIFORNIA LOAD

Coast is serious and demands on its face the further development of hydroelectric power.

So long as the government of the United States resorts to the method it has pursued in the past of placing such restrictive conditions upon occupancy of government lands, hydroelectric power cannot and will not be developed in California. Instead of imposing restrictions and conditions upon such development, the government should offer a bonus on the capital that is willing to make the investment, because of the greater aid and benefit that that capital will be to the resources

not only of this State but indirectly of the entire United States. Revocable licenses and the imposition of high charges for the use of a limited quantity of government land, on which most of the hydroelectric power companies are located, do not make for stability of capital investment, but practically render it impossible to obtain capital.

As all of the industries in California and all of the utilities and plants are built for the utilization of oil, it would be an almost impossible task to turn to any other fuel; in fact, no other fuel is available at present. Coal is not obtained in sufficient quantities on the coast to take the place of oil, and in these present times and for some time to come transportation of coal either by ships from Alaska and Australia or by rail from Oregon, Washington, Vancouver, or even the Colorado and Wyoming coal fields, is not to be conceived of. There is no electric plant on the coast that can be equipped to burn coal properly within at least three months. The diminution of our oil supply would, therefore, in view of these conditions, practically paralyze every industry on the coast.

I know of no stronger argument in favor of further hydroelectric development than the conservation of the natural resources which are exhaustible against other resources which are practically inexhaustible.

There is one particular satisfaction among the power men of the Pacific Coast, and that is that by reason of their ability in the earlier stages of hydroelectric development to sell power cheaply and by reason of the very low price at which fuel oil was sold, they were able to discourage the isolated power plant, which does not exist to any degree in California.

It is obvious that with the higher costs of operation due to increased cost and scarcity of labor and increased cost and scarcity of materials, higher rates must prevail than have prevailed heretofore. It seems an unfair proposition that producers of commodities, enabled by the exigencies of the situation to obtain more than ordinary profits, should be permitted to do so and let

the utilities of the country bear the burden alone. Not only should utilities have better rates and a better return upon their uncertain investment, but they should be financed by consumers desiring long extensions and should have the aid of the Federal Reserve banks of this country in discounting utility paper.

Regulation by commission must be ineffective unless the commissions realize the necessity at times like these of proper protection of the investments committed to

TRANSMISSION LINES COVER GREAT AREAS

their charge. I am sure that the California commission fully realizes this situation and will give relief at the proper time and in the proper place.

The outlook for the future prosperity of this State never was better. The war necessities have provoked a condition of economy so far as it is within the power of the times to create it, and utilization of products long since neglected and the development of industries heretofore unknown are bound to be constant factors even after the war has ceased, and personally I look for a period in the years to come of the greatest prosperity the coast has ever experienced.

War-Time Value of Hydroelectric Power

BY HENRY I. HARRIMAN

President New England Power Company and President Boston Chamber of Commerce

FOR more than a quarter of a century the engineers have recognized the value of hydroelectric power and have devoted the highest professional ability to its development. Banking and industrial interests have contributed funds and markets for this development; and public utilities, at first sometimes unaware of its economic importance, have entered into co-operative arrangements for the purchase and interchange of energy with large-scale producers and distributors of water power. The foundation for future development has been firmly established.

The present shortage of coal accentuates the value of hydroelectric power service in a most striking way. Vast resources remain undeveloped along the streams of our country, and it is unfortunate that under present war conditions the cost of utilizing waterfalls now running to waste is so great in many instances as to retard capital from service in this vitally important field. The passage of the Shields bill by the Senate is most encouraging, despite the fact that the bill is not wholly satisfactory from the standpoint of the power producer; and it is to be hoped that this bill, or one closely resembling it, will be passed by the House and receive the signature of the President soon. If this is done, the development of much needed power from navigable streams in particular will be facilitated.

Concretely, water power is mitigating hardships of the present fuel situation to an extent that probably is little realized. With a 50 per cent load factor, every kilowatt of installed capacity in a hydroelectric station saves the equivalent of about 5 tons of coal per year, allowing from 2 lb. to 2.5 lb. of coal per kilowatt-hour. The present rate of output of the New England Power Company's water-driven generators is saving central New England 300,000 tons of bituminous coal per annum. From two-thirds to three-fourths of the output of this system is now derived from waterfall. The market is practically sold out for hydroelectric energy in this territory.

While a curtailment of service averaging about one-sixth has been forced upon our industrial power customers by the shortage of coal in auxiliary plants, there is no question that these customers have suffered much less in this way than would have been the case had they been dependent upon their own fuel supplies. In general the curtailment of service has been received patriotically by customers.

During the year just closed it has been impossible to create the usual reserve stocks of coal in New England, and this section of the country received only about 80 per cent of its normal bituminous coal shipments. A heavy demand for power resulted from increased industrial activity due to the war. Users of hydroelectric service have been able to obtain it with regularity and on the basis of contracts placed when the price of coal ranged from \$4.50 to \$5 per ton. This has enabled power purchasers to take long views ahead

in planning factory operations and expansion programs. The stability of water power when developed, barring the fluctuations of flowage in different streams, is a real asset, not only to a company producing and transmitting such energy for distribution, but to industrial organizations controlling such power within their own premises or at sites owned by them distant from their establishments. Complete exhaustion of water power in a system developed along modern engineering lines, with due regard for storage and for close control of outputs at different stations in a transmission network, is most unlikely.

The steam plant, on the other hand, is threatened by a complete tie-up if an adequate supply of fuel cannot be obtained. Three of the larger central stations operating in the New England Power Company's territory at present have only sufficient coal to carry them seventeen days; and by contrast it should be noted that no properly engineered large water-power system is likely to be completely down and out even under the most unfavorable conditions. There is good reason to expect more favorable water conditions before the winter ends; a week or two of mild weather will increase the run-off on the snow-covered and frozen watersheds of the upper Deerfield and Connecticut valleys to an extent that will be very helpful in the existing fuel scarcity, and vigorous efforts are being made to complete the installation of a 45,000-kw. turbo-generator at Providence, R. I., where steam power can be purchased to supplement the requirements of the transmission system of the New England company.

I have been asked whether it would be advisable for the federal government to undertake to finance water-power development in New England, at present deferred by high cost of money, labor and materials. Such a policy would certainly have endless ramifications; it would lead to many varied and scattered demands upon the public treasury from different sources interested in power production from streams, and the heavy calls upon the country for money with which to finance war needs must be met before funds can be spared for developments of the kind referred to.

The question is also affected by the uncertainty of duration of the war. Under favorable circumstances a hydroelectric development of magnitude requires about two years for completion, and in the light of present conditions the situation as regards power demand should be met by private capital rather than by public funds. Certainly until more evidence is forthcoming of the inability of privately owned utilities to solve the problems associated with the production, transmission and distribution of electrical energy for service under war conditions, I should be disinclined to favor governmental entry into this field, the hands of the public authorities being already fully occupied with the huge tasks of war on a scale unprecedented in the history of our country.

Engineering Societies' War Activities

A Survey and Analysis of the More Important Ways in Which National Technical Bodies Have Aided the Government

IN THE year just closed, almost nine months ago to the day, the United States, through President Wilson, formally declared itself at war with Germany. American citizens were prompt to offer their services to the nation, and in this eagerness to serve none were more quick or more prepared than the engineers of the United States.

Anticipating the possibility that this country might find it necessary to answer the insolence of the imperial German government with the sword, the engineering citizenship of the nation, through the national engineering societies, early in 1915, when the conflict in Europe was but a little more than half a year old, started on a concrete program of preparedness.

Since that time the nation's engineering talent through its national association affiliations has tremendously increased its government war-aid activities until at one time not many months ago it seemed for the moment to be defeating its very aims because too many activities often seriously overlapped and frequently conflicted. This crisis, however, is now believed to have passed, and the opinion seems to prevail that through the formation of the Engineering Council harmony of accomplishment will be completely restored and that co-ordinated effort will result.

It is therefore with a view toward showing broadly how those national engineering bodies with which the **ELECTRICAL WORLD** is more intimately connected have endeavored to serve the government that this analysis of the war activities by engineering societies has been undertaken.

FIRST STEP THREE YEARS AGO

The first step was made early in 1915, about two years before the United States actually became a participant in the war, in the formation of a joint committee of representatives from each of the national societies of electrical, mechanical, mining, civil and consulting engineers to co-operate with the War Department in the organization of a National Engineer Reserve. The direct result of this committee's work was the provision by Congress for an Engineer Officers' Reserve Corps, now in full operation, evidences of which are apparent in the great number of commissioned engineers. A tabulation of these in the higher ranks will be found elsewhere in this issue.

In the formation of this reserve the societies were of no small value. The American Institute of Electrical Engineers early sent out a brief military data sheet to its membership. More than 2000 of these filled-out sheets were forwarded to the Institute's representative at Washington, who was chairman of the Institute's committee on national defense, and were turned over by him to the various departments of the army and navy. From these sheets men were selected for their qualifications, and to them were sent application forms for admission to the Reserve Corps.

Besides, in order that the engineers might know exactly what were the requirements for the reserve, the

five societies above mentioned distributed prior to the entrance of the United States into the war two pamphlets, one for the army, the other for the navy. These pamphlets were both based on government reports and orders. In this and many other ways the engineering bodies of the country have been particularly active in giving the widest publicity of the most helpful nature to the nation's requirements and needs in engineering details and personnel.

SECRETARY DANIELS' INVITATION

Following the steps taken to give the engineer a recognized place in national service, as above explained, came the invitation on July 19, 1915, from Secretary of the Navy Daniels to the engineering societies to select each two members for appointment by the Secretary of the Navy to act with Thomas A. Edison as chairman on an advisory committee to assist the Navy Department both instructively and critically in the development of new ideas for naval advance, thereby making available to the navy the best fruits of American inventiveness. Such was the formation of the Naval Consulting Board, the value of which needs here no further exposition.

The usefulness of this board has been greatly increased since its formation through the collection of data on the nation's manufacturing resources. To accomplish this work the engineering societies were again called upon, this time by President Wilson, each to nominate a representative in each state of the Union to act in conjunction with representatives of the other associations to assist in this work of industrial preparedness. A plan for a census and classification of manufacturing industry was put into effect, and by the time the United States had entered the war returns had been received from 27,000 of the larger plants.

The War Committee of Technical Societies, the formation of which was initiated by the Engineering Council, and which is acting in close co-operation with the Naval Consulting Board, has been doing a very valuable work. This committee is composed of two members from each of the national societies of civil, electrical, mechanical, mining, gas, electrochemical, illuminating, mining and metallurgical and refrigerating engineers. At the request of the **ELECTRICAL WORLD**, David W. Brunton, chairman of this committee, has prepared the following statement of the committee's aims and functions:

The general attitude of the government of the United States toward inventors is that it is anxious to receive and consider any new inventions relating to war equipment and operations. To some extent there have been actual invitations to undertake such work.

The technically trained men of the country, who are peculiarly fitted to undertake creative work, appear to be taking but little part in volunteer war invention. This is probably due to the fact that it is not the habit of such men to undertake inventive work until they know what is wanted and have the necessary information for it. With the exception of those technical men who have been able to enter the army and navy and a small percentage actually at work in the va-

rious boards, councils, committees, bureaus, etc., the technical men of the country are merely filling their usual positions in its industrial system. They are, however, in a state of increasing dissatisfaction with this situation. That in a war of science and machinery more than 100,000 trained men, eager and patriotic, should have no direct means of applying their specialized abilities as engineers, electricians and chemists in aid of the nation seems intolerable to them.

To meet this situation the War Committee of Technical Societies was organized. Its purpose is to bring war work to these 100,000 men at their own homes. It will, from every available source, collect those war problems of research and invention which will be useful and valuable to the government, formulate them properly with the aid of specialists, and distribute them to all the membership of the societies accompanied by the data desired so far as this is practicable.

In delivering the results of this organized general work to the government, it is planned to turn over each class of results to the particular agency which now handles that class for the government, such as the Naval Consulting Board, the National Research Council, the Aircraft Production Board, the Council of National Defense, etc. It is the intention to assist and support and strengthen in every way possible each of these existing agencies, and to distribute for them all problems which they desire to have presented to the general membership of the societies.

Recognizing the need for co-ordinating the resources and industries of the country, Congress on Aug. 29, 1916, authorized the formation of the Council of National Defense, which has since played a leading part in the government's war program. To assist the council in a consulting capacity, without pay, an advisory commission was authorized. A number of the national engineering societies were consequently invited to appoint representatives on the committee on science and research of the advisory commission to which the supervision of engineering matters had been assigned.

The following month, at the request of President Wilson, there was created by the National Academy of Sciences, the National Research Council to co-ordinate existing scientific and research organizations and to encourage research in industry and war, to the end that the nation might be strengthened. The work of the Research Council is being carried on through the agency of central committees, including one on engineering. To this committee the national engineering associations were invited to appoint two members each to constitute with the engineer members of the Council the engineering committee. The Research Council through its various committees has been of unusual service to the government. Its members have been able to solve many problems for the different divisions of the army and navy, besides aiding in many instances American industry to turn out new products.

As strictly society functions, however, where the different bodies were working on their own initiative, the classification and cross-indexing of the membership of these societies is perhaps the most noteworthy. Each member has been mailed a questionnaire which, with the necessary exception of "experience" details, is virtually uniform for several of the societies. Some of the societies are doing this work alone, but a number have placed the indexing in the hands of the American Society of Mechanical Engineers, on whose original questionnaire the present general engineering questionnaire was based, each society, of course, paying the expense involved in its work.

Besides giving the customary personal data, the applicant can by a system of easily understood symbols specify exactly what his experience has been and what

are his specialties. By means of a carefully designed system all of these answers are now being cross-indexed, so that at any time the government or industry should need a man or men with certain definite engineering qualifications the engineering societies will be in a position quickly to furnish a list of those best qualified. By this means the government and industry will have for the first time at its command information on specially qualified engineers. In many other ways, seemingly more concrete and apparent, have the engineering societies been able to serve the government.

ACTIVITIES OF THE A. I. E. E.

The American Institute of Electrical Engineers, for instance, has assisted the government in obtaining the services of technical men for the following branches of service: By request of the Bureau of Navigation the Institute nominated eighty five graduate electrical engineers for appointment as lieutenants, junior grade, United States Naval Reserve Force; Bureau of Yards and Docks, candidates for appointment in the Civil Engineer Corps of the United States Naval Reserve Force, for the ranks of ensign, lieutenant, junior grade, and lieutenant; Bureau of Chemistry, electrical and mechanical engineers for special investigations throughout the country; Signal Corps, electrical men for the radio division and the aviation section; Bureau of Navigation, candidates for aviation inspection duty for training as ensigns in the Naval Reserve Flying Corps; Coast Artillery School, department of enlisted specialists, draftsmen, engineers, electricians and radio operators, as temporary non-commissioned officers, and in many other ways.

The American Society of Mechanical Engineers has done similar service in furnishing men in lots from one to a hundred or so for government and civilian service. It has assisted materially in the fuel administration through co-operation with the officers of the Bureau of Mines.

The Illuminating Engineering Society has had a similar experience and through its committee on war service has been able to be of considerable very evident service to the government in the design of lighting for buildings and grounds of aviation camps and for night flying, and also in the design of lighting for other buildings being erected by the Navy Department and the Department of War. This society at the request of Samuel Gompers nominated two members to serve with the committee of labor of the Council of National Defense to take up the question of factory, mill and workshop lighting, (1) to conserve eyesight of workmen, (2) to make factories safe by proper lighting, (3) by giving proper lighting to increase efficiency of workmen, and (4) to increase output and decrease spoilage. A code on lighting was prepared by the members designated by the society and accepted by the government. It has not yet been distributed, owing to the pressure of other work. Five states already have taken up the rules of the code and have either put them into practice or are under way to do so.

These results are by no means all that the engineering societies have accomplished, but they serve to show the effectiveness of such bodies and the valuable assistance that they can render to the government. Just at present plans are being perfected toward co-ordinating these activities under the Engineering Council which

was formed as the outgrowth of a real need for proper consideration of questions of general interest to engineers and to the public, and to provide the means for united action upon questions of common concern. At present the council is concerned only with the electrical, mechanical, civil and mining engineering national societies, but provision has been made for the election to membership of other national engineering and technical societies.

An insight into the co-ordinative principle of the council is gained from a paragraph or two from a recent announcement by the council:

Certain questions relate to the war and the assistance that engineers can render. A committee, to be called the American Engineering Service Committee, was appointed with instructions to invite the co-operation of all engineering societies in tabulating and listing the members of the five societies represented, in order that we as a profession may be in a position to take a larger part in the industries after peace is declared. This tabulation has already in part been done, but in a rather unsystematic and unequal way. It is hoped that the new committee by having additions from other societies may make a final and lasting tabulation of all the engineers in the United States. The list is to be kept in

the Engineering Societies Building for use in government problems and in the industries. At present the committee is devoting its attention to the immediate need of the hour, namely, the procurement of men for special service in the government. A list of specialists in the societies has already been completed.

Another committee, of which David W. Brunton is chairman, is called the War Committee of Technical Societies. The members are Messrs. A. M. Greene, R. N. Inglis, C. R. Corning, G. C. Stone, D. W. Brunton, J. M. Boyle, J. V. Davies, Joseph Bijur, A. S. McAllister, W. D. Richardson and Charles Baskerville. It was appointed to assist any organization in Washington, such as, for instance, the Council of National Defense, the National Research Council and the Naval Consulting Board, in any way in which it can bring to the attention of the engineers of the country the necessity for thought and help in the numerous national problems that arise.

That the engineering bodies of the country have been performing a distinctly valuable war service to the nation is recognized by President Wilson and by the war administration of the government. That these bodies through co-operative and co-ordinated efforts will be an ever-increasing factor in the successful waging of the war is unquestioned.

American Engineers in Service

List of More than Three Hundred Electrical and Mechanical Engineers with Commissions of Captain or Higher

ENGINEERS were quick to place themselves in the active service of the country when war broke out. Already many thousands of them are serving in one capacity or another. To list all of these would be too great a task. As indicative, however, of the extent to which the profession is represented there

follows a list of 336 engineers who have received the commission of captain or a higher rank in the army or the navy. These names were taken from the lists of the American Institute of Electrical Engineers and also from those of the American Society of Mechanical Engineers.

Utilities Turn to Regulatory Commissions

Success with Which Privately Owned Properties Emerge from Growing Economic Pressure Depends Largely on Judicial Spirit and Breadth of Vision of Those Intrusted with State Regulative Powers

BY WILLIAM J. HAGENAH

Of Hagenah & Erickson

THE year 1917 has witnessed the beginning of what promises to be the most critical period through which privately owned utilities have passed. The forces which have contributed to this condition are not new, although the great war in which we are now engaged has given them impetus and added significance, both because of the acute conditions resulting from our direct participation in the war and because of the economic and social readjustments which will doubtless follow it. The measure of success with which these properties emerge from the growing economic pressure depends largely on the judicial spirit and breadth of vision of those intrusted with the administration of our present machinery of regulation. The guidance and protection of this industry, if the present form of regulation is to succeed, call for sound reasoning and a firm adherence to fundamental economics. Such action as has been taken with respect to these conditions in 1917 gives a favorable promise, but the real test will come in 1918 and probably during two or three years thereafter.

For over twenty years officers and owners of public utility properties, both municipal and private, have beheld with serious misgivings the steady increase in commodity prices and the corresponding decline in the purchasing power of the dollar. During the greater part of this time they have had two methods of protection—reduction of operating expenses through increased efficiencies, and increases in rates. By reason of the larger and more efficient apparatus, costs have now been reduced as far as our present knowledge will permit, and it will require a discovery of radical and far-reaching consequences to give promise of further decreases. Increases in rates by the utilities, a course still open to commercial and industrial establishments through price advances, have been checked by regulatory legislation. At present, therefore, when confronted by tremendously increased operating expenses and emergency regulation designed to reduce the service output, and by legal restrictions preventing an increase in rates, utilities behold net earnings declining to the vanishing point and turn to the regulatory commissions as their only avenue for early relief.

THE REAL TEST OF REGULATION

Five years ago in a similar article the economic movement which gave rise to public service commissions was described as consisting of three stages—first, the period of public protest against the early conditions of unrestricted utility operations; second, the period of legislation during which regulatory statutes were enacted and their administrative machinery developed, and, third, the period during which the industry has been seeking to adapt itself to the new legislation. We are at the present time still in the third stage, with the question as to whether the present

machinery for regulating utilities is successful as yet not definitely answered. Regulation prior to 1917 has had to deal mostly with the adequacy of service and with such periodical reductions in rates as were found justified by the economies and profits resulting from operating efficiency and from the business development incident to the growth of the industry in the community served. Students of the price movement, however, have been calling attention for a number of years to the conditions which were operating greatly to reduce the net earnings and foreshowing their ultimate extinction unless greater attention were paid to the steady rise in prices with its effect on earnings and on the cost of securing new capital.

THE BREAKING OF THE STORM

The storm which for years has been gathering with increasing darkness on the utility and railroad horizon has now broken in all its fury under the strain of war, and with it has come the real test of the present method of regulation. We have entered a period of great economic stress and the end is not in sight. Prices have scored greater advances during the last eighteen months than during the twenty years preceding, which years represented a period of almost uninterrupted advancing prices. The cost of coal, copper, steel, chemicals and other supplies has doubled and in some instances trebled. Wages have been advanced more rapidly than at any other period in the history of the country and yet have hardly kept pace with prices. The demands of labor are constantly increasing, but its efficiency in most instances is decreasing. New forms of taxation have been devised, while the old forms, already burdensome, are being greatly increased. While the industrial power of the country has been developed to a degree previously thought impossible, and under such conditions profits in many lines have temporarily risen, securities of all kinds have experienced the greatest decline in almost a generation. In the midst of these conditions the purchasing power of the fixed unit of income has sunk to its lowest level and the cost of capital has correspondingly advanced. The financing of even normal requirements is practically impossible now and will be extremely difficult at anything less than prohibitive rates for a number of years to come.

The present utility problem, however, is not alone one of increasing commodity prices and costs of capital. Active measures are now also being taken to restrict operations which directly curtail gross earnings. Plant extensions not required directly or indirectly for national purposes are discouraged. Sign lighting and boulevard illumination are restricted. Even in the lighting of homes and offices it is urged that the greatest economy be pursued, and to encourage further the saving of energy it is suggested that clocks be advanced one hour. To the extent that the capacity thus released

may be devoted to power purposes in industries made necessary by the war no present loss may be sustained, but normal conditions in this respect will not promptly be restored by the discontinuance of war contracts.

These are some of the problems which confront the utilities and commissions, but they are not all. The recent abrupt decline in net revenue and the increasing cost of capital are the immediate effects of our present war pressure and are therefore to some extent temporary. There are, however, indications that the disturbed conditions in the utility field this year are due as much to the fear of the conditions which are to follow the war as to the war itself. War is the greatest leveler. Already the structure of supply and demand has practically collapsed. The government has established maximum prices for wheat, steel, copper, coal and other commodities and has accomplished what competition at this time could not do. It is taking over the management of the railroads and other carriers. It will purchase equipment for their use, direct joint use of facilities wherever necessary, and order extensions where most needed for the greatest public good.

Just as it controls the price for the transportation and fixes in addition the price for the supplies that enter into it, so it can and probably will fix the salaries and wages of its employees. If, when the necessity requires, it sees fit to take over the transportation system, it may also take over the utilities, operating them for the general public good, fixing not only their rates but the cost of their supplies and their labor, and if such course is successful as a war measure, the public may come to believe that the same arrangement would be equally desirable for the days of peace.

CONSTRUCTIVE SPIRIT OF THE COMMISSIONS

In the face of these conditions it is encouraging to note the broad constructive spirit with which many of the public utility commissions have approached these problems. Prior to 1917 regulation of rates generally meant regulation downward. The overwhelming majority of cases resulted in reductions in rates, the important instances where increases were granted being so few as to incite each time wide public mention. During 1917 public service commissions have given unusual consideration to price movements and their effect on the public utilities, and as a result many commissions have recently readjusted rates on the basis of the new conditions. In this connection it is worthy of mention that the public criticism which it was always expected would arise in great volume should the commissions grant frequent increases has in practically every instance failed to appear, showing at once a general public understanding of the unfavorable conditions which have been surrounding public utilities and a degree of confidence in the decisions of the commissions that augurs well for the future. If regulation in its present form is to be permanent, it must be realized that the rates which may be reduced when profits are large must be increased when economic conditions endanger a fair return on the investment. The greatest stumbling block to all regulation will be definitely removed when once the public understands that, like the man who may lead a horse to water but cannot make him drink, it may take great liberties with the investment which the utility has already made but no amount of legislation, either that already on the statute books or that which

is constitutionally possible, can compel a dissatisfied investor to supply additional capital.

An analysis of the decisions made in the year just closed shows that the commissions have allowed numerous increases in rates and in some cases have modified standards to the end that operating expenses might be reduced. In over twenty-three different states have increased electric light and power rates been made effective, and increased traction and interurban fares have also frequently been allowed. The increased revenues thus made available have been substantial and often cover a large part, if not all, of the increased costs which had been encountered up to the time when the applications were made. In some states the increases were allowed after exhaustive investigations, but in most cases they became effective by the mere filing of the amended schedules and the absence of protests during the period prescribed by statute. In each case, whether actively or passively favorable to the increases, the commissions have shown a growing appreciation of the problems confronting the utility managements. As offsetting these increases, there have been a few instances of rate reductions, and further reductions will doubtless be made even during the period of the war, for there are still instances where rates covering specific classes of service are apparently too high or where by means of the camouflage of involved schedule forms the entire schedule is being maintained on what appears to be an unreasonable basis.

That the utility commissions should have responded so promptly to the necessities of the case gives promise of the ultimate success of state regulation, unless the social problems growing out of the war should lead to a period of prolonged radical legislation aimed at all corporations but especially at public service corporations. In this year of crises the utilities subject to state regulation have fared far better than corporations dependent on assistance from national bodies or those subject to regulation by municipalities. Additional legislation is still desirable and conditions are rapidly making this urgent. A more general control of the issuance of securities is needed for the protection of both the public and the utility, for the rights of capital are best safeguarded where the commissions are charged with a degree of responsibility over it. Likewise, it may be found both advisable and necessary to legislate with respect to labor, either by adjusting its wages definitely on a basis which varies with the profits of the utilities or by making labor share directly with capital the responsibility for the utilities' success.

Most of the utilities have experienced substantially reduced net earnings, but this is not a time when reductions in earnings traceable to temporary conditions should cause grave concern. When thousands of men are dying in battle and billions of national wealth are being spent for the protection of human rights, utilities, like individuals, must take their place in the ranks and contribute with all for the greatest public good. But it is of the utmost importance at such a time that the fundamental rights of property shall be sustained, that there shall be preserved to the owners the true value of their investment, and that in so far as is possible without doing injustice to the public there shall be made available that measure of return which will maintain the properties and enable them to best meet the requirements of the public. This the commissions have done in 1917.

Light and Power Earnings \$470,000,000 in 1917

Output Increases During Year by 20.9 Per Cent, to Approximately
27,000,000,000 Kw.-hr.—October Income, \$39,300,000,
Output 2,040,000,000 Kw.-hr.

RETURNS to the ELECTRICAL WORLD from 50 per cent to 60 per cent of the central-station industry of the United States indicate that the earnings from the sale of energy for electric lighting and power during 1917 were between \$470,000,000 and \$475,000,000, an increase over 1916 of 14.5 per cent, or about

FIG. 1—CENTRAL STATION INCOME AND OUTPUT GAIN BY MONTHS IN PER CENT FOR UNITED STATES

\$60,000,000. The output of the industry which was actually sold was in the neighborhood of 27,000,000,000 kw.-hr., which is 20.9 per cent, or about 3,500,000,000 kw.-hr., greater than the output in 1916. These are absolutely the largest increases in gross earnings and output ever registered in the electric light and power industry. In fact, the increase in earnings this year over last year was almost as large as the entire earnings of the entire industry fifteen years ago, while the output increase is greater than the entire output of the industry ten years ago.

The latest month for which the ELECTRICAL WORLD has figures is October. While not so large a percentage of companies reported for that month as had been reporting previously, owing to lateness in getting out

blanks, the reports received indicated earnings from the sale of light and power of \$39,300,000 for October last, in comparison with \$34,300,000 for October, 1916, an increase of 14.4 per cent. The output for last October was 2,040,000,000 kw.-hr., an increase of 19.7 per cent over October, 1916.

TABLE I—CENTRAL-STATION RETURNS FOR TWELVE-MONTH PERIOD

	Percentage of Industry Represented	INCOME FROM THE SALE OF ENERGY			Kw.-Hr. OUTPUT		
		1916	1915	Per Cent Increase	1916	1915	Per Cent Increase
Oct.	61	22,882,000	20,164,000	13.5	1,347,502,000	1,125,132,000	19.9
Nov.	61	21,819,000	21,744,000	14.4	1,396,537,000	1,148,221,000	21.7
Dec.	62	25,306,000	22,029,000	15.0	1,345,883,000	1,112,280,000	21.0
1917		1917	1916		1917	1916	
Jan.	63	27,408,000	23,969,000	14.4	1,495,829,000	1,180,884,000	26.7
Feb.	63	25,204,000	22,295,000	13.1	1,240,995,000	1,036,014,000	20.0
March.	61	23,919,000	20,913,000	14.6	1,409,129,000	1,139,453,000	23.6
April.	63	22,927,000	20,165,000	13.8	1,328,092,000	1,085,554,000	22.5
May.	62	23,369,000	20,307,000	15.2	1,459,085,000	1,163,483,000	25.3
June.	63	23,279,000	20,168,000	15.6	1,407,860,000	1,165,629,000	20.8
July.	63	22,768,000	19,680,000	15.8	1,597,482,000	1,159,410,000	21.5
August.	63	22,718,000	19,972,000	13.8	1,451,928,000	1,223,373,000	18.7
Sept.	63	23,861,000	20,896,000	14.3	1,376,370,000	1,219,117,000	13.0
October.	51	20,026,000	17,509,000	14.4	1,037,206,000	866,871,000	19.7

Even though the industry has grown to more than two and one-half times what it was five years ago, the percentage of increase is still high. The maintenance of a constantly higher percentage increase indicates an industry which is growing much more rapidly in gross business.

The necessity for a sure supply of power and a quick supply, coupled with the coal situation, has been responsible perhaps more than anything else for the growth of the central station industry during 1917. Large, however, as the industry has grown, it is by no means so large as it would have been had there been available additional capital and additional equipment sufficient to supply the demand. Many companies have found it necessary to refuse to take on additional loads because of the now overloaded conditions of the plant. How much greater the output would have been and the consequent earnings, had money and equipment been

FIGS. 2 TO 5—CENTRAL STATION INCOME AND OUTPUT GAIN BY MONTHS IN PER CENT SECTIONALLY

in ready supply, there is no way to tell, but from the reports that come in to the ELECTRICAL WORLD it is evident that the figures here presented by no means

down power demand and, therefore, central station output. This is clearly evidenced by the returns for August and September from the Far Western States.

The accompanying diagram shows graphically the

FIG. 7—CENTRAL STATION EARNINGS AND OUTPUT DURING 1915, 1916 AND 1917

growth of the industry during the last three years, while chart No. 1 shows comparatively the monthly income and output of the industry during 1917 as con-

represent the entire demand which was placed on the electric light and power industry.

Local conditions of strikes and inability to obtain sufficient labor supply have acted in many instances to cut

trasted with 1916. The remaining curves show graphically by sections the percentages of increase in the industry over the corresponding month of the previous year as contained in Tables I and II.

Growth of Electrical Revenue in Fifteen Years

Graphical Representation of Earnings for Central Station, Electric Railway, Manufacturing and Telephone and Telegraph Branches of the Industry Since 1902

SINCE 1902 the earnings of the electrical industry have grown, as shown in the graph on this page, from a sum of about \$550,000,000 to around \$2,550,000,000. These figures include returns from the following branches of the industry: central station, electric railway, manufacturing, and telephone and

telegraph. With the exception of those for 1917, which are estimates by the ELECTRICAL WORLD, the values were taken from census figures.

The graph also includes central-station kilowatt-hour output, which in 1917 was in the neighborhood of 27,000,000,000 kw.-hr.

Organizing Operating Staff to Meet Emergencies

Means for Assuring Communication with Different Parts of System—How Trouble Reports Are Handled—Operating Data Plotted in Order to Aid Analysis of Conditions

BY E. P. PECK

Superintendent of Operation Georgia Railway & Power Company

IN THE course of a few years the system of the Georgia Railway & Power Company has grown from a small utility furnishing energy to Atlanta and a section of the neighboring territory to a great corporation consisting of six interconnecting generating plants, purchasing power from two companies, exchanging power with another and delivering power to a fourth company. Every municipality within its territory is being supplied with energy, as is also practically every industrial plant. Important plants which have recently contracted for energy that are essential during the present crisis and require continuous service are in the cotton-mill, steel, mining, fertilizer and cotton-oil industries. In round numbers, the company has increased its output in 1917 approximately 86,000,000 kw.-hr., as against 23,000,000 kw.-hr. in 1916, a record year. The estimated load for 1918 is 258,300,000 kw.-hr.

KEEPING PACE WITH GROWTH

Keeping pace with this enormous growth of the system and insuring continuity of service at all times have been the big problems confronting the operating department. These have been solved, however, by organizing the department as explained below.

The operating department of the Georgia Railway & Power Company has three main divisions—operating proper, station and substation maintenance and repairs, and operating records. The hydroelectric stations and substations, transmission lines, overhead and underground distribution are maintained by other departments, although the operation of all is directed from the load dispatcher's office.

The system operation is under the control of a chief load dispatcher, who may be considered on duty all the time and whose presence is required in the dispatcher's office during the morning and afternoon peaks. He is assisted by three load dispatchers, who work in eight-hour shifts. Two clerks work in eight-hour shifts from 6 a.m. to 10 p.m., handling the customers' trouble reports, arc-lamp outages, etc.

Regular operating instructions, like cutting in and cutting out machines, lines, etc., are given by the dispatcher on duty. During serious trouble operations are handled by the chief load dispatcher directly, or indirectly through the dispatcher on duty.

In the dispatcher's office is a large map covering one wall of the room which shows all lines, stations, company substations and large customers' transformer stations. Detail prints show the layout of each station and substation, all switching points on the lines, telephone booths, etc. There is also a plug board for keeping track of machines and lines in service.

The dispatchers keep an all-station report giving the hourly loads on each line and station in the system. The "system log," which is made out in this office, shows the time of all switching and interruptions and

is a record of all clearance orders, and in fact everything of importance occurring on the system.

In addition to five telephones connecting the office with the Bell Telephone and Atlanta Telephone companies' exchanges, there is a private-line telephone switchboard on the dispatcher's desk connecting with all of the company's stations, substations, shops, trouble stations and offices of the electric department officials. The private lines are used for general system operation. One interesting feature of the telephone system is that the high-tension telephone lines, which parallel the 110,000-volt power lines, are so fully protected that the lines have been operated in series with a 3-mile (4.8-km.) underground telephone cable to the dispatcher's telephone board for several years without having a single case of cable or switchboard trouble due to high voltage from the overhead lines.

Instructions covering the procedure to follow after interruption to any parts of the service are provided at each station. The instructions cover the method of clearing lines or apparatus in trouble and restoring service as far as possible. The operators are told what to do in case telephone connection with the dispatcher's office is interrupted. The dispatcher knows that, if he cannot communicate with a station to give instructions regarding the restoration of service, certain operations will be made in a given order, so he can handle the rest of the system accordingly.

A series of instruction booklets are being prepared, one for each station, which tell each operator in detail how to start and operate every individual machine in his station. As some of the stations have reciprocating engines, turbines, railway rotaries, 2300-volt customers' circuits, arc circuits and supply lines from other stations, these instructions will be somewhat bulky. However, it has been found that such written instructions are necessary, at this time particularly, since a large number of changes are being made continually in the operating force.

HOW TROUBLE REPORTS ARE HANDLED

All reports of trouble in any part of the company's system, including distribution, are received at the dispatcher's office. Trouble reports from the customers are turned over directly to a group of troublemen who report back to the load dispatcher. When trouble occurs on a transmission line the load dispatcher gives the transmission-line troublemen instructions regarding sectionalizing the lines for tests, and in case of ordinary troubles he handles all of the repairs. If the trouble is extensive, however, it is referred to the superintendent of transmission, who takes charge of the repair work. All transmission-line troubles are reported to the transmission department, even though the dispatcher is handling the details. All station and substation trouble reports are passed through to the test and repair department.

The test and repair department has a well-equipped repair shop and testing laboratory, with a large force of repairmen and testers. This department locates and repairs all troubles in the local station and substation apparatus and often assists other departments in locating and repairing troubles of an unusual nature in their divisions of the work. The department has had to enlarge its facilities very greatly since the beginning of the war.

Pieces of equipment are being repaired and worked over in the shops at present which in former times were considered absolutely beyond repair. An illustration of this is a transformer which had a hole burned through a section of the primary winding, leaving a number of turns open and the ends separated by several inches. These turns were repaired by welding in new sections of copper, wrapping with silk tape and adding new coil insulation. After making the repairs, the transformer was given a severe test and put back in service. The total time of repairs was about three days, whereas several months would have been required to obtain a new coil from the factory. Repairs of such a nature would not have been considered four years ago.

This test and repair department also makes weekly inspections of all of the company's rotary converters, paying particular attention to the alternating-current and direct-current brushes and circuit breakers. The relays on all lines and machines are subjected to an operating test weekly and to a thorough check test by a tester at regular intervals.

INSPECTING THE STATIONS

At least once every week a station inspector visits all of the stations in the Atlanta district, inspecting generators, rotaries, transformers, switches, circuit breakers, auxiliary machines, condition of building and structure, general housekeeping, etc. Oil samples are taken from each high-voltage station transformer and break-down tests on the oil conducted every two months. Reports of every inspection are sent to the superintendent of operation, who issues orders to the proper department covering repairs to any defects found by the station inspector.

Records of the loads of all stations are also sent to the operating superintendent's office. A report of the daily output of all generating stations is made, which is sent to the company officials who are interested. In addition, a number of monthly reports are made showing the grouping of load in various divisions. From the kilowatt peak records and the kilowatt-hour records tabulations and curves, showing hourly, daily and monthly load of each different class of service, are made. The monthly curve sheet also shows the water elevation in the storage reservoir.

All who receive the daily load record sheet also receive a daily interruption report. On this sheet are given interruptions to every class of service, the time the service is interrupted and the cause of the interruption. At the end of each month the interruptions are classified according to the district and class of service, and a summary is made with the same classification.

From the daily interruption reports the operating department works up interruption analysis reports which have been found very valuable. One sheet is

made out for each system, supply and plant and each hydroelectric distribution line. This makes a total of twenty-six sheets. The analysis shows the number of troubles occurring each month, grouped according to the causes. The total number of interruptions each month and the percentage each month are shown, also the total number due to each cause and the percentage of troubles due to each cause. There has been so much demand for this report that all totals have to be extended and copies sent out each month. A total of more than thirty monthly reports is sent out from the operating office.

OPERATING DATA PLOTTED TO AID ANALYSIS

Very close account is kept of all costs in the operating department. The data are plotted on curves which show the average monthly cost of the previous year and labor and material cost for each month of the current year. There are twenty-nine of these curve sheets, showing salaries and expenses of the operating department proper, salaries and expenses of the testing and repair department, operating expenses of each station and substation, and repair and maintenance expenses of

each station and substation. If any unusual expenses occur during the month, a note is made on the curve showing the reason for the change. This system of keeping expense records has aided considerably in reducing operating expenses at a number of different points.

Practically every variable of which a record is kept is transferred to a curve sheet. This, of course, in the aggregate, requires considerable work, but the clearness with which variations are shown and the ease with which these variations may be compared more than overbalance the cost of the work.

Summarizing, the operating department directs the loading and operation of all stations, substations and lines. It maintains the stations and substations in the central part of the system known as the Atlanta district. It keeps the operating records and works up reports on loads, interruptions and costs.

Spirit of War in the Central West

Electric Utilities Are Patriotically Mobilizing Their Large Resources to Meet the Heavy Demands for Service

SINCE the United States declared war against Germany the central stations of the country, especially in the Central West, have been called upon to introduce readjustment measures of considerable importance. They have supplied men, material and money to help win the war. They have been asked to give more service at a time when the essentials of service, being also the essentials of war, are very costly and scarce. At the beginning of the new year they can look back on the past nine months as a period of constructive achievement, of uncomplaining sacrifice, in which a firm foundation was laid for greater service to the national cause. To give a perspective on this creative work it is fitting to enumerate war-conservation measures which these central stations have taken. Such an enumeration will also serve as a guide in shaping future course and will assist in overcoming handicaps which are to be expected in the coming year.

The problems of both labor shortage and lack of capital for extensions are pressing. Both are difficulties so immediate that plans for conservation receive constant attention. The following is a partial enumeration of methods by which capital is being conserved:

New work deferred.

Many free extensions eliminated and the cost of others transferred to the customer.

Unnecessary repairs deferred.

Existing apparatus rearranged to take more load.

Stocks of material on hand reduced to minimum.

Postponement of municipal improvements encouraged.

In new business selection, where possible, of that with off-peak qualities.

Length of time on deferred payment sales plans shortened.

Customers in arrears eliminated.

So far as capital is concerned, the general policy can be summed up in the query, "What can we get along without?" Estimates indicate that in spite of the

war something more than 50 per cent of normal capital requirements will be expended in 1918 by some very large companies, because these expenditures are absolutely necessary. The increase in business is so large that companies must provide the physical capacity for it by extensions which over a period of years will approximate the average increase in demand. Contracts made before the war enter into this situation. Work will be deferred in some instances if apparatus contracts can be canceled or set further ahead.

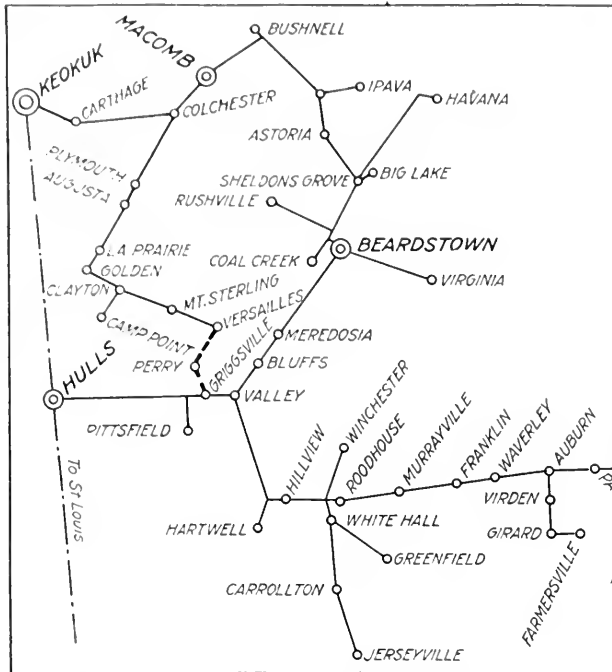

Free extensions have been eliminated in co-operation with the public service commissions, which in general have come to the aid of companies. The postponement of repairs is being handled with judgment, as it is not the intention to permit property to deteriorate through want of necessary replacements. Rearrangement of existing equipment to get greater use factor is being practiced with station apparatus, transformers, etc. The practice of reducing stocks of material is watched carefully, because of uncertain deliveries and transportation. Much effort has been directed to secure co-operation of municipalities in postponing municipal improvements calling for extensive changes in equipment of the companies.

Capital has been conserved further by constant encouragement of the greatest use of power service on an off-peak basis, and manufacturers have co-operated by opening and closing shops at different hours. This not only broadens and reduces power peaks but in some instances is a help to electric railway conditions. Companies have set an example in this practice. In granting credit on larger appliance sales or house wiring, eight months is now considered ample time, whereas twelve months was given formerly. In some cases municipalities have not paid for street lighting for several years, and the illumination has been continued out of civic spirit. It is now being found necessary to stop this.

Some companies have set a "dead line" on all accounts at forty-five days. All of these steps are being taken at a time when new business is clamoring for service.

In the labor problem Middle Western companies have been equally resourceful. Many ways have been developed to lessen difficulties arising from the shortage, as for example:

Organization and duties of employees rearranged.
Women employed.

COLCHESTER LINE WILL RELEASE 18,000 TONS OF COAL A YEAR; THIS IS MORE THAN FOUR TIMES THE SAVING MADE BY LIGHTLESS NIGHTS IN CHICAGO

Labor-saving devices and methods installed.
Schools established to train employees.
Young men in schools employed on part-time basis.
Welfare activities curtailed.
Statistical data formerly furnished to all departments have been eliminated.
Branch offices discontinued.
Package charge established for delivery of lamps or appliances.

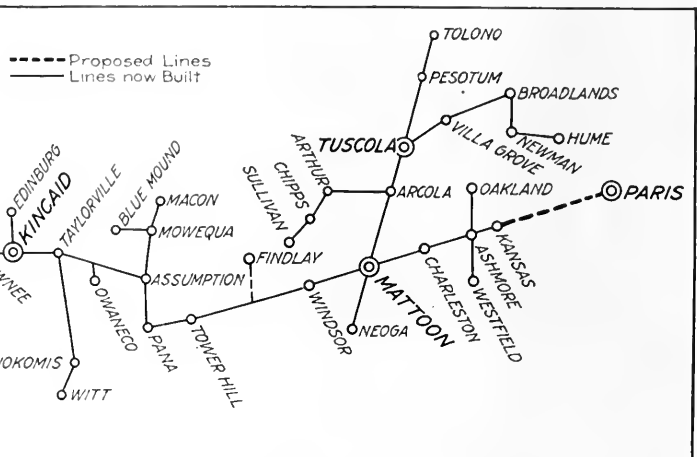

SWEARING IN RECRUITS IN MERCHANTS' HEAT & LIGHT COMPANY (INDIANAPOLIS) ELECTRIC SHOP

Departments formerly separated have been consolidated under one head. All department heads of one large company were drafted. These positions, that for-

merly carried \$250 a month, were filled by eight-dollar clerks, whose salaries were raised to \$125 or \$150 at the start. Women were employed in place of the clerks. The attitude of these clerks following the change was not commendable, but the women have proved very efficient. In fact, the experience of the companies is that women in all clerical work, some commercial work, some shop work, and in street-car washing, have been remarkably satisfactory. Most central-station offices, it is believed, have places for more labor-saving devices than they now possess. There are also many opportunities for eliminating lost motion.

Certain types of skilled labor present a large problem. With substation operators, for instance, the employment department of any large central-station company might not in six months receive an application from

a man. Yet one large company may lose in the next ten months about 140 trained substation employees. These operators have acquired knowledge that can be gained only through four months of intensive training after an apprentice course which also takes time. This company will train additional substation operators so that it will have men to put in the places of its trained forces as they leave. It is selecting men beyond the draft age. Certain companies in cities which possess vocational schools are employing students one-half day each day in positions for which the school is aiming to fit them. This plan is inexpensive and is said to be successful.

In the conservation of fuel most commendable patriotic work is being done. The lines of this effort may be listed as follows:

- Tying in with water power.
- Tying in with large station plants.
- Economies in existing plants.
- Purchase of mines and cars.
- Changing sources of fuel supply.
- Placing steam-heating customers on meter basis.
- Overhauling office and plant-heating systems.
- Enforcing electric sign orders.
- "Skip-stop" electric railway service.
- Lowering quality of steam-heating service to give 68 deg. Fahr.

A famous low-head hydroelectric plant, hitherto loaded only lightly, has been of great value to surrounding steam plants as a means of coal saving. Soon by a single connection to this plant a central Illinois company will take 3000 kw. off its steam stations. On

the basis of 4 lb. of coal per kilowatt-hour and a 35 per cent load factor, this means an annual saving of 36,000,000 lb., or 18,000 tons, of coal.

In the Lake Superior iron range district transmission lines from a hydroelectric plant are nearing completion to supersede a steam plant which furnished energy for the bulk of the power operations there. In another instance a large company contracted to take all surplus energy from two near-by hydroelectric plants so that not one kilowatt of its hydroelectric rating need ever be idle and no water need go to waste there.

In an Ohio city a lighting company has taken an additional 15,000-kw. demand from the electric railway, permitting the latter to dismantle one plant. Owing to the greater economy of the larger station this change saves 50,000 tons of coal a year. The interconnection of small plants with larger plants all over the central territory is effecting a saving in fuel the value of which in the national crisis cannot be overestimated.

Many companies are pushing line extensions to outlying communities having plants operating at anywhere from 35 lb. to 12 lb. of coal per kilowatt-hour. An interconnected company's average consumption is between 5 lb. and 6 lb. of coal per kilowatt-hour, so that a real reduction is effected. Moreover, coal goes to these small companies in carload lots, and owing to methods of handling it in small towns usually the car is delayed many hours longer than if it had been delivered to a large central electric station. In addition to reducing coal consumption and permitting purchases in larger quantities, and thus effecting another economy, the large central station therefore makes a saving also in the number of cars required to transport coal as well as in the labor involved in car movement.

Fuel economies in existing plants are being made by installation of furnaces, stokers, superheaters and better plant instruments. Results engineering is accomplishing real savings, not only in larger plants but in small towns. One operator with a 2000-kw. station has his plant in such excellent condition that it produces energy on 3.52 lb. of coal per kilowatt-hour. Another

company with about 30,000 kw. of rating has reduced coal consumption per unit of energy generated 35 per cent since 1914. While the purchase of mines and cars does not directly conserve fuel, it conserves transportation facilities, which are of equal value and importance. Likewise, if an Illinois company, for instance, changes its source of supply from West Virginia to Illinois or Indiana it assists in the same great movement.

The detailed and painstaking manner in which stations are economizing on fuel is illustrated by the fact that even their own small office and plant-heating systems receive attention.

In the movement to conserve food, electric light and power companies have been of service to the nation. They have:

Used their potential positions as public utilities to urge food saving upon the public.

Started war gardens and encouraged others to do so.

Withheld admittedly fair rate advances for electric cooking and heating.

Taught home economics classes, especially in canning and dehydrating.

Electric signs, stickers on bills, newspaper advertisements, electric railway car cards, billboards, window displays and "Four-Minute Men's" speeches have been used by central stations to tell people how to save food. Serious and successful efforts were

SERVICE FLAG OF THE COMMONWEALTH EDISON COMPANY, CHICAGO

made by a few central stations to put the war-garden movement on a more sane basis in 1917. The spring of 1918 will see much more effort if the plans of the electric companies materialize.

That electric cooking rates have not been raised is a striking fact that even the manufacturers of ranges do not seem to appreciate in its full significance. It is explainable largely on the ground that as electric companies realize the inefficiency of the ordinary kitchen stove as a fuel burner and have helped to educate the housewife away from it and toward the use of an economical electric range, they do not desire to lose now the result of all their work. The continuation of classes in home economics is along the same line.

Liberality in aiding the government and war charity financing was characteristic with lighting companies. From the Central West there were several million-dollar

contributions to both First and Second Liberty Loans. A single concern secured more than 6000 members for the Red Cross. One company gave an electric show and turned over a fine profit to the Red Cross. Other war charities have been supported financially and had the assistance of sales helpers. A movement that succeeded in sending 18,000 Christmas packages to French children was sponsored by an Indiana company. At present the companies are helping to sell thrift stamps.

Men with central-station experience have been particularly needed in the war because of their engineering training. The percentage of forces of the Middle Western companies in service ranges as high as 20 per cent. One company raised a complete unit of engineers and turned it over intact to the government. It has scarcely yet been able to replace the men from its own ranks serving in this body. Besides giving its full share of enlisted men and supplying several majors and lesser officers, the industry is filled with men in non-military and unofficial government work. They are found in every position, from that of guiding executive of the State Council of Defense to clerk on the exemption board. No job is too big, no labor too mean.

SERVICE TO ESSENTIAL INDUSTRIES

But the large task has been to maintain electric service to essential industries. It is a revelation to see how thoroughly and satisfactorily this has been done. It is also interesting that this phase of the work is not centered in cities. Companies of which little is known, and which must remain unnamed, have held government priority orders on all equipment needed to get certain work completed and energy on new lines. In obscure communities central-station service is proving invaluable in underwear and clothing establishments working on khaki-colored cloth. In the larger cities the same condition prevails to an even greater extent.

At one city in Indiana 80 per cent of the labor employed is absolutely dependent on central-station power. Several companies have reported 35 per cent increase in industrial power load on account of munition business. Another company in an industrial city sold in October 42,213,000 units of service. Of these, 27,353,000 were for industrial power and 6,643,000 for transportation. A very large part of the total central-station output is going to essential industries. Among these are metal mills, mines, powder mills, shipyards, cereal works, cement mills, tire factories, overalls and apron factories, glove factories, producers of automobiles, tractors and tanks, and a thousand others which are perhaps just as essential.

THE LESSON OF THRIFT

Leaders in the industry see the silver lining without overlooking the cloud. They see definite good accruing to central-station companies from the present conservation program. Past growth has been so rapid that capital expenditures have been on a stupendous scale. The present program of saving is certain to bring to the surface investment economies as well as operating economies. It may be expected, in the opinion of Central Western officials, that this program of saving will affect the whole American nation so that when the war is over not only the utility companies but also a large percentage of individuals will have learned a lesson in thrift which no other single force could teach.

INCREASING OUTPUT WITHOUT ENLARGING THE EQUIPMENT

Generator Rating Can Be Increased 10 to 20 per Cent by Precooling Ventilating Air—Expense Entailed Relatively Small

BY JOSEPH T. FOSTER

Public Service Electric Company of New Jersey

THE question of whether to install air washers or humidifiers for conditioning and cooling the air entering generators is particularly pertinent at this time, since by cooling this air the generator capacity may be increased from 10 to 20 per cent. Furthermore, by cleaning the air possible shut-downs for generator cleaning and, what is more serious, possible burn-outs due to heavily loaded, dirty machines, may be avoided. Obviously, then, this is the quickest and cheapest method of increasing power plant capacity, and as electric companies are at this time confronted with long deliveries, delayed shipments due to present transportation conditions and labor shortages, this subject should receive special attention now.

The purpose of central station companies in includ-

FIG. 1—RELATION BETWEEN KVA. RATING, AMOUNT OF COOLING AIR REQUIRED PER MINUTE, COST OF AIR WASHER AND COST OF WASHER INSTALLED COMPLETE

ing the air washer as standard equipment on turbo-generator installations is twofold:

1. For supplying clean air, free from dust which would coat the windings of the generator and form an insulating covering.
2. For precooling the air by evaporation of water when the air passes through the film of water atomized by the spray nozzles.

Before air-washing equipment was used it was found that the dust and dirt incidental to the unloading of coal and the disposal of ashes fouled the generator by coating the air passages. It was therefore necessary to shut down the generator at least once a year for a period of five or six days for cleaning purposes. In addition to the expense of cleaning, there was the inconvenience and loss of revenue due to shutting down the unit.

Some idea of the cleansing effected by a modern-type air washer can be gained from tests which showed that it was possible to blow several pounds of soot per minute into the intake and have the air at the generator inlet perfectly free from dust.

There is a more or less widespread belief that the

humidifying of the air increases its cooling capacity on the ground that wet air, on account of its higher specific heat, has greater heat-absorbing properties. The effect of this change in specific heat is negligible as far as heat absorption is concerned, because the weight of water vapor present even in saturated air is very small as compared with the weight of the air itself. The difference in the amount of heat absorbed by saturated air as compared with dry air under a given set of conditions is not more than 1 or 2 per cent.

The precooling action of the air washer is, however, of importance. Assume a 12-500-kva. unit which requires 30,000 cu. ft. (850 cu. m.) of cooling air per minute and in which the losses amount to approximately 300 kw. at full load. The heat absorbed per hour, assuming a final temperature of 100 deg. Fahr. (37.8 deg. C.), neglecting the moisture in the air, will be as follows:

Problem.—Given a 25,000-kva. generator, to find the amount of cooling air required, the cost of the air washer and the cost of the washer installed in place.

Solution.—From the intersection of the vertical line through 25,000 kva. and the curve, run horizontally to the vertical scale. The required air is 58,000 cu. ft. (1640 cu. m.) per minute. Running horizontally to the intersection with the first curve, read on the upper scale the cost of the air washer as \$2,050. Running horizontally to the second curve, read on the lower scale \$5,500 as the cost of the complete installation.

An illustration of an air-washer installation used in connection with a turbine plant is shown in Fig. 2. The air, which is drawn through louvers and screens at the left, passes through the washer and then through the generator, from which it is discharged direct to the forced-draft blowers in the boiler-house basement.

This method of operation is employed during summer

FIG. 2—TYPICAL ARRANGEMENT OF AIR-PRECOOLING APPARATUS FOR TURBO-GENERATOR

I. Air not pre-cooled and entering the generator at 68 deg. Fahr., $0.24 \times 0.07524 \times 1,800,000(100 - 68) = 1,040,000$ B.t.u.'s per hour.

II. Air originally at 68 deg. Fahr., but cooled in the washer to 53 deg. Fahr., $0.24 \times 0.07788 \times 1,800,000(100 - 53) = 1,580,000$ B.t.u.'s per hour.

In the first case, the losses absorbed amount to 1,040,000 B.t.u.'s per hour, or 305 kw.; in the second to 1,580,000 B.t.u.'s per hour, or 463 kw. It may be assumed with fair accuracy that the losses are proportional to the squares of the currents; therefore, $I_2^2/I_1^2 = 463/305$, or $I_2 = 1.23I_1$. The terminal voltage is, of course, constant, hence the kilowatt output when the air is pre-cooled will be theoretically 23 per cent greater than with air at the higher temperature. It is more probable, however, that in practice the gain under the conditions stated would amount to 15 per cent, although gains of 20 to 25 per cent have been realized even where the natural conditions were particularly adverse.

The gain in generating capacity obtained by pre-cooling the ventilating air is large, but is obtained by the expenditure of a comparatively small amount of money, as shown in Fig. 1.

The use of the chart is illustrated by the following:

weather when it is desired to obtain the coolest air possible for the generator. The discharge to the forced-draft blowers of this quantity of heated air improves the boiler efficiency somewhat and maintains a lower turbine-room temperature.

Under winter conditions the louver opening in the outside wall is closed by a rolling door and the air is drawn into the washer from the turbine room through the side door and discharged from the generator by-pass through the sliding door provided for that purpose. Under these conditions the door into the boiler-room basement is closed.

This method of recirculating the air from the turbine room keeps the room at a comfortable temperature. It also does away with the inconvenience of having a partial vacuum in the turbine room due to the removal of large quantities of air from an inclosed space.

The washer to be purchased by the engineer should be of the size specified or recommended by the generator manufacturer, of the heaviest and most durable material, and able to cool the air to at least 85 per cent of the difference between the wet and dry bulbs. At the same time the air resistance through the washer should not exceed 0.375 in. (9.3 mm.) of water and the power consumption should be kept down to a minimum.

Bonus System for the Saving of Coal

Reasons Why Most Systems Are Unsatisfactory—Assigning Definite Tasks to Operators Rather than Requiring Results Has Been Found to Be the Key to Improved Economy in Operation

BY WALTER N. POLAKOV

Consulting Engineer, New York City

THAT the amount of coal available in this country is 17 per cent to 23 per cent short of the requirements is serious enough, but the fact that about one-half of the coal consumed for steam production is used wastefully is appalling. If the needless waste could be eliminated, the national shortage of fuel might be reduced to probably 5 per cent, which could easily be taken care of by a more judicious use of the other half of the fuel produced.

To improve the operating economy of a power plant is not a task that can be accomplished over night, however. Neither can gratifying results be obtained without first clearly defining the aims and plans for the improvement campaign or without the executives or operating officials securing the co-operation of the plant employees. The first thing to do is to place the equipment in first-class operating condition. Second, the maintenance work must be organized so that inspections and overhauling of apparatus will be conducted on a schedule frequent enough to forestall damage and prevent deterioration of efficiency.

The next step will be to investigate thoroughly each unit of equipment and determine by tests its maximum inherent efficiency. Inasmuch as the results are affected by the conditions under which they are obtained, the latter should be carefully noted. When this is done the study and test researches should be conducted on a larger scale in order to establish the relations of conditions governing the operation of individual units on the all-around total plant efficiency. Inasmuch as the final aim is not the highest thermodynamic efficiency but the best operating economy, the preceding findings should finally be modified in order to determine and standardize such conditions, supplies, methods, etc., as would necessarily produce the desired result. In determining the final aims the following aspects should not be lost sight of: Best service to the community, welfare of employees, safety of all concerned, and cost of operation, maintenance, idleness and standby losses.

When this part of the work is done, and not before, can the actual task setting for firemen, engineers, switchboard operators, etc., be considered, as it is evident that with poor upkeep of equipment, unstandardized supplies and methods the operating men cannot maintain the prescribed conditions.

SHIFTING RESPONSIBILITY TO EMPLOYEE

Many easygoing owners and managers of plants, realizing that the actual performance is falling short of that possible, often shift the responsibility from their shoulders to those of the employee by offering a premium for performance which is sufficiently better than the present, leaving it to the employee to secure the "better results." In such cases the management side-steps its duty in not saying *how* the better results can be accomplished and *what* they shall be. Such methods

are sometimes advocated as giving the employee freedom to develop his ingenuity. This sophistry is easily exploded when it is considered that the operating man seldom has time for investigation and researches. His hands are full keeping the wheels turning. Furthermore, measuring and indicating instruments and devices are often lacking. The peculiar requirements of a research man—highly developed power of abstraction and observation, ability to concentrate on one problem to the exclusion of all others—are faculties which are seldom, if ever, found in men engaged in routine operating work.

MANY BONUS PLANS UNSATISFACTORY

It is generally conceded that higher efficiency warrants higher compensation and that stimulation for efficient work is necessary for its perpetuation. However, the lack of careful study of the subject is responsible for many misconceptions. Most of the methods of extra compensation are unsuitable, yet no better plan can be adopted unless the principles and operating conditions are properly organized. The faulty methods may be classified as follows: (a) Profit-sharing plans; (b) premium schemes, and (c) rewarding individual efforts.

Profit Sharing.—Profit sharing is based on the assumption that the employees by their work contribute to the success of the enterprise in securing profits. This would be entirely correct if the employees had the opportunity to control all functions of management, fix the salaries of directors and direct purchases and sales, besides having a veto in financial transactions. As long as they are expected, however, to work under the conditions provided by the management, with equipment and material furnished by the management, which in turn disposes of the product, the profit or loss is only slightly influenced by the excellence of the work done by the men. If dividends are not declared, the workmen lose their share, perhaps through no fault of their own, since even if they have been working as hard as possible, blunders in policy and mismanagement will offset any good they have done.

Premium Plans.—Premium plans, as worked out in power plants, are very unsatisfactory. The common error of all the attempts in this line is that the final cost of operation is considered as a basis for the award or denial of the premiums. Yet it is perfectly clear that the cost depends not only on the excellence of work but equally, if not in a much larger degree, upon the method and means of upkeep, cost of fuel and supply and its quality, quantity of output, load factor, use factor, etc. None of these factors is under the control of the power-plant employee. Besides, the extent to which different employees contribute to the attainment of economical results is very unequal. While the firemen may effect as much as 50 per cent saving, the

switchboard operator cannot influence more than, say, 5 per cent, whereas the floor engineer can save or waste about 1.5 per cent at the most.

The unsuitability of the premium plan was forcefully demonstrated several years ago in a plant where employees who had been accustomed to earning premiums were unable to do so any longer owing to the use of poorer coal and a reduction in load.

Rewarding Individual Effort.—The rewarding of individual effort is perhaps the most unscientific scheme of all. The same objection exists that was cited before—the responsibility for securing better results is shifted onto men who have no authority to alter the conditions under which they are expected to produce results. The common error in applying the reward is to select arbitrarily one or more isolated factors, like CO₂ in flue gas, carbon in ashes, etc., and reward men

conditions of various plants called for different standards.

The work of establishing standards of performance was based not on actual experiments but on average statistical data of the past, reduced by the guessed percentage suspected as waste. Then an allotment was made for each individual plant as to how much fuel should reasonably be consumed there per month. Similarly, pay rolls were revised and certain labor costs were assumed as reasonable. These two records multiplied by constants arbitrarily chosen (6 for fuel and 4 for labor) added together and divided by 10 gave the figure of merit used as a basis for the payment of bonus, the bonus itself being adjusted on a sliding scale.

The shortcomings of this crude method are apparent:

1. Men are left to discover for themselves how to secure the results desired by the management.
2. The management, shifting the responsibility to the men, was uncertain as to the exact amount of saving accomplished due to individual efforts, and therefore could not fix a definite bonus.

TASK-SETTING PLAN THAT BRINGS RESULTS

As opposed to all these methods, the writer advocates the assignment of a well-defined task to each member of an organization. The setting of a task presupposes the complete and detailed knowledge of each and every process performed in the plant and includes reliable information as to what each unit of equipment can do and what are the conditions producing the desired results. This knowledge, once gained through test and research work, is made available by instructions and training. Results necessarily follow conditions; therefore the task really consists in maintaining conditions as prescribed, not in attaining results, inasmuch as they are assured if all requirements are complied with.

To determine whether the men live up to their instructions, and consequently whether they earn their bonus, it is often convenient to judge by final results. However, these are not necessarily definite indications, since results may fall short of predetermination because of conditions beyond the control of the employee. To illustrate: Boiler efficiency may materially drop through no fault of the fireman if baffles and arches in the boilers are not maintained, owing to poor planning, lack of material, etc. Steam consumption may increase above what it should be if cool condensing water is not available. The man may fail to remove the ashes in the prescribed time if the locomotive batteries are not properly charged, the cleaning schedule disorganized, etc. It would be obviously wrong to deny the bonus to the employee who did all that was expected of him but who was unable to produce results through the fault of somebody else or something that could not be prevented by him.

Under such conditions an investigation should be made, not to verify the results, but to find out whether the conditions prescribed by the instruction card were lived up to. If they were, that is all that was expected from the employee and his bonus should be allowed him. This basic principle should apply in all cases. Favorable conditions may produce results slightly better than specified, yet they do not call for any additional reward since they evidently are not due to any extra work on the part of the employee. In other

COMPARISON OF RESULTS SECURED IN PLANTS RUN BY RULE-OF-THUMB AND BY SCIENTIFIC METHODS

obtaining the best results. It is generally overlooked that any one or several of these factors do not indicate the true performance of the whole process. It is often wise to lose in one direction in order to gain more in the final result. Moreover, it is absurd to request men to secure better results without teaching them how to do it and without providing them with instruments showing the progress made.

If one of the advocates of these short cuts would take pains to investigate any of his hobbies—whether high CO₂, or low flue temperature, or good ashes, or anything else that can be produced—he would find that the relation of the factors is complex enough to warrant detailed study. Furthermore, good results cannot be expected unless the equipment used is maintained in first-class operating condition and the supplies furnished are the most suitable and of uniform quality.

A glaring example of inconsistency of the individual-reward plan is offered by the experiences of a Western railroad. Here it was recognized that the actual performance was worse than that possible, and that local

words, the bonus remains constant as long as the terms of the instruction card are complied with, irrespective of whether the results are equal to, above or below a certain predetermined value. In case results are below a specified mark the bonus should be paid in full or not paid at all, depending on the investigation previously mentioned, but never should the bonus be reduced.

TABLE I—TWO TYPICAL REPORTS SHOWING INCREASE OF EFFICIENCY FROM ADOPTION OF METHODS OUTLINED IN TEXT

CASE I		
	Representative Week 1917 (Nov. 17, 1917)	Corresponding Week 1916 (Nov. 18, 1916)
Total coal used, lb.	141,280	506,240
Coal equivalent in shavings, lb.	31,350	38,450
Total fuel used, lb.	472,630	544,690
Total water evaporated, lb.	1,901,170	4,625,250
Actual evaporation, lb. per hr.	10.37	8.51
Average steam pressure.	58	56
Average feed temperature, deg. Fahr.	170	168
Factor of evaporation	1.073	1.075
Equivalent evaporation from and at 212 deg. Fahr., lb. per lb. coal.	11.12	9.15
Average B.t.u. per lb. coal.	14,800	13,550
Boiler efficiency, per cent.	72.9	65.6

CASE II		
	Representative Week 1917 (Nov. 24, 1917)	Corresponding Week 1916 (Nov. 25, 1916)
Total coal used, lb.	452,480	526,400
Coal equivalent in shavings, lb.	29,700	40,350
Total fuel used, lb.	482,180	566,750
Total water evaporated, lb.	5,045,800	4,837,800
Actual evaporation, lb. per hr.	10.45	8.55
Average steam pressure.	58	57
Average feed temperature, deg. Fahr.	163	176
Factor of evaporation.	1.081	1.067
Equivalent evaporation from and at 212 deg. Fahr., lb. per lb. coal.	11.30	9.12
Average B.t.u. per lb. coal.	14,800	13,550
Boiler efficiency, per cent.	74.0	65.4

The knowledge of how to do things properly and the strongest desire to work according to the best methods are of no avail unless the conditions are such that it is possible to apply these qualifications. It is a well-known fact that the daily performance in a plant operating under old-fashioned management falls short of the results obtained during a specially arranged test. This is due chiefly to the failure to plan the work ahead and permanently maintain the conditions prevailing during the test.

In considering conditions which should be maintained to secure the best economy the elimination of causes producing fatigue should be given first rank, as in power-plant work neither the best of machinery nor excellent supplies can produce satisfactory results unless they are handled by men who are not tired, mentally or physically. From experiments conducted with firemen the writer has found that, other conditions being equal, a fireman on a twelve-hour watch is about 4.5 per cent less efficient than the same man on an eight-hour shift.

No one familiar with the common layout of a power plant can over-emphasize the importance of hygienic conditions to enable men to live up to their task day in and day out. While engine rooms not infrequently offer very pleasant and sanitary surroundings, boiler-houses, the most important part of any plant, are often so built as to make them unbearably cold in winter and uncomfortably hot during the summer. Good lighting is so unusual that after looking into the furnace a fire-

man can seldom read the gages or examine anything around the boiler. Good drinking water is rarely provided, and restful seats with backs (seats without backs are as bad as no seats at all) have never been found by the writer in any boiler house. If provided with seats having backs the firemen can clean the fires twice as rapidly as without them.

The absence of elementary conditions of comfort in a working place where the men spend the greater part of their lives is more harmful to the employers than to the employees. Petty annoyances and feelings of discomfort divert the attention of the men from the performance of their duties to means of avoiding the annoyance. Steady attention on the part of the firemen is much more important than is generally realized.

Of no less importance is the hygienic surrounding on the switchboard gallery. Flickering light from lamps on a low-frequency circuit, glare on the glass fronts of instruments, cement floors to walk on, inconveniently located telephones or telautographs, too low log desks, etc., are all excellent means to increase steam consumption per kilowatt-hour and reduce the safety to men, property and service.

It should be at least as much the duty of a management periodically to investigate and test the effect of surroundings on the attentiveness and physical fatigue of men as it is its duty to test coal deliveries and supervise the treatment which equipment receives. There are many ways to ascertain the degree and the character of fatigue, but reference thereto will not be made here for lack of space. Whatever the methods may be, they should be applied at regular intervals to each and every employee, and their individual health-record cards should be kept, using some convenient rating to watch easily the decline or gain of vitality of each man. Should the decline be noticed, measures should be taken at once to find out the cause. If it is of individual nature, good advice or doctor's services should be offered. If it affects a group, the harmful condition must be eliminated as rapidly as possible. Little alterations that are usually required to remove harmful conditions are a great deal cheaper (not to say humane) than breaking in and training a new employee, or even a temporary substitute.

To conclude this rather condensed outline of the prin-

TABLE II—IMPROVEMENT IN PENNSYLVANIA PLANT BY SETTING TASK WORK AND GIVING BONUSES

BOILER ROOM

ciples advocated by the writer, it might be of interest briefly to review a few typical cases where this mode of management has been adopted.

Several years ago the writer was asked to specify additional boiler equipment in a plant containing ten

Manning boilers equipped with Jones underfeed stokers. To-day the old plant satisfies the 30 per cent increased demand, using only seven of the old boilers, and the efficiency, which had been slightly below 50 per cent, is now about 73 per cent. No investment of any kind for generating equipment was made, but about \$2,000 worth of instruments was provided, which yields 400 per cent interest. After the instruments were provided and the efficiency raised from 50 to 65 per cent by stopping various leaks, further progress was made by training employees in maintaining high boiler efficiency.

In a Pennsylvania public utility company, where the average efficiency as established by an eighty-day observation of hand-fired Edge-Moor boilers was 54 per cent, without any expense for replacement of generating equipment and with only a few additional instruments, the writer's methods, comprising the task work with

bonus, improved the average daily performance, as exemplified in Table II, about 33 per cent.

The adoption of the same principles in a 32,000-kw. central station, even without paying bonuses, resulted in the improvement of operating economy as represented graphically on page 37, showing how operating cost was reduced about 30 per cent. The dotted line on the chart represents the result of operation of a competing plant in similar service in the same time.

There is hardly any use in multiplying examples, all of which tend to show what opportunities exist for a management which undertakes to carry out the work on the basis of facts and not in accordance with old customs and habits. The greatest industry of this era of power and electricity can thus be carried out in a manner creditable to the engineer and beneficial to the community.

Adapting Existing Lines to Increased Loads

New Outdoor Substation Was Built with Equipment That Was Taken from Other Stations—
Practicable Method of Reinsulating 45 Miles of Line While Alive—
A 26-Mile Line Loss Eliminated

BY E. B. HOOK, JR.

Superintendent Construction Georgia Railway & Power Company, Atlanta, Ga.

FACING unprecedented demands for electric power, due primarily to the many new industrial plants being built, as well as old plants and municipalities shutting down their steam stations in the neighborhood of Atlanta, the Georgia Railway & Power Company has been exerting every effort to extend its lines and provide distribution facilities so as to serve the loads thrust upon it. In view of the great shortage of material and labor this task is not only difficult but expensive. Means for giving continuous service as well as for rearranging equipment and lines

pole line, it was found necessary to raise the line potential to 38,000 volts. The work of raising the voltage on 60 miles of line was quite a job in itself, but in addition considerable preliminary work was necessary in order to prepare for the change. The line in question is the Atlanta-Stone Mountain-Monroe transmission line, originally energized through the Boulevard substation in Atlanta from the Dunlap water-power plant near Gainesville, energy being transmitted over the Boulevard-Gainesville transmission line.

In order to reduce line losses and increase the effi-

FIG. 1—OUTDOOR SUBSTATION UNDER CONSTRUCTION

FIG. 2—METHOD OF HAULING TRANSFORMERS TO STATION

necessarily had to be evolved along the most economic lines. One interesting improvement in service which was accomplished at low cost and in a short time without interruption to service is described in detail here.

Owing to a heavy increase in load caused by one of its large cotton-mill customers near the end (Covington) of a 60-mile (96.6-km.) 22,000-volt wooden-

ciency of the Stone Mountain line a 6000-kva. outdoor-type transformer station was built at Norcross, Ga. This station has two 110,000-volt incoming feeder lines from Tallulah Falls and two banks of four 1000-kva., 110,000/38,000-volt transformers connected delta-star. One unit of each bank is a spare. One operator can control the station automatically from a benchboard in-

stalled in a neat brick operating house. Either bank of transformers can be energized from either high-voltage line at will and the load automatically transferred to the bank doing duty.

Owing to the difficulty of obtaining equipment immediately from manufacturers and also to minimize the investment, the system was searched for apparatus that could be spared without causing unnecessary inconvenience. Consequently the apparatus installed at the new Norcross station was collected from various less important points over the system, the steel-frame structure being one that was dismantled and shipped from Fairburn. A standard No. 20 transmission tower was erected in its place. Three of the transformers were moved from Cartersville, three from Marietta and two from Lindale. The dismantling, crating, shipping and installing of these 1000-kva., 110,000-volt transformers was a small-sized job, as each unit weighs over 20 tons and holds 3000 gal. (11,356 l.) of oil. It was necessary before placing them back into service, after shipping, to dry each core and filter the oil just as if the transformers had been assembled new from the factory.

CONSTRUCTION OF TRANSMISSION LINES

From Norcross to Stone Mountain, a distance of 10 miles (16.1 km.), a 38,000-volt transmission line was built on 50-ft. (15.2-m.) creosoted poles. This line being energized at the Norcross station will feed the Atlanta-Monroe line at Stone Mountain, thereby cutting off the Atlanta end of the load and 26 miles (41.8 km.) from the length of the line. The line conductors are No. 20 stranded, bare hard-drawn copper, arranged triangularly, 5 ft. (1.5 m.) between wires. A special wood-pin bracket is securely bolted to the top of the pole for one conductor and a heavy treated wood cross-

arm and fastened to the top of each pole. The private telephone line, which is 30 in. (76 cm.) below the conductors, on standard 2-pin cross-arms, is transposed every fourth pole.

To raise the voltage of this line it was necessary to completely reinsulate the line, to increase the conductor spacing, to remove the overhead ground wire and to refrain from causing an interruption of even one minute to any of the numerous customers along the entire line. A moment's reflection will reveal the magnitude of this apparently impossible problem, but it was done with a crew of twelve comparatively inexperienced men, four linemen, six ground men, a cook and a foreman, in five months' time.

METHOD OF CHANGING LINE WHILE ALIVE

The first step was the removal of the overhead ground wire, which was taken loose from the pole tops and laid down on the power arms, close to the pole on the side on which there was only one conductor. The ground wire was then cut in sections of about $\frac{1}{4}$ mile (0.4 km.) lengths and pulled off ahead. A tail line was used to hold the free end taut to keep it from whipping into the live wires. Next a specially designed wooden bracket was bolted to the top of each pole with two $\frac{5}{8}$ -in. (1.6-cm.) machine bolts. The top of this bracket extends some 8 in. (20.3 cm.) over the roof of the pole. An insulator was screwed on this bracket by hand and the middle leg of the flat-spaced line raised thereto, giving an equilateral spacing of 60 in. (152.4 cm.) between conductors (Fig. 3).

This move was accomplished by means of a 10-ft. (3-m.) insulated lifting pole, 3 in. (7.6 cm.) in diameter, fastened to the cross-arm by a pivoted collar. The top of the pole is provided with a socket and safety

FIGS. 3, 4, 5 AND 6—STEPS IN CHANGING FROM HORIZONTALLY ARRANGED CONDUCTORS TO TRIANGULAR SPACING TO PERMIT HIGHER VOLTAGE OPERATION

arm attached 50 in. (127 cm.) down the pole for the other two. A private telephone line is strung on the same poles 3 ft. (0.9 m.) below the heavy arm.

The Stone Mountain-Monroe transmission line, the voltage of which had to be raised, was originally constructed in 1913 for 22,000 volts working pressure. It is on 40-ft. (12.2-m.) chestnut poles and about 45 miles (72.4 km.) long. The line conductors, which are 2/0 hard-drawn stranded-copper cable, are strung on 4-in. by 6-in. by 8-ft. (10.2-cm. by 15.2-cm. by 2.4-m.) creosoted cross-arms—two wires on one side of the pole and one on the other. The cross-arm is bolted 3 ft. (0.9 m.) below the roof of the pole and a $\frac{1}{4}$ -in. (1.6-cm.) copper-clad steel ground wire is strung above the conductors

locking jaws for holding the conductor. The pivoted collar which holds the pole to the cross-arm forms a sliding fit around the pole, so that by means of a small set of blocks and tackle a man on the ground can raise or lower the pole at the command of the lineman above, who guides the conductor into its proper position (Fig. 4).

The tie wire was wrapped around the neck of the insulator before it was screwed on the pole-top pin, a small loop left in each end, and the free ends were bent out so that the conductor could be placed directly in the insulator grooves. By means of a small prong on the end of 8-ft. (2.4-m.) switch sticks the lineman wrapped this tie wire around the line conductor (Fig.

5). With a surprisingly small amount of practice the linemen were able to tie in the hot conductor as securely as they could a dead line with a pair of pliers.

The next step was to raise the outside wires off their insulators while higher voltage units were substituted. This was done with the same apparatus, the tie wires being removed by means of a switch stick with prongs, which were filed flat to resemble the end of a screw-driver. As the tie wire was unwrapped from the conductor the free ends were sawed off every few inches with a hack-saw mounted on the end of a switch stick, which is a safety measure to prevent the possibility of the ends of the tie wire coming in contact with the cross-arm or braces as it is unwrapped. After the tie wire was removed the groundman pulled the fall line connected with the lifting pole, thus elevating the conductor and allowing the lineman to unscrew the

on the opposite end of the timber and the process reversed. The old line insulators were used to reinsulate the telephone line.

It is interesting to note that when the crew began the work of increasing the insulation on this line the foreman was the only man that had ever seen the lifting pole in service or an insulator changed on a live line. Nevertheless, the crew changed six complete poles the first day. In a week they were changing fifteen, and after the first month's work they averaged thirty-five to forty poles, a little better than one mile (1.6 km.) per day.

Diminishing Eddy Currents

Prof. Allan B. Field, in patent No. 1,241,503, has devised a method for annulling the excessive heating occurring in the ventilating spaces of turbo-generators.

By the invention an annular laminated ring of magnetizable material is disposed in the annular vent space for the purpose of concentrating a greater portion of the magnetic lines of force entering the vent space and diverting the path in a direction parallel to that of the lines of force traversing the field magnet and magnetizable core members. This arrangement prevents to a large extent the fringing of the magnetic lines of force into the sides of the vent space, with the resulting circulation of eddy currents. As an additional aid toward the accomplishment of the same result, a series of introgressively stepped portions of the core on each side of the vent space is also provided.

Dynamo Brushes with Phenol Resin as Binder

J. Ernest Thomsen of Jersey City, N. J., in patent No. 1,245,009, assigned to the Dixon Crucible Company, suggests the use of the new phenol resin compounds as a binder for carbon brushes for dynamo use. In producing the brushes finely divided carbon is mixed with a phenol or creosol or a compound or mixture containing phenols and creosols, such as pitch, tar or creosote oil, and formaldehyde or a formaldehyde derivative and hexamethylenetetramin. It is preferable not to have the carbon content of the mixture reduced to a uniform degree of fineness. It should preferably consist of particles of graphite of different sizes. If formaldehyde is used, then it is desirable also to add a small quantity, of alkali, as, for example, ammonia, to the mixture.

The strength of the final material as well as its electrical conductivity may be varied by varying the proportion of the carbon to the other ingredients in the mixture. One formula found to give a very satisfactory product is as follows: 64 per cent carbon (containing particles of different sizes), 8 per cent of coal tar, 15 per cent creosote, 3 per cent hexamethylenetetramin. This mixture is then heated to a temperature not exceeding 450 deg. Fahr. (232.2 deg. C.) to drive off the volatile matter, and the remaining mass is ground to a powder.

The powder thus formed is then pressed into molds at a pressure which must vary according to the hardness and density desired in the product. When making the electrode for use as a motor brush, a pressure of 2 tons per square inch (281 kg. per sq. cm.) is satisfactory.

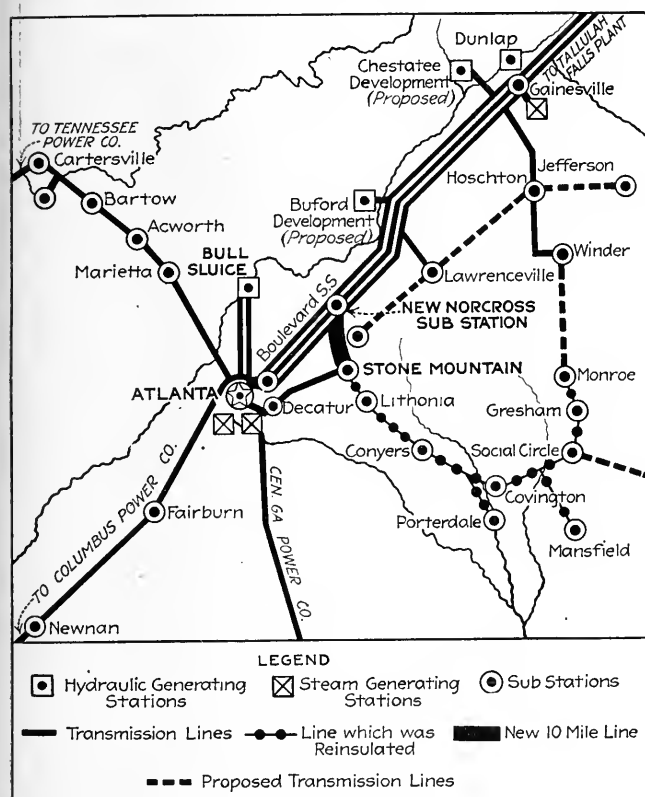

FIG. 7—MAP OF SECTION OF SYSTEM INVOLVED BY CHANGE

old insulator and substitute a new, higher-voltage unit equipped with a tie wire. The conductor was then lowered and tied in as outlined before. The lifting pole was then shifted to the other end of the cross-arm and the third conductor changed in a similar manner.

While making these line changes one of the linemen noticed that a large proportion of his time was consumed in changing the position of the lifting pole, so he obtained a dry piece of 2-in. by 4-in. (5.1-cm. by 10.2-cm.) timber 6 ft. (1.5 m.) long, shellacked it carefully and cut a 2-in. (5.1-cm.) notch in each end. After raising the middle conductor and tying it on the pole-top pin, he lowered the lifting pole to the ground, suspended the treated timber at its middle from a collar around the pole, fitted one notched end over one of the outside conductors, and had the ground man raise the conductor the required distance by pulling on a hand line fastened to the other end of the timber. To change the third insulator the hand line was snapped

SHIPS, SHIPS, AND MORE SHIPS ARE NEEDED. MORE THAN A BILLION DOLLARS IS BEING SPENT TO BUILD THEM, AND ELECTRICITY IS GIVING INVALUABLE AID

Shipbuilding Expedited by Electric Service

Study of the Power Requirements and Description of the Electrical Distributing System for Staten Island Shipbuilding Company, Mariners' Harbor, Staten Island, N. Y.

BY DAVID ELWELL

Lockwood, Greene & Company, Engineers

WHEN the demand for ocean tonnage became pressing about a year and a half ago the Staten Island Shipbuilding Company found itself with a large tonnage of steel vessels contracted for and merely the beginnings of a modern yard in hand in which to build them. It was therefore necessary to provide for the completion of the yard and for an adequate supply of power. A thorough study of the best way of meeting the power requirements was therefore undertaken by the company's engineers, Lockwood, Greene & Company. An outline of this study, with the conclusions reached, is given in what follows.

The whole development comprises not only a complete engine, hull and boiler plant, but includes facilities for every variety of marine repair work, duplicating in the latter respect the company's older plant at Port Richmond. In passing it may be mentioned that this latter yard is operated from a producer-gas power plant containing 220-volt direct-current engine-type generators directly driven by gas engines designed and built by the Staten Island Shipbuilding Company.

The fact that ship repairs are made at the new yard increases the demand for compressed air beyond that required for new vessels and gives rise to a considerable use of steam. This is used for running auxiliaries, where necessary, on vessels under repair and for heating them in winter. A supply of power in addition to that required in a shipbuilding plant only is that used electrically for the operation of floating dry docks for hull repairs.

The power requirements are therefore classified as follows:

KIND OF POWER	PURPOSE
(1) Electricity:	(a) Lighting (b) General motive power (c) Dry-dock operation (d) Air compressors if electrically driven
(2) Steam:	(a) Heating (b) General use around the yard and on ships undergoing repairs
(3) Compressed Air:	(a) Pneumatic tools (b) General yard use

The foundry and pattern shop and storage buildings are about one-third of a mile (5.3 km.) back from the shipyard proper. A low-pressure steam-heating plant was installed there with indirect heating by air circulation for the foundry and direct radiation elsewhere. Alternating-current energy from the lines of the Richmond Light & Railroad Company was at hand when these buildings were completed and was therefore used for woodworking machinery in the pattern shop and for cranes, cupola blowers, etc., in the foundry.

The power load of the foundry being of a limited amount, the heating was preferably handled by a local boiler, as steam pipes from a main boiler plant at the shipyard would have had to traverse public streets for quite a distance. The demand for steam and electric

power here was not enough to have a definite influence on the power calculations in the shipyard. The main yard had a 220-volt direct-current power plant, but being entirely inadequate and in a location needed for other purposes in the new development its use could not be considered.

POWER REQUIREMENTS AND RELATION OF DEMANDS

Studies were made to determine the amount of power required for the various purposes mentioned, the kind and relation of the different demands and load curves.

FIG. 1—ARRANGEMENT OF METERING AND SWITCHING EQUIPMENT IN MOLD LOFT

Regarding the lighting requirements, eighteen different buildings (excluding the foundry group) had a demand of 60 kw. For motive power in the buildings, exclusive of compressors, cranes and direct-current requirements, it was found that the average requirement would be 420 kw., with a 500-kw. maximum.

For the three floating dry docks a maximum demand of 500 kw. was computed, with two docks in simultaneous operation, although the annual consumption is only 150,000-kw.-hr. approximately. The actual pumping period varies from one-half to one and one-half hours, according to the size of dock, and the annual power consumption is based on 100 hauls per year and an equal number of pumping periods for setting the keel blocks. For the operation of air compressors, if electrically driven, it would be necessary to have 250 kw. for each of two compressors and 500 kw. for a larger unit, making a total of 1000 kw. This represents a total capacity of about 7000 cu. ft. of air per minute (198.2 cu. m. per second).

On account of the exacting service required of cranes, particularly in the boiler shop and in the machine shop for assembly of engines, etc., and to secure the benefits of dynamic braking, direct-current cranes were preferred to alternating-current cranes. A considerable demand for direct-current energy arose from various adjustable-speed drives in the shops, on machine tools and the electric winches for handling steel at the shipways. This direct-current requirement constituted another item of electric power to be taken into account, running about 300 kw.

Regarding the steam requirements, it was found that 12,000 lb. (5443 kg.) of steam per hour at 2 lb. to 5 lb. (140.6 g. to 351.5 g.) pressure was the maximum necessary for heating, some buildings requiring heat in

whole or part and at temperatures of 50 deg. to 70 deg. Fahr. (10 to 21.1 deg. C.), according to occupancy. High-pressure steam requirements for general use in the yard and for live-steam lines to vessels under repair for driving auxiliaries and heating ranged from a minimum of 75 hp. to a maximum of 400 hp., according to conditions.

All reasonable methods of running the plant were assembled as follows for study:

- I. 1. High-pressure condensing turbines for power, lighting and dock pumping.
2. High-pressure steam-driven air compressors, (a) non-condensing, (b) condensing.
- II. 1. High-pressure non-condensing air compressors.
2. Mixed-pressure turbines for power, lighting and dock pumping.
- III. High-pressure condensing turbines for power, lighting, dock pumping and air-compressors—motor-driven.
- IV. 1. Purchased electric power for lighting, power and dock pumping.
2. Steam-driven air compressors, (a) condensing, (b) non-condensing.
- V. Purchased electric power for lighting, power, dock pumping and air compressors.

Under scheme I it was found that any steam saved by condensing operation of compressors was offset by that required for condenser drive and by the live steam which was required for heating in lieu of the exhaust otherwise available, not to mention the added investment.

With scheme II it was found that the compressors at full load would not pass enough steam to mixed-pressure turbines to meet the demand for shop power, even excluding lighting and dry-dock operation. Consequently high-pressure make-up would always be required for the mixed-pressure turbines, with very large amounts at times of small compressed-air demand. Moreover, the compressor exhaust was just about the amount needed for feed water and building heating, so that a good part of the time the turbines would be running at very poor economy mostly on high-pressure steam. With little or no coal saving from this scheme and an added investment to cover it if adopted, in-

FIG. 2—DETAIL OF PART A (FIG. 1)

creased complication and diminished reliability, a power plant based on scheme II was definitely abandoned.

Scheme III involved increasing the turbine capacity to handle motor-driven air compressors. While the turbines would utilize the steam more efficiently than air compressors, the electrical losses of the latter, if motor-driven, would leave only a slight theoretical saving in this scheme over scheme I. This difference might disappear in actual operation, and the disadvantage of

ingly signed with the Richmond Light & Railroad Company.

Energy for the plant is taken from the electric-service company's aerial lines at a point near the purchasers' substation, which is situated at about the middle of the yard. The energy is measured by an outdoor meter installation. The line splits, one branch running up to the foundry on the power company's street pole line, while the other branch runs underground into the substation.

The essential questions arising in connection with the utilization of the electric power were the method of distribution to be adopted for power and lighting and the voltage to be used. The owners wanted to avoid any personal hazard to operatives even at considerably increased distribution cost by using as low a voltage as practicable. A motor voltage of 220 volts was accordingly adopted. In the substation there was no need of going to such a low voltage, as only the operating force would have access to the premises, therefore 440 volts was selected for serving the direct-connected synchronous motors on the air compressors.

THE LIGHTING SYSTEM

For lighting it was not desired to carry the supply voltage to the various buildings nor was it desirable to run individual low-voltage lighting lines to the different buildings. It was therefore decided to have a single alternating-current three-phase feeder for each building or group of buildings and to split one phase with a 220/110-volt balancing coil to get the desired lighting voltage. Where the lighting load would have been sufficient to cause serious unbalance on the three-phase supply, the load was distributed around the phases, each phase having its own auto transformer.

This arrangement eliminated considerable expense which otherwise would have been involved in purchasing high-voltage transformers for lighting. It increases only slightly the size of the power distributing lines and eliminates the hazard of high-voltage distribution around the yard for lighting.

Aerial distributing lines with the low-voltage employed would have been unsightly on account of their size, and the wires and poles would have interfered continually with the locomotive cranes in the yard. It was therefore decided to run the wires underground. Running underground lines in this yard involved some special considerations. The ground in the yard is largely filled with ashes and cinders and is not much above tide level. This meant that it would always be soft and wet, so that it would have been almost impossible to find a solid bottom on which to rest clay or fiber duct lines incased in concrete. Under such conditions the ducts would surely have settled and caused trouble, especially with the passage of cranes and trucks above. Furthermore, it would have been necessary to waterproof all manholes because of excessive water, and on account of the low elevation of the land with respect to the tide drainage of them would have been practically impossible. Since the yard is well filled with various structures, such as plate racks, tracks for cranes, etc., the installation of concrete-duct lines would have been very difficult. The use of steel-armored lead cable eliminated all the difficulties which the other scheme would have brought up, and it was accordingly adopted.

The substation, which is employed to house the main transformers, distributing switchboard, motor-generator sets and air compressors, is a brick and steel building and contains a traveling crane. The incoming underground service passes through a cell-mounted switch on the street end of the building and thence to the transformers. These have split secondary windings giving a full voltage of 480, which is used for the compressors. The 240-volt, three-phase circuit for the general shop motors is connected with the mid-point of secondary winding of each transformer.

Twelve feet (3.6 m.) from the street end a wire grille runs across the entire substation, with a door at each wall. This fences off the power transformers and forms a back support for the switchboard tie rods. The 240-volt and 480-volt leads from the transformers join their respective busbars on the board which is erected in front of a cable trench running parallel to the grille. A cable trench runs entirely across the power house, carrying the outgoing lines from the switchboard out through the building wall in each direction underground. A similar cable trench running lengthwise of the building, connecting with the transverse trench at the switchboard, carries the circuits to and from the synchronous motors on the air compressors, their exciters, the alternating-current, direct-current, motor-generator sets, etc.

For the outgoing underground circuits the armored cable rises from the trench directly to the switch terminals. The circuits for power-house apparatus are run in rigid iron conduit in the trenches. The trenches are provided with flush-checkered, steel-plate covers in removable sections. Automatic oil switches with transformer trip and inverse-time-element relays are mounted directly on the panels, and manually operated for the alternating-current circuits. Knife switches and carbon-break circuit breakers are used for the 220-volt, direct-current circuits.

The switchboard, except for the air-compressor panels, was furnished by the Westinghouse Electric & Manufacturing Company. The synchronous motors, their exciters and switchboard panels, were furnished by the General Electric Company. The board has been equipped as simply as possible to meet the requirements. Ammeters are provided to indicate load on each power-house circuit and outgoing line. By means of ammeter switches the current in any phase may be obtained, these readings being necessary, as the phases may be slightly unbalanced by the auto-transformers for lighting.

For purposes of cost recording the energy required for each building or group of buildings engaged in an individual manufacturing process is measured by a watt-hour meter on each feeder. In certain cases—that of the mold loft and the plate and angle-bending building, for instance—the load is light enough for a single feeder, so the segregated power for each building is obtained by watt-hour meters in the mold loft where the feeder splits.

The essential ideas which have been followed in connection with buildings and equipment are simplicity, ruggedness and thorough adaptability for the service required. These facts, together with the speed attained on the work, have enabled the owners already to deliver complete steel cargo vessels, now in service on the seas.

Effective Work of Associated Manufacturers

The Thorough Organization by Sections That Has Been Accomplished by
Makers of Electrical Supplies Found to Be of Immediate
Value for War Service of the Nation

THE Associated Manufacturers of Electrical Supplies has followed consistently the lines laid down early in the active career of this influential body. From the beginning the purpose has been to create an organization of intensely practical value to members. It was desired to form a medium through which the manufacturers might co-operate to the best advantage in developing trade relations both broad in scope and with sufficient definite direction to prove of permanent value. This medium, highly developed to a point where it is of great and permanent usefulness to members, has become a factor of great and powerful value to the government in the mobilization of industries for war.

In organizing itself more closely the manufacturing branch of the electrical industry is following the trend of developments in other branches. Among the manufacturers organization is now complete through the Associated Manufacturers of Electrical Supplies, embracing all the many and varied lines of electrical supplies; the Electrical Manufacturers' Club, an agency for bringing the executive officials together twice a year to discuss questions of policy, and the Electric Power Club, an effective established organization of manufacturers of motors, transformers and control apparatus. There is no conflict whatever between either the purposes or the actual work of these different bodies.

As is generally known, each of the three organizations has four representatives who meet in the Electrical Manufacturers' Council, providing an effective means for co-ordinating the work of the individual organizations, so that it may be unified on questions of common interest, while leaving each separate organization with a clearly recognized sphere of operation free to do special work in its own field.

The most distinctive characteristic in the organization of the Associated Manufacturers of Electrical Supplies is the extensive and intensive development through its sections. In effect, the sections carry to different lines of manufactured supplies the benefits of the main organization. It is in a sense as if the supply manufacturers were united in individual organizations and then linked together through a main association in which each one had representation. Actually, however, the membership is held in the parent organization and affiliation with sections is a supplementary procedure to membership in the association.

SECTION ORGANIZATIONS

The organization of the sections is substantially uniform. Each has a chairman, a secretary and a treasurer, with committees covering the special line of product embraced in the work of the sections, in order to centralize and develop their activities. At the commencement of the Associated Manufacturers' movement the sections appeared to be in effect committees of the main association, but they have grown even past

the expectations of the enthusiastic organizers. The attendance and interest in the work of the sections are maintained with unflagging zeal.

While each section is a unit in itself, subject to the authority of the parent association, all have problems of the same character to meet. Under these conditions the nature of the work, inquiry and investigation of the different sections has closely approached uniformity. Necessarily the steady progress in standardization and in some other directions is rightly confined to individual lines in individual sections, but there are many activities in which all sections have a common interest.

Through its representation on the general war committee of the electrical manufacturing industry assistance will be given the government in meeting its requirements efficiently and with the minimum of industrial disturbance.

WAR SERVICE COMMITTEE'S WORK

It is upon the foundation laid by the three organizations that the general war service committee of the electrical manufacturing industry has built its comprehensive, far-reaching system. As readers of the ELECTRICAL WORLD know, the general war service committee of the electrical manufacturing industry consists of two members each from the three organizations. Sub-committees will be created in each of these organizations to meet such demands as may arise from time to time. With the Associated Manufacturers of Electrical Supplies, which extends into so many distinct lines of activity involving a large membership, it has been found desirable to form about twenty subsidiary committees from the sections, representing different lines of electrical supplies. The thoroughness with which the work of organization of the subsidiary committees has been done is characteristic of the completeness with which the Associated Manufacturers' organization has been perfected in other directions.

In these committees the term "section" is abandoned. The committees are regarded as representing groups of the industry, as, for instance, the wire and cable group. It was decided to forgo the term section because members regard the war service work as primarily in the interest of co-operation with the government. They wish to cover the whole industry, not alone that part, though large, which is in the association, and they therefore offer the services of the various war committees to any manufacturer.

Without the organization of sections which has been built up by the Associated Manufacturers of Electrical Supplies it would have been impossible to form almost instantly when the demand arose so extensive a system of war service committees as has been developed. Time would have been spent in bringing people together. Trade antagonisms would have had to be overcome. In place of this feeling there would have had to be built up the new spirit of co-operation, in-

tensified beyond the powers of imagination by the entrance of the country into the world war. The necessity of doing this crudely and hurriedly under the spur of sharp necessity due to war has been obviated by the existing organization, which without delay provided the useful machinery for creating war service committees. The association formed the sections for justified trade purposes before war loomed; the country is at once benefited when war comes.

Little limitation is placed on the activities of the sections of the Associated Manufacturers of Electrical Supplies. Generally they may map out their own work and do it through such conferences or committees as seem to them to offer the most effective means. However, all that they accomplish is subject to the approval of the board of governors of the main association, acting on advice of the counsel, before it can become officially the product of the organization. Through this authority, which is exercised continually, the board of governors is able to hold the work of the different sections to conformity with the constitution and the spirit of the organization. By this method of control the sections are guided so effectively that all their activities are strictly in accord with both the letter and the spirit of the law.

On the preceding page are printed photographs of chairmen of the various sections and also of Charles E. Dustin, the general secretary, through whose office the principal work of the sections passes before action is taken on it by the board of governors.

The chairmen of the sixteen sections are:

Attachment Plug Section.—H. W. Bliven, Harvey Hubbell, Inc.

Carbon Section.—J. F. Kerlin, National Carbon Company.

Fan Motor Section.—A. F. Chamberlain, Robbins & Myers Company.

Fuse Section.—H. R. Sargent, General Electric Company.

Industrial and Street-Lighting Fixture Section.—C. O. Baker, Wheeler Reflector Company.

Insulating Materials Section.—J. G. Miles, Westinghouse Electric & Manufacturing Company.

Interior Conduit Section.—D. H. Murphy, American Conduit Manufacturing Company.

Knife Switch Section.—J. H. Trumbull, Trumbull Electric Manufacturing Company.

Lamp Receptacle and Socket Section.—W. D. Steele, Benjamin Electric Manufacturing Company.

Line Material Section.—W. R. Williams, General Electric Company.

Molded or Formed Insulation Section.—Edward B. Hatch, Johns-Pratt Company, has just resigned as chairman. R. W. Seabury, Boonton Rubber Manufacturing Company, has been elected to succeed him.

Outlet Box Section.—Frank W. Hall, Sprague Electric Works.

Panelboard and Switchboard Section.—Charles L. Eidlitz, Metropolitan Electric Manufacturing Company.

Porcelain Section.—J. E. Way, R. Thomas & Sons Company.

Snap Switch Section.—E. Whitmore, Manhattan Electrical Supply Company.

Wire and Cable Section.—LeRoy Clark, Safety Insulated Wire & Cable Company.

Formed in 1915, the Associated Manufacturers of Electrical Supplies had as its first president Robert K. Sheppard, Simplex Wire & Cable Company. H. B. Crouse, Crouse-Hinds Company, the present president, was elected in 1917 to succeed Mr. Sheppard. A. W. Berresford, Cutler-Hammer Manufacturing Company, is vice-president, and J. W. Perry, H. W. Johns-Manville Company, is treasurer.

ARRESTERS ON 150,000-VOLT ENERGY-TRANSMISSION LINE

Results of Investigations of Electrolytic Lightning Arresters on These Lines Given—Method of Overhauling Arresters

BY H. H. COX.

When the 150,000-volt Big Creek system was put in operation six sets of electrolytic lightning arresters were installed, two at each power house and two at the receiving substation. None was installed along the line at any point, but instead each string of insulators on the line was provided with arcing horns. Occasionally there are insulator flashovers, but they seldom occur within 30 miles (48.3 km.) of either the power houses or the substation. Their cause is not definitely known or understood. They occur under any and all load and weather conditions. A few cases only of actual insulator breakdown have occurred. It would appear that the protection afforded by the arresters does not extend more than 30 miles.

Probably the most important function performed by these arresters is the discharging of switching disturbances. The gap setting has been decreased from that recommended by the manufacturers until it is now only about 60 per cent of the minimum given in the instruction book. The present setting, which has been arrived at by trial method, is 10½ in. and 14 in. (26.7 cm. and 35.5 cm.) at the substation and 13 in. and 17 in. (33 cm. and 43.2 cm.) at the power houses. The higher setting at the power house is due to the configuration of the ground at that point.

Charging current is measured once a month and curves are plotted on it. Arresters at one power house were taken out of service after about two and one-half years on account of increasing charging current. The trouble was found to be that the electrolyte had coagulated. These arresters have not been put back into service. Those at the substation were overhauled and new electrolyte put in after three years' service. The charging current had not materially increased, however. Those at the other power house are still in service and are apparently in good condition after four years' service.

In overhauling those at the substation it was found that about 2 per cent of the cones were bad. These were rough and pitted on the surface covered by the electrolyte, and in every case it was plain to be seen that the trouble was due to low electrolyte. These cones were generally distributed through the stacks. When the stacks were reassembled an original method was used by which absolutely uniform filling was obtained. The cones were filled by the usual rubber tube and siphon method, but no particular care was taken about the uniformity. When full the stack was carefully leaned over against the wall until the electrolyte in a properly filled cone just started to spill over. Then those too full ran over until down to the proper level, and it was but a few minutes' work to run over the stack with a rubber tube and fill up the low ones.

In giving the initial charge after refilling only one cell was found in 2800 which would not build up the film. From the foregoing it would seem that the cones would last a long time in the service these arresters are doing.

How System Operators Can Improve Economy

Proper Qualifications of Load Dispatchers—Relations with Station Operators and Line Patrolmen—Coal Saving Proved to Be Possible Through Studying Hydroelectric Conditions

BY HARRY J. BURTON

Consumers' Power Company, Jackson, Mich.

IN ORDER properly to conserve the energies and resources of a modern interconnected transmission system, made up of hydroelectric plants, steam plants and substations, the services of well-trained, competent load dispatchers or system operators are essential. Men of broad operating experience are needed for positions of this kind. They must be familiar with the operation of steam plants, water plants and substations, and with the care and maintenance of high-tension transmission lines.

System operators are in a particularly favorable position for observing the general status of an operating department, and with the guidance of their executives should be able to bring about successful and economical operation.

To operate to the best possible advantage the authority of the system operator should extend to the lines, stations and men, in maintaining the necessary operating conditions. Emphasis should be placed upon the importance of co-operation between all departments and the system operator. Pertinent information withheld from the system operator may result in serious loss to a company.

System operators should at all times be familiar with all the operating conditions existing at the various stations, substations and switching points. They should know the kind of coal used and the cost of it, unloaded, at the different steam plants. They should know the load at which the different generating units operate most efficiently, and the information they receive must be accurate if good and efficient work is to be done. They should be kept informed of the demands for power and of all changes in load as far in advance as possible, so that they can arrange to have different units placed in or out of service at the right time.

RESPONSIBILITY OF SYSTEM OPERATOR

Generating apparatus should not be placed in or out of service without the permission of the system operator, and on small systems boiler-room men should not be allowed to cut boilers in or out of service or to clean fires without his sanction. On larger systems he should at least know how many are available for service at all times. Boiler-room economy is of the utmost importance these days, and boilers should be operated at the most efficient load. Steam plants should not be run with more boilers in service than are actually needed; that is, ten boilers should not be fired when only eight are needed to carry the load. The load curve on steam plants should be straight for efficient and economical operation; that is, a good load factor should be maintained. Boilers can be prevented from "blowing off" during the noon hour and light-load periods by an intelligent handling of the water at hydroelectric plants.

System operators should aim to take care of peak loads with water power, and, as far as is practicable,

water should be conserved for these periods. Sundays, holidays and other light-load periods can often be taken care of by means of water power, thus affording an opportune time to inspect, clean and repair steam-plant equipment.

HYDROELECTRIC CONDITIONS AND COAL SAVING

Much energy can be conserved by a careful study of water conditions at the hydroelectric plants. The nature of the watershed, the amount and time of precipitation and the climatic conditions all affect operation, and some understanding of the flow and formation of a river is needed to know how soon or how much the pond would be affected after a given precipitation or thawing. The operation of floodgates should be checked up from time to time to see that they are in working order, as failure of these gates to work at a critical time may result in much damage and loss.

The determination of the most effective gate opening and the working of water down a river, through several water plants, as well as the handling of plants at times of low and high water, are economic problems that should be worked out so that, if possible, no water shall be wasted, the plants operated at the most effective head and a degree of protection maintained at all times. When extensive repairs to lines or equipment are contemplated, making it necessary to shut down a plant for a considerable period, the system operator should be informed as far in advance as possible so that he can arrange to use all the available water; thus as little as possible will be spilled while the repairs or changes are under way.

System operators should have sketches showing the high-tension wiring in all power stations, substations and switching houses and data showing pole numbers at the principal points along the lines, such as road crossings, trolley stops, telephone test stations and other items descriptive of the lines that would be of assistance in handling intelligently any case of line trouble that may develop. They should keep themselves informed as to the immediate whereabouts of patrolmen, linemen, repairmen and all superior officers, so that there will be no delay in securing help or advice in an emergency.

Competent line patrolmen are an invaluable help to the system operator, and reliable information received from them and acted upon may not only save equipment and prevent an interruption to service but may also eliminate a long period of inefficient operation. For example, a system operator may have planned to use a certain line and plants to carry an important load, and owing to the failure of the line, or to trouble on it, he may be forced to use a line and plants less efficient, and in addition water may be wasted at some of the dams. Accurate information received from a patrolman may prevent the trouble entirely or else give the system oper-

ator time to plan for the most efficient way out of the trouble, should it prove to be inevitable.

System operators should give careful consideration to all high-tension line disturbances or surges that are reported. They may be caused by an arcing ground, and it is a well-established fact that trouble of this nature sets up surges and causes stresses, on delta-connected systems, which tend to weaken insulation on all lines and apparatus connected metallically to the defective part. Arcing grounds must be located and cleared from the system as soon as possible. An experienced operator should have little difficulty in locating transmission-line trouble on a modern high-tension system.

Weather conditions and approaching storms should be carefully noted and suitable preparations to take care of possible trouble should be made by checking up the whereabouts of patrolmen, linemen and repairmen. Reliable means of communication between the system operator and patrolmen, switching points and stations must be maintained, and the system operator should give this important matter careful thought and be prepared to act promptly should one of his lines of communication fail. System operators' messages over the private telephone line should be given preference, and it should be understood by all concerned that any instructions given by them regarding the generation and disposition of power should take precedence over all other instructions. Important messages should always be repeated.

The question of proper discipline is an important matter, and the morale of the men, as well as the condition of the equipment under their care, should have special consideration. All concerned should understand that co-operation with the system operator tends toward safe, continuous and efficient work.

Book Reviews

THE ELECTRIC VEHICLE HANDBOOK. Fifth annual edition. By Frank W. Smith and H. C. Cushing, Jr. New York: H. C. Cushing, Jr. 388 pages, 200 illustrations. Price, \$2.

In bringing this new edition of "The Electric Vehicle Handbook" up to date the authors have had the assistance of William P. Kennedy, consulting transportation engineer, together with the best-known experts in the country on the practical operation and care of the electric vehicle, its storage batteries, motors and accessories. Thomas A. Edison is quoted as saying: "We have needed just the information contained in its pages." It is the only book on the subject published and has proved a valuable reference work for the owner or operator of an electric vehicle of any class.

THE MYSTERY OF MATTER AND ENERGY. By Dr. Albert C. Crehore. New York: D. Van Nostrand Company. 162 pages, illustrated. Price, \$1.

A fascinating little volume, designed to stimulate interest and inquiry in the physics of the microcosm. We human beings live in a world of dimensions capable of directly appealing to our senses. Exactly what these dimensions are is naturally a debatable question; but let us state it as ranging from, say, a millimeter up to

say a few megameters, or through a ratio of about 10^{10} , with a geometric mean at 100 meters. Outside of this immediate world astronomy opens up a vastly greater or megacosmic universe, commencing say at 10^{10} meters and running up to what outer limit we know not, but up to discussed limits of 10^{20} meters, another range of 10^{10} meters, with a geometric mean at 10^{15} meters, or roughly 0.1 light-year. Inside of our immediate world, physics opens up a vastly more minute or microcosmic universe, commencing, say, at 10^{-6} meter and working down to what inner limit we know not, but up to discussed limits of 10^{-16} meter, another range of 10^{10} , with a geometric mean at 10^{-11} meter, a distance suitable for discussing electronic orbits. At the present time, physicists are much engaged in unraveling the mysteries of the microcosmic universe. They seem to be as wonderful as those of the megacosmic or stellar universe. The ultimate laws of matter, gravitation and radiation are intimately connected with the microcosmic world. It may well happen, indeed, that the ultimate conditions of the planets in the stellar universe may be worked out from discoveries yet to be made in the microcosmic universe. The book is written without algebra, but it contains some beautiful geometrical drawings and atomic-model pictures. The volume is to be recommended to all educated persons possessing some general knowledge of physics who are interested in the most recent investigations within the microcosmic world.

THE THEORY OF THE SUBMARINE TELEGRAPH AND TELEPHONE CABLE. By H. W. Malcolm. London, England: The Electrician Printing & Publishing Company, Ltd. 566 pages, 198 illustrations. Price, 18s.

This is a good textbook on the mathematical theory of submarine-cable telegraphy and telephony. It divides itself into two portions or groups of chapters, namely, (1) those which deal with the theory of steady-state simple alternating-current transmission over cables, and (2) those which deal with the theory of transients or arrival curves on such cables. The former theory is not new, having been developed by other writers in the past. The latter theory is new in its development. It was merely outlined by Kelvin and Heaviside. This book makes, therefore, a valuable and much needed contribution to the knowledge of the transient or unsteady state in submarine cables, whereby the arrival curves may be computed under any assigned set of ordinary signaling conditions at the sending and receiving ends. The chapters relate to the following subjects: Mathematical recapitulation, fundamental cable constants, transient and periodic phenomena, the telegraphic equation and its periodic solution, the methods of loading cables, discontinuities and reflections, alternating-current measurements, the telegraphic equation and its transient solution, the part played by signaling apparatus, sending phenomena and the influence of leaks, signaling by inverse currents, sine-wave transmission, distortion and how it is produced, present-day methods of overcoming distortion, the duplexed cable, and the loaded telegraph cable. The volume will be of great value as a reference book to cable telegraphists and to students of electric signaling who have had a good mathematical training.

STATION & OPERATING PRACTICE

A Department Devoted to Problems of Installation, Operation and Maintenance of Equipment for Economical Generation and Distribution of Electrical Energy

THE COST OF INSTALLING UNDERGROUND CONSTRUCTION

Compilation of Expenditure for Average-Sized Conduits Which Should Enable Engineers to Estimate the Cost of Construction Approximately

The following data giving construction costs for an average-sized conduit have been compiled by the National Fireproofing Company of Pittsburgh, Pa. In computing these costs certain basic figures (Table I) were used which will naturally vary in different localities.

TABLE I—BASIS COSTS USED IN CALCULATING COSTS OF UNDERGROUND CONSTRUCTION

	Cost Per Cu. Yd.
Excavating trench	\$0.70
Back-filling trench	0.25
Laying conduit	0.0075*
Mixing and wheeling concrete.....	0.70
Removing surplus dirt.....	1.60
Cost of aggregate for concrete.....	1.53†
Cost of cement.....	0.002*

*Per duct foot.

†Per barrel delivered.

So much conduit is run in suburban and cross-country districts where there is no pavement to replace, as well as under streets previous to paving them, that the cost of replacing pavement does not always have to be considered. When it is necessary to remove and replace pavements, however, the average cost thereof can be found in Table II.

TABLE II—COST OF REPLACING DIFFERENT KINDS OF PAVEMENTS

	Cost Per Duct Foot
Granite block on sand.....	\$0.0147
Brick on sand.....	0.0147
Brick on concrete.....	0.0294
Asphalt on concrete.....	0.0441
Cement sidewalk	0.0147

The figures shown in Table III may be used safely in approximating the cost of materials and labor for brick manholes having concrete floors, sewer connection, reinforced-concrete top and cast-iron frame and cover.

TABLE III—COST OF BRICK MANHOLES*

Number of Ducts	INSIDE DIMENSIONS (FT.)			AVERAGE COST		
	Length	Width	Height	Labor	Material	Total
1 to 3.....	5	3½	4	\$24	\$32	\$56
4 to 8.....	5	3½	5	26	36	62
9 to 12.....	6	4	6	35	45	80
13 to 24.....	7	5	6	45	54	99

*For concrete manholes approximately 25 per cent less than the above values should be estimated.

The following schedule of costs is compiled to serve as a guide in making up of estimates only and is such as will cover average conditions in any district of a city. These figures include cost of all materials (the duct excepted), excavating, removing dirt, mixing and placing concrete, hauling and laying duct, replacing pavement and the expense of city inspection. The

TABLE IV—AVERAGE COST PER DUCT FOOT UNDER DIFFERENT PAVEMENTS

Number of Ducts in Trench	Grass Plot or Unpaved Street	Macadam, Cobble or Wood Block on Sand	Wood Block on Concrete	Asphalt, Grouted Brick or Granite Block on Concrete
2	\$0.150	\$0.180	\$0.250	\$0.300
3	0.120	0.134	0.165	0.200
4	0.090	0.100	0.133	0.160
6	0.070	0.079	0.110	0.120
8	0.060	0.066	0.098	0.110
9	0.055	0.062	0.094	0.105
10	0.053	0.059	0.090	0.102
12	0.050	0.055	0.085	0.096
14	0.047	0.052	0.081	0.092
16	0.044	0.048	0.077	0.088
18	0.042	0.046	0.074	0.085
20	0.040	0.044	0.071	0.082
22	0.039	0.042	0.069	0.080
24	0.038	0.041	0.066	0.078
26	0.037	0.040	0.065	0.076
28	0.036	0.039	0.064	0.075
30	0.035	0.038	0.062	0.074
48	0.032	0.036	0.060	0.071

figures are based on the supposition that the duct line is surrounded with 3 in. (7.6 cm.) of concrete and that the top of the ducts is placed 24 in. (0.6 m.) beneath the pavement surface.

USE OF METERING EQUIPMENT SAVES TRANSFORMER PURCHASE

Rearrangement of Equipment in Distribution System Made Possible by Careful Measurements Eliminates Immediate Expenditure

Striving toward conservation of essential materials in accord with the spirit of the times, the Plymouth (Ind.) Electric Light & Power Company recently worked out a scheme for utilizing existing transformers more efficiently and thus avoided purchasing additional units. In general the plan consisted simply of making load measurements on certain transformers to ascertain what units could be relocated to better advantage as regards their capacities. The apparatus used in making the measurements consisted of two sets of current transformers and one graphic meter. One set of transformers were rated at 160/5 amp., 2500 volts each, and the other at 20/5 amp., 2500 volts each. The meter was a Westinghouse type U, with an eight-day clock and

a 5-amp. scale. This equipment was all placed in a single box in such fashion that several desirable circuit changes could be made on a plug board constructed as a part of the outfit. These circuit combinations made it possible to use the metering outfit and get proper scale deflections on the meter on transformers between 10 kw. and 60 kw. A two to one ratio instrument transformer was used on smaller units.

When a test was made the metering outfit was hung on a pole at the transformer bank. In residential districts the duration of these tests was usually from Monday until Thursday and in the business districts was usually from Friday until Monday. On motor installations records over a two-week period were sometimes taken.

As the result of forty such tests the locations of ten transformers were changed. In general it was found that units in residential districts could serve wider territory and thus release transformers to be removed to the business district, where most of the existing equipment was overloaded. Making the changes which were indicated to be possible by the tests has relieved the company for the time being of the necessity of buying transformers and has bettered the voltage regulation of the system as a whole.

HINTS FOR LINE FOREMEN IN CASE OF ACCIDENTS

Method of Procedure When Accidents Occur to
Men—Two Essentials Must Be Looked to
Promptly—Keeping Cool

The most soul-trying time that comes in connection with the duties of a line foreman is the time when from one cause or another one of his men receives a fatal or dangerous electric shock or burn. Under the stress of such a situation, particularly if the victim is suspended on his safety belt or lying across a high-tension line, many men go to pieces or at least become so excited that no concerted action may be expected. When such an occurrence takes place two essentials should be looked to promptly:

1. The injured man must be brought to the ground as speedily as possible and artificial respiration commenced at once.

2. No time should be lost in summoning medical aid and the company's resuscitating device.

The first of these must be left to the foreman to handle as he may, but he should be relieved of all responsibility regarding the second. This may be accomplished by detailing either the driver or one of the groundmen to reach for the nearest telephone and start the machinery in motion which will bring aid to the scene. The driver is the logical man for this work and should have it regularly impressed on him that this is his "bit" in such an event. By impressing on the men the part they are to play in event of accident the natural confusion will be reduced to a minimum.

Rules for the protection of electrical workmen may be multiplied indefinitely to good effect, but the gospel of accident prevention will be best promoted by instilling into the minds of the men the fact that they are dealing with a force so destructive and rapid in its action that no stone will be left unturned to add to their safety while working with it and that no amount of protective

apparatus will effect its mission unless accompanied by an intelligent and careful co-operation on their part.

The above considerations were brought out by W. C. Pearce, superintendent electrical department Syracuse (N. Y.) Lighting Company, in a paper read at the recent meeting of the National Safety Council.

METHOD USED IN BOSTON TO CONSTRUCT LATERALS

Underground Laterals Are Installed to Care Only
for Services Which Are Definitely Contem-
plated, Thus Avoiding Useless Construction

The policy followed by the Edison Electric Illuminating Company in constructing underground lateral lines and manholes connected with the main line was outlined recently before the Massachusetts Gas and Electric Light Commission by L. L. Elden, electrical superintendent of the company.

The policy that is carried out is to lay such structures to take care of business of which the company has knowledge at the moment, instead of attempting to build for the future development of particular districts. Some years ago the company attempted to lay down laterals in a Boston development where two or three streets had not been accepted, installing ducts to the lot line upon the assurance of property owners that houses were going to be built. About fifty spare ducts were put in, but the plan was unsatisfactory on account of the irregular and uncertain development. In some cases a purchaser would buy two adjoining lots, erecting a house in the middle of the parcel thus obtained and so throwing one service duct out of usefulness, to say nothing of introducing a change in the symmetry of the feed location. In another case a driveway was built in a location which made the lateral useless.

On account of these uncertainties the Boston company now builds only for immediate business. When the city lays out a new underground district the sales force canvasses every house in the region. If the company secures the business in some new locations it installs the pipes, but otherwise no spare pipes go in. At least 25 per cent of all Boston Edison manholes have been built after construction of the main lines of conduit.

FAN ENGINE MOUNTING

Engine Is Mounted in Turbine Room, Affording a
Compact Arrangement

At the Farmingdale station of the Central Maine Power Company a fan engine connected with the boiler draft supply is mounted in the turbine room on a reinforced concrete platform, instead of being placed in the boiler room proper, as is generally the case. The platform is carried about 10 ft. (3 m.) above the floor, and, in addition to providing turbine room supervision for the engine, enables the outfit to be operated in space of little use for other purposes. A short connection with flange coupling runs through the wall between turbine and boiler rooms and a secondary platform above the base of the engine with appropriate ladder connection enables the cylinder and valves to be inspected with ease. The arrangement is compact and affords maximum cleanliness of operation.

Topics, Including Applications of Electric
Light, Power and Heat

THE CREDIT DEPARTMENT'S RELATIONS WITH CUSTOMERS

**Courteous, Firm and Painsstaking Methods Used to
Collect the Past-Due Accounts, with Service
Discontinued Only as Last Resort**

There are many ways of collecting accounts. Methods employed by some companies irritate and antagonize customers. Other methods create respect. In some instances collection departments set out with the avowed intention of creating a reputation for harshly handling customers in order that the customers' fear of such handling shall assist in reducing a number of overdue accounts. Some utilities have been known to go so far as intentionally to attract the attention of the delinquent's neighbors to the fact that trouble is ensuing over the payment of a bill. In general, however, this is not the accepted plan among more progressive central stations. Their plan generally is to adopt systematic, thorough and painsstaking but withal firm measures of insisting upon payment. It is the endeavor to cultivate the good will of the customer rather than to antagonize him.

METHODS OF A MIDDLE WEST COMPANY

As characteristic of these practices the following description of methods employed by the credit manager of a Middle Western electric lighting utility is of interest: This collection system requires the rendering of three statements on all delinquent accounts, namely, the memorandum of arrears, the collector's statement and the "Important" statement. Formerly these statements were printed on addressographs from stencils used for printing the bills and were filled in by long-hand by statement clerks. Recently, however, the department has adopted a very modern system of rendering these statements through the use of four Underwood-type fanfold statement machines. The operation is now so handled that six copies are made in one operation, namely, memorandum of arrears, cashier's stub of memorandum, "Important" statement, cashier's stub of "Important" statement, collector's statement, office copy of collector's statement.

When an account is ten days past due—that is, twenty days after the bill has been rendered—the company sends the customer by mail the memorandum of arrears, in which is printed the following paragraph:

"Please note that bills listed above have not been paid. As same are past due, the favor of your remittance by return mail is requested."

This statement usually brings payment from customers who have misplaced or neglected their bills. To those who pay no attention to it, it is necessary to render the collector's statement. This is sent out ten days after the memorandum of arrears statement was

mailed. The collector's statement is made in duplicate, one copy being for the collector and one for the office records. It constitutes the first call statement and is the beginning of the collection department's intimate relations with the customer. If the collector is not successful in securing the money on the first call, he leaves a collector's first notice, which shows the amount due and reads as follows:

"Your attention is called to your past due and unpaid account for electricity amounting to \$—, covering dates for electrical merchandise \$—, electric wiring \$—. Please remit or call at our office and make payment without delay."

Five days later, if no collection has been made, the "Important" statement is mailed. This bears a shut-off notice reading as follows:

"We beg to draw your attention to your past-due account as listed above. We request that this account be paid before the close of business on —. Otherwise we shall be obliged, with regret, to enforce our rule relative to discontinuing service."

After allowing three days for the customer to make payment the collector makes his second call to collect or discontinue service. He must, however, interview the customer and get his refusal to pay before service is discontinued. In the event that the customer is not at home he will not shut off the service, but will leave a final shut-off notice which reads as follows:

"We beg to advise that, in accordance with notice sent you for your unpaid account for electricity amounting to \$—, call has been made to-day to shut off service. We hope you will render this action unnecessary by paying bill at once at the main office."

THE THIRD AND LAST CALL

This means that the third call must be made if the customer does not remit. On the third call the customer must pay or service will be discontinued. If conditions are such that the collector cannot reach the meter, the case is turned over to the repair department to collect account or to discontinue service if necessary at the pole. Before this action is taken, however, a letter is addressed to the customer informing him that such action will be taken if the account is not paid. In the event that the service is shut off the collector leaves a slip at the meter showing the amount of the overdue account which was the cause of discontinuing service. Upon the payment of this account the customer can have the service reconnected the same day it is discontinued.

As these various steps are taken memoranda are made on the customer's account at the office so that any inquiry as to the status of his account may be answered.

After service has been discontinued for non-payment

the report is held fifteen days, during which time another call is made to collect the account if possible. If the account is not paid, the contract department is informed of the situation and requested to issue an order to have the meter removed.

DEALING WITH CUSTOMERS WHO HAVE MOVED

The next task of the collection department is to get the money on the final accounts of customers who have moved or whose meters were removed on account of non-payment.

First in order, there is the case of the customer who has moved and is using service at another address. If the balance owed is less than \$1.50, the amount is added to his bill, which will be sent to the new address. If the amount is more than \$1.50, it is given to a collector. If he does not secure the balance, he will leave a notice for the customer. If the customer then does not remit within ten days, another letter is sent requesting payment. Ten days later, if the account has not been paid, a shut-off notice letter is mailed stating that service will be discontinued within three days.

Second, there is the case of the customer owing a final account who gave the company his new address at the time he ordered service discontinued but who is not using service at the new address. The collector calls upon this man and, if he cannot collect the amount, leaves a notice that the balance is due. If payment is not made within ten days, two letters are written at intervals of ten days requesting payment. If remittance is not made then, the collector makes another call. If he is unable then to collect the amount or to get satisfactory promise of payment, credit data are referred to.

If the correct business address of the customer is shown in the credit data, a call is made at this address and then a letter is sent to the business address stating that the account will be sent to an attorney for payment if it is not settled. After this a few more calls are made by the collector to establish definitely the fact that it is impossible to get the money. Then the account is turned over to the company's attorney with all of the collector's reports, copies of letters, credit data, etc. A card is also filed in the credit department's suspense file to prevent the delinquent from securing further service from the company while his account remains unpaid.

Throughout all of these operations it is the intention of the department to exercise patience and to endeavor to cultivate the good will of the customer and at the same time to establish in the mind of the customer respect for the collection department.

UTILITIES REDUCING STOCK OF THE MATERIAL ON HAND

Economic Measure Which Conserves Both Labor and Capital for the Central Station Company, Besides Reducing Insurance Carried

There is at present a quite general movement among central-station companies to reduce the stock of material carried in the warehouses and storerooms. This movement is tending not only toward carrying a smaller quantity of supplies but also toward making use wherever possible of material on hand and the conversion

into money of all surplus material. Quite naturally, this movement carries with it also a corresponding reduction in the amount of insurance which will be carried.

Back of the movement is the desire to conserve capital and to conserve labor. Reducing stocks not only releases money actually tied up in the goods in the wareroom, when this material is used and is not replaced, but in many cases brings to light material which can be resold at present prices with a considerable profit.

This applies only to such material, of course, as is not likely to be needed in the near future. In some instances the stock reductions have been of such extent as to justify reducing the amount of insurance carried, which also effects a saving. With the reduction of stocks carried it is also possible to effect a saving in the amount of labor necessary to handle the stock and in the amount of labor required in taking inventory, two considerations of importance.

METHOD FOR SAVING TIME IN THE FILING OF VOUCHERS

Manila Envelopes Provided for Filing, with Provision for All Account Titles and Numbers, Amounts and Totals

The Agawam (Mass.) Electric Company and affiliated central stations, under the management of the Cabot interests of Boston, file vouchers most conveniently by making use of a method which is described in the following paragraphs:

Vouchers are properly classified under account numbers and are then kept in manila envelopes about

FACE OF THE ENVELOPE FOR FILING VOUCHERS WHICH IS USED BY A MASSACHUSETTS CENTRAL STATION

9 in. by 11½ in. (22.8 cm. by 29.2 cm.) in dimensions, the face of each envelope carrying all account titles and numbers, with space for amounts and totals under each class, as shown in the illustration which accompanies this article.

Provision is also made for approval signatures, and a record of the check number paying the account and other information can be inscribed in the open spaces which are left on the envelope to serve the convenience of the office.

TECHNICAL THEORY & PRACTICE

Including a Digest of Important Articles Appearing in
the Scientific and Engineering Press
of the World

Lamps and Lighting

An Indirect Lighting System in a Textile Plant.—GEORGE WRIGLEY.—For obvious reasons it is frequently desirable in lighting industrial plants to use a small number of large units rather than many small units, provided that uniform illumination without excessive glare can be obtained. With direct lighting reflectors the size of unit is limited by such physical features as ceiling height and machinery spacing. This paper describes a system embodying the use of the largest approved size high-efficiency incandescent lighting unit, arranged to give the best possible working conditions for the operatives.—*Illuminating Engineering Society.*

Effective Lighting of Factories as Judged by Daylight Standards.—WARD HARRISON.—The author points out that because of the high power and concentration of present light sources greater care must be taken in selection of diffusing accessories to minimize glare and specular reflection, to provide a directed light of ample intensity on both horizontal and vertical surfaces, and to give soft shadows. Consideration is given to the limiting brightness values governing the choice of equipment for different classes of factory lighting. The common forms of factory units are compared as to fulfillment of lighting requirements. In this connection a new diffusing unit, consisting of a large porcelain steel reflector of special design in combination with a silvered lamp cap, is described. Tests of actual working daylight intensities in a number of workshops are reported. Results of an investigation of factory rental costs are shown, and the marked savings in production cost through double-shift operation feasible with artificial lighting of a daylight standard are calculated.—*Transactions I. E. S.*, Nov. 20, 1917.

Generation, Transmission and Distribution

Plans for Long-Distance Transmission.—F. NIETHAMMER.—In the course of an article on the development of a hypothetical electric-service system covering an entire country with its branch stations and 100,000-volt transmission lines the author mentions some interesting figures concerning Germany's consumption of electrical energy in 1916. From 2,600 000,000 kw.-hr. in 1913 the consumption jumped to more than 10,000,000,000 kw.-hr. in 1916, or practically four times as much. The enormous value of hydroelectric power has been impressed upon Austria and Germany, and plans are already under way for the utilization of all the swift mountain currents and waterfalls in the Austrian Alps for manufacturing purposes. Within the next quarter of a century Germany plans completely to electrify its railways and to erect central generating stations, using water power and the vast fields of turf and bituminous coal. All machinery is to be driven electrically, all lights and all heating in cities to be by electricity. Pre-

liminary surveys and plans are already under way.—*Elektrotechnik und Maschinenbau*, Nov. 11, 1917.

Traction

Voltage Rises in Third-Rail Circuits.—D. D. EWING.—A study of the causes of high-voltage rises in third-rail systems is presented in this article, together with oscillograms of such surges. Rises in voltage of two or three times the normal were found possible.—*Electric Railway Journal*, Dec. 15, 1917.

Tramways Render Invaluable Service in Halifax Disaster.—The tramway company at Halifax, N. S., came through the recent disaster with loss of few employees and comparatively little damage to power plant, track and rolling stock. Its speedy resumption of operation was of great assistance in the work of recovery.—*Electric Railway Journal*, Dec. 15, 1917.

Electric Traction in Italy.—A reprint from the report of a parliamentary commission of inquiry into the state railways of Italy, the use of electricity on which dates from 1900, when two systems were inaugurated—one on the Valtellinesi railroad, in the Adriatic district, where three-phase alternating current was used, and one on the Milan-Varese railroad, in the Mediterranean district, where direct current and the third-rail were employed. The former system now has 276.9 km. (172 miles) of single track and 113.7 km. (70.6 miles) of double track, and the latter system has 58.5 km. (36.3 miles) of double track, or a total for the two systems of 449.1 km. (279 miles) electrified. An elaborate table of cost of operation per kilometer as compared with the cost of operation by steam locomotives is included in the article.—*L'Elettrotecnica*, Nov. 15, 1917.

Installations, Systems and Appliances

Mechanically Operated Furnaces.—M. LAMOTTE.—The ever-growing cost of coal makes the utility of mechanically operated furnaces as compared with hand-operated ones a matter of prime importance. Even the most nearly perfect furnaces will differ from 15 to 20 per cent in the amount of fuel consumed when controlled by different firemen. The author takes up the questions of automatic draft and of mechanical feeding and stoking, considering in turn the various forms of apparatus devised for these purposes, the underfeed and endless-chain grates, etc., of different makes. To a questionnaire responded to by twenty establishments widely varying answers were received. One firm, for instance, puts the maintenance cost—material and labor—per grate per hour of operation with one system at nearly seven times, and with another system at nearly eighteen times, the figures reported by another firm for the system used by it. Similarly, the high-estimate firm puts the cost of operation per grate at six times the sum reported by the low-estimate firm.

The amount of fuel consumed by the same furnace in different establishments also varies, according to the reports, by as much as 100 per cent, depending evidently on the quality of the coal and the strength of the draft. In the presence of such divergences, the author says, further experience is necessary before exact conclusions can be drawn.—*Revue Générale de l'Electricité*, Nov. 10, 1917.

Methods for More Efficiently Utilizing Our Fuel Resources.—H. G. BARNHURST.—This article, the seventh of a series on the general utilization of pulverized coal, briefly reviews the extent of the use of pulverized coal in the Portland cement industry and then treats of its later application in other industries. It is being used more and more extensively in metal-heating furnaces, in metallurgical furnaces in the steel and copper industries, and for burning lime and dolomite for making furnace refractories. A field in which enormous quantities of this fuel will be used is in the generation of power in stationary power plants. The article refers to many low-grade solid fuels which can be utilized with good results in pulverized form, and states that the danger incident to the use of pulverized coal has been greatly exaggerated. The preparation and handling of pulverized fuel are discussed in detail in the latter part of the article.—*General Electric Review*, December, 1917.

Electrophysics and Magnetism

Faraday Society Symposium on Pyrometers and Pyrometry.—At a meeting of the Faraday Society held in London Nov. 7, 1917, the general subject of pyrometers and pyrometry was considered in its relation to metallurgy. The first paper, by E. F. Northrup, dealt with the "Production of High Temperature and Its Measurements." The author pointed out that the refractory properties of carbon offer means of obtaining high temperatures, the upper limit of which is the vaporization temperature of that element. The writer presented results of two inquiries—first, what form would an ideal furnace take? second, is it physically possible to reach this ideal electrically? The progress of electric heating is also outlined, as is the measurement of high temperature. The author urges all investigators in the field of high temperature to consider the great possibilities of the metal tin for extending the fundamental temperature scale above 1550 deg. C., the present limit of the gas thermometer. The subject of "Pyrometer Standardization" was discussed by Ezer Griffiths and F. H. Schofield of the National Physical Laboratory. The authors pointed out that it is now generally agreed that the standard scale of temperature should be the thermodynamic. The third paper was presented by Richard P. Brown on the "Automatic Control and Measurement of High Temperatures." The author showed the industrial need for automatic temperature control and the feeling of security that comes to a factory manager whose plant is thus equipped. The principles of a new heat meter developed by the writer are outlined, as are the details of an instrument to control furnace temperatures automatically.—*Metallurgical and Chemical Engineering*, Dec. 15, 1917.

Flux of Energy in Electrodynamical Field.—G. H. LIVENS.—The basis of the theory of energy streaming in the general electromagnetic field is briefly reviewed and the most general form of Poynting's and Macdon-

ald's results is obtained. In addition, Macdonald's own form and an alternative are deduced, and although reasons are given for their rejection in favor of the simpler and more general type of theory first obtained, the former (Macdonald's own form) is retained throughout the succeeding discussion for purpose of illustration. The various theories are then subjected to critical examination on general grounds and subsequently in reference to their behavior in certain special fields, and it is shown that in the present state of our knowledge any alternative to Poynting's theory must be rejected as being wholly incompatible with our physical conceptions of energy and its streaming in the electromagnetic field.—*Philosophical Magazine and Journal of Science*, November, 1917.

Some Fundamental Concepts of Electrical Theory.—H. BATEMAN.—The author develops an electromagnetic theory based on the idea of moving lines of electric force, discussing it from three viewpoints: (1) Permanent and mutual incidence of the lines of force of the different point charges; (2) temporary incidence of lines of force of different point charges but no cutting of lines of force; (3) motion in which the lines of force can cut right through one another.—*Philosophical Magazine and Journal of Science*, November, 1917.

Units, Measurements and Instruments

Measurement of Self and Mutual Inductances.—FRED E. PERNOT.—The author describes a mill method of measuring self and mutual inductances by comparison with known values of resistance and capacity.—*University of California Publications*, No. 12, Vol. 2.

Conductivity of Aluminum.—GUIDO GRASSI.—Results of an examination made to determine the conductivity at diverse temperatures of various samples of aluminum wire as a contribution to the knowledge of the electrical constants of aluminum. Three groups of wires were experimented with, a chemical analysis producing the following results:

	Al.	Fe.	St.	C.	Cu.	Na.	Pb.
I	98.31	1.13	0.50	0.038	Trace	0.013	Trace
II	98.61	1.00	0.36	0.012	Trace	0.011	Trace
III	98.32	1.23	0.38	0.043	Trace	0.019	Trace

The tests were made by the methods of Hockin and Matthiessen, a potentiometer being also employed in one instance, and the fact was established that the increase in the resistance of aluminum from 0 deg. to 100 deg. is proportional to the increase of the temperature. Therefore, the resistance R at temperature t may be expressed: $R = R_0 (1 + \alpha_t t)$, where R_0 is the resistance at 0 deg. and α_t is the coefficient of the temperature referred to 0 deg. Group II showed less resistivity than the other two groups, although it was the richest in aluminum.—*L'Ettrotecnica*, Oct. 25, 1917.

Telegraphy, Telephony and Signals

Private Automatic Telephone Systems.—A description of a telephone system for direct intercommunication by means of automatic plugs. Because of its reliable operation and small expense this system is adapted to the needs of small plants containing fewer than twenty-five instruments, where switchboards or elaborate automatic systems cannot economically be installed. The chief drawback is the ease with which a third party may "listen in" unknown to the conversers.—*Revue Générale de Electricité*, Nov. 24, 1917.

NEWS OF THE INDUSTRY

Chronicle of Important Events and General Activities
in the Technical, Commercial and
Manufacturing Fields

WAR-TIME MEETING IN SOUTHERN CALIFORNIA

Annual Gathering of District Agents and Department Heads, with Earnest Discussion of Problems Under War Conditions

In the spirit of harmonious co-operation to effect every possible economy which will not impair efficiency of service, more than 150 officers, department heads and district agents of the Southern California Edison Company met at the Hotel Alexandria, Los Angeles, on Dec. 27 and earnestly discussed the conditions which confront this important public utility under the war conditions of the times.

In a spirit of optimism and cheerful compliance, with perfect comprehension of what is required and of the individual duty and collective responsibility which war imposes upon those engaged in the quasi-public service, present problems were discussed and those of the future anticipated.

THE COMPANY'S ATTITUDE TERSELY PHRASED

These excerpts from addresses pertinently express the attitude of the company. Vice-president R. H. Ballard said: "The California State Railroad Commission has indorsed this program, and our program will be, 'Do the things that are necessary and let convenience take care of itself after the war.'"

Superintendent of Sales A. W. Childs voiced this epigram: "Unfolding opportunity is the wonder of the electrical industry—the harvest is always being gathered and yet it is always waiting in greater abundance."

The program of papers and addresses was as follows: "Cutting Stationery Costs," R. E. Herman, chief of the stationery department; "Advantages of County District Lighting," W. M. McKnight, agent of the Redondo district; "How the Medical Department May Help Employees," Dr. H. C. Stinchfield, chief surgeon; "Conserving Time," W. L. Frost, assistant general agent; "Utility of the Electric Water Heater," P. J. Denninger, agent for the Whittier district; "Safeguarding the Kilowatt-Hours," H. A. Barry, electrical and mechanical engineer; "Intensive Development of Existing Circuits," A. W. Childs, superintendent of sales; "How Some Expenses Can Be Reduced," D. M. Trott, assistant comptroller; "Why the Light-Weight Car Is Advocated," P. H. Ducker, superintendent of transportation; "Shots at Sundry Targets," S. M. Kennedy, general agent; "Big Creek Hydroelectric Development," E. R. Davis, general superintendent of the northern division; "On the Threshold of 1918," R. H. Ballard, vice-president and assistant general manager.

Of the suggestions for economies and increased efficiency these were emphasized: The imperative duty

of each employee being productively employed for every moment of the working day; the economic crime of **wasting** time in personal conversation during business hours; saving in stenographers' time by making letters shorter, omitting salutation in inter-company correspondence; single-spacing and using short letterheads; making letters take the place of trips from districts to general offices and from general offices to districts; using trolleys instead of automobiles whenever possible and practicable; revising the entire system of forms and blanks and cutting out all that are not positively essential; saving in every little detail, down to doing away with envelopes for inter-company mail and even to the use of holders for the short ends of lead pencils.

LARGE INSTALLATIONS IN 1917

Of the work of intensifying the business under existing lines two of the most important features reported were installations of electric ranges and electric water heaters. The Southern California Edison Company now outranks all other electric companies in these installations, having with the close of the year on its own territory and that of its subsidiary companies, all interconnected, 2867 ranges and 603 water heaters, having sold 1390 ranges and 478 water heaters during 1917. It was intimated that future extensions would necessarily be along very conservative lines, and that in many instances the consumer would be given an opportunity, through deposits, to help the company help him obtain the service desired.

How the "Greater Edison Company," which since its merger with the Pacific Light & Power Corporation last May distributes electricity in a domain geographically equal to Massachusetts, New Hampshire, Vermont, Connecticut, Rhode Island, Delaware and New Jersey, can best serve its consumers, safeguard its investors and do its full patriotic duty by the government, were the big problems for the coming year touched upon by Vice-president Ballard. To conserve fuel by making every drop of available water power do its work, to keep the wheels of manufacture turning, to economize without injuring, to be efficient without increasing investments and see that the money invested for that purpose was not deprived of its income, were set forth as the tasks for 1918.

KEEN INTEREST IN EVIDENCE

The meeting was characterized throughout by an intense amount of interest from those in attendance, and the able discussion of the papers and questions asked clearly indicated a keen desire on the part of the men from all parts of the company's system not only to carry out the economies planned but to suggest other directions where more economies could be either worked locally or applied to all districts.

ACROSS THE FACE OF THE GREAT WHITE WAY OF NEW YORK CITY "ICHABOD" WILL BE WRITTEN. ITS GLORY HAS DEPARTED

RIGID "LIGHTLESS" ORDER MADE FOR NEW YORK STATE

Only on Saturday Nights Will Lighting Be Permitted in Accordance with the Federal Restrictions

A new order, making every night but Saturday "lightless" in New York State, has been issued by Albert H. Wiggin, Federal Fuel Administrator for that State. This order is the outcome of the controversy over the continued illumination of electric signs in its relation to fuel scarcity and war economy, and it followed a less sweeping order previously issued.

Mr. Wiggin and his organization are studying the fuel situation through a conservation committee on fuel. An advisory committee on fuel has been appointed representing the light, heat and power companies. It is composed of L. B. Gawtry, Consolidated Gas Company, New York; F. W. Smith, United Electric Light & Power Company, and Mr. Gillam, New York Steam Company.

The new regulative order of Mr. Wiggin, effective in New York State, follows:

By virtue of powers conferred upon me, I hereby issue the following orders, to take effect Jan. 2, 1918:

1. On Saturday nights lighting is permitted, subject to the restrictions imposed by order of the United States Fuel Administration, dated Nov. 9, 1917, and order of the undersigned, dated Dec. 8, 1917.

2. On all other nights all signs of every kind, including merchants' signs, signs for theaters and all other places of entertainment, display signs, lighting on buildings and

elsewhere, hotels and advertising signs, are ordered to discontinue completely.

3. Stores and offices and commercial buildings not open for business shall not use inside lights more than absolutely necessary for safety. Cluster lights and illuminations generally must be reduced to only so much lighting as is necessary for safety.

4. No more outdoor lighting shall be used than is absolutely necessary for safety of streets, passages, dangerous places and protection of the public, or as may be required by law.

5. No person, partnership, corporation or association furnishing electricity or gas or using the same shall use any coal, oil or gas or other fuel for supplying of electricity or gas, excepting subject to the restrictions and conditions contained in this order.

6. County administrators are directed promptly and strictly to enforce this order.

Harry T. Peters, chairman of the fuel conservation committee which is studying conditions for the Fuel Administration in New York, has made public the preliminary results of a survey of the amount of coal held by public service corporations. He found that in most cases unprecedented inroads were made into their reserves in December.

Mr. Peters pointed out that many thousand persons are dependent upon these companies for light and heat and millions for transportation, and expressed the opinion that any attempt to commandeer their already depleted reserves would be a serious mistake. On the contrary, Mr. Peters urged fuel administrators to devote every effort to maintaining the supply of these corporations, and said failure to do so would amount to criminal negligence.

GOVERNMENT REQUISITIONS THE NIAGARA ENERGY SUPPLY

Federal Authorities Take Absolute Control of Production So as to Assure Distribution in Accord with Essential War Needs

To protect the power supply for war industries the federal government requisitioned on Dec. 28 the energy produced, imported and distributed by the Niagara Falls Power Company, Hydraulic Power Company and Cliff Electrical Distributing Company.

A determining factor in the government decision, Washington reports say, was the demand of Canadian authorities that approximately 100,000 hp. imported from Canada be used exclusively for war work.

Statements given out in Washington indicate that it is not expected that operation of manufacturing establishments will be affected materially, as a partial redistribution of the power supply had already been arranged between the War Industries Board and Buffalo manufacturers.

About 110 manufacturers not working directly on war contracts will curtail their requirements to some extent, will use power at hours when munitions factories make minimum demands and will substitute steam for electricity as much as possible.

SHORT COAL RATIONS IN THE OHIO PLANTS

Effect of Coal Pooling Plan Noted at Toledo—Stations at Various Points Obligated to Curtail Service

While a little improvement in the coal situation in Ohio has been noted during the last week, it is still acute. There are hopes of a better supply through the government control of railroads and the coal pools established in the State recently. In Toledo the effect of the pooling plan has been noted already, but sufficient time has not elapsed for a material change at other points.

The Springfield Light, Heat & Power Company on Dec. 28 had a supply of coal that would last until Jan. 1. Some large factories announced that they would have to close at the end of last week if supplies were not secured.

Chillicothe reports indicate that the light and power station has not had more than one car of coal at a time for several days. Domestic coal is very short and some suffering is reported.

The Northern Ohio Traction & Light Company, Akron, on Dec. 28 had a three-day supply of coal, with slight prospects of securing more in time to prevent inconvenience. This company has exerted itself continually to buy coal wherever it could be had.

At Bowling Green the light station had only a small supply at the end of the week, and there was a possibility that energy would have to be discontinued at several factories.

For more than ten days the Ohio Utilities Company has discontinued service to power users at Delaware at 4.30 p.m. to save coal. It is said that coal receipts do not amount to more than half the needs.

The Findlay coal supply has been so short that light service was threatened several times in order that en-

ergy might be used to keep interurban cars in operation.

Difficulty has been encountered by the Ohio Electric Railway in securing fuel for its Lima plant, from which light and power service is furnished. Several streets and many residences have been in darkness as a consequence.

Only a few days' supply was reported at the municipal light plant in Wapakoneta the latter part of the week. The municipal plant at Lebanon is running only from 4 to 9 p.m., because of serious shortage.

The Cleveland Electric Illuminating Company and the municipal plant in Cleveland have supplies which will probably tide them over until further shipments are received.

While conditions at Columbus are serious, the Columbus Railway, Power & Light Company has a supply that will last until conditions clear up somewhat, it is believed.

Most interurban railways entering Cleveland either have suspended limited train service or will do so to conserve coal, as requested by the government.

COAL SITUATION IN KANSAS AND MISSOURI

Agreement Regarding Confiscation for Railroad Use—Cantonment Authorities Ask a Thirty-Day Surplus Supply of Coal

For the first time since the fuel administrators have had charge of the coal distribution in Kansas and Missouri there was reached on Dec. 22 a definite agreement between railroads, administrators and mine operators on the confiscation of coal for railways. It was agreed that where roads have to confiscate fuel it shall not be from the priority orders which are the emergency shipments from mines.

The situation in and around Kansas City is unique in that the Southwestern Coal Operators' Association is intrusted with the distribution of coal for the government, being first furnished with emergency orders by the administrators, who make a daily canvass through their county chairmen in the two states. In towns where dealers have coal it is ruled that no emergency exists.

Until recently some railways had confiscated coal for their own use from emergency orders. This has been stopped and all confiscated coal will be taken hereafter from other sources if railways find themselves short.

A new phase of the situation in Kansas and Missouri is that pertaining to the amount of surplus coal allowed various industries, including the government army cantonment at Camp Funston, Kan. Cantonment officers ask a thirty-day surplus, which, the Southwestern Coal Operators' Association believes, is far more than necessary and the cause of a great deal of suffering in many Kansas and Missouri towns and cities.

Priority orders give the cantonment preference, operators say, so there would be no danger of shortage there. But demand for a thirty-day surplus has called for much of the available railroad service and coal.

The operators in Kansas and Missouri, comprising the executive force carrying out the wishes of the fuel administrators, have enlisted aid of the administrators in trying to reduce the army's figures as to surplus. If they do not succeed they expect to appeal.

to Washington. Railroads leading from mining territories agreed to cut down their surplus demands.

Fuel conditions in the Southwest, which have been acute for several weeks, improved slightly in the last few days of December.

The opinion of electrical men and coal dealers in Kansas City is that the Fuel Administration "lightless night" order will be more successful if more stringent regulations are brought to bear upon the average citizen, who does not realize the importance of conservation. Companies using electric signs have been the first to observe fully the two lightless nights a week in Kansas City. They and the larger users of energy have co-operated fully with the Fuel Administration. Various small storekeepers, however, have not given full co-operation, and small users are not considering themselves as a part of the movement to conserve fuel.

It is estimated that the "lightless" nights have saved the Kansas City Light & Power Company 150 tons of coal per week. With a proper show of patriotism on the part of the public, the officials of this company say, the present arrangement will be sufficient. Otherwise more drastic action may be required by the administration to make the order successful.

ELECTRIC VEHICLE GROWTH UNDER THE CONDITIONS OF WAR

Steady Increase in Installations of Different Classes
in This Country and in Europe—
War Handicaps

BY A. JACKSON MARSHALL

Secretary Electric Vehicle Section, N. E. L. A.

Along with other resources, the electric vehicle has been drafted to do its part in "making the world safe for democracy." It has been estimated that approximately \$36,000,000 was invested in electric commercial vehicles at the end of the year 1916.

Where England had but 150 electric trucks a little over three years ago, to-day about 1000 are in operation and many more are on order. Were it not for lack of transportation facilities these figures would be considerably greater.

While the success of the electric commercial vehicle has been marked, the success of the little electric industrial truck has been even more so. Likewise in England we find a greatly increased use of electric passenger cars.

In Norway and Sweden vast electric vehicle developments are pending and already large installations have been made which are operating in a most satisfactory manner. Were it possible to freely obtain export permits and shipping facilities to these countries, great quantities of electric vehicles of all types would be purchased and installed.

In Italy the electric vehicle has more recently been recognized somewhat and plans are now being perfected whereby the electric power generated by waterfalls will be utilized extensively in supplying the propelling force for large numbers of electric vehicles.

In far-away Australia and New Zealand, in South Africa, Japan, Mexico, South America, Denmark, France, and, in fact, all over the world, electric vehicles are now being exported in increasing numbers.

In addition to this foreign business, existent and prospective, there is the constantly growing domestic

demand, which gives promise of even greater increases.

It is believed that even although we are confronted with unprecedented conditions which momentarily will throw out of balance usual modes of activity, the future holds vast possibilities for motor transportation and consequently the motor car industry will enjoy a success which will dwarf its present Aladdin-like growth. In this success the public will generously participate because of the improvements and economies which undoubtedly will be effected through the efficient mode of transportation which will come into being, and those concerns and individuals depending more or less on transportation for the success of their business would do well to promptly make plans to enjoy all the advantages which result from properly installed motor equipment. It would not be amiss to suggest that purchases of motor equipment be arranged for at the earliest time possible, for with the abnormal demands on motor manufacturing facilities, the demand will rapidly outstrip the supply.

WITHDRAWAL OF LAND USED FOR TRANSMISSION LINES

Department of the Interior Adopts the Policy of
Withdrawing Land Needed for Transmission
Line Right-of-Way

The Department of the Interior has made the following announcement:

In the Western States permits for the use of water-power sites and for rights of way for electrical power transmission lines are issued by the Secretary of the Interior under acts of Congress which provide for the occupation and use of lands by power companies. If, for instance, a permit were issued for a right-of-way over public lands and these lands were afterward taken up under the homestead law, a renewal of the permit could not be granted by the government, since the land would have passed into private ownership. In such a case a power company, after once having been granted a right-of-way from the government, would be compelled to obtain a renewal from all the individual landowners into whose possession the land had passed. The governmental policy has therefore been adopted of withdrawing land covering the right-of-way needed for a transmission line in order that this narrow strip of land affected may be permanently retained in government ownership. This leaves with the federal government full power to deal with permits for power-transmission lines.

CONTRACTORS' NEW PLAN TO BE MADE EFFECTIVE

Meeting of Executive Committee of National Association of Electrical Contractors and Dealers
to Be in St. Louis on Jan. 22

A meeting of the executive committee of the National Association of Electrical Contractors and Dealers will be held in St. Louis on Jan. 22 to effect permanent organization under the new constitution. The new plan of organization and the broad constitution which make it effective were prepared by a committee consisting of James R. Strong, William L. Goodwin and Earnest McCleary and were adopted at the annual convention of the association in New Orleans last October. Following the action of individual states in adopting the new constitution the St. Louis meeting will represent the official end of the old constitution and organization and the beginning of the new.

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

Annual Meeting Held at Pittsburgh—Papers of Interest to Electrical Engineers Presented at the Third Session

The annual meeting of the American Association for the Advancement of Science was held at Pittsburgh on Dec. 27 to Jan. 2. The sessions were held in the various buildings of the Carnegie Institute of Technology and the University of Pittsburgh.

In the engineering section the first meeting was devoted chiefly to good roads, pavements, transportation by motor trucks, and similar matters. The second session was on chemical engineering and on educational problems. The third and the last session was of miscellaneous character. Among the papers were: "Measuring Telephone Transmission," R. L. Snyder, plant engineer Central District Telephone Company, Pittsburgh; "The Electrical Safety Work of the Bureau of Standards," M. G. Lloyd, associate electrical engineer Bureau of Standards, Washington; "Higher Harmonics in Polyphase Electric Systems," V. Karapetoff, professor of electrical engineering, Cornell University, Ithaca, N. Y.; "Absorption in Paraffined Paper Condensers," L. Pyle, Washington University, St. Louis; "An Interesting Case of Resonance in an Alternating-Current Circuit," H. K. Dodge, the State University of Iowa; "On Electromagnetic Induction and Relative Motion," S. J. Barnett, Ohio State University; "Eddy-Current and Hysteresis Losses in Iron at High Frequencies," C. Nusbaum, Harvard University; "Influence of a Series Spark on the Direct-Current Corona," S. F. Crooker, University of Illinois. The paper by Mr. Snyder was a symposium of problems which a telephone engineer has to solve in achieving a satisfactory transmission of speech. Mr. Lloyd's paper was an explanation of the National Electrical Safety Code published recently by the Bureau of Standards. He outlined the history of the undertaking and mentioned the various interests that had to be reconciled. The code has no legal force, but has been adopted or recommended by many state and municipal authorities, and by a few branches of the federal government. Professor Karapetoff's paper was an extension of the well-known properties of higher harmonics in a three-phase system to a symmetrical m -phase system. He showed the conditions under which an oscillating neutral may be formed in such a system, or a partial short-circuit created in a mesh-connected m -phase winding. He described the formation of traveling mmf. waves along the air-gap of an m -phase machine and finally deduced the condition under which an m -phase winding may have the N -th harmonic in space due to the n -th harmonic of the current.

The physics section held several meetings together with the American Physical Society.

The discussion on Dec. 29 was devoted to "The Relationship of Physics to the War." The speakers included Lieut. G. P. Thomson (son of Sir J. J. Thomson) and Lieut. Giorgio Abetti of the Italian mission, who gave valuable information on the organization of European scientists for war purposes. The vice-presidential address was given by Prof. Henry A. Bumstead of Yale University on the "Present Tendencies in Theoretical Physics."

The American Metric Association also met.

SECRETARY DANIELS PRAISES NAVAL CONSULTING BOARD

Loyal Sacrifice of Civilian Body Stimulates Interest in War Problems and Leads to Valuable Results

Secretary of the Navy Daniels pays a tribute to the effective work of the Naval Consulting Board in his annual report, sent to Congress recently. He says:

During the year the work of this board, organized and approved by Congress in 1915, has increased very materially in importance and volume, its meetings have been frequent, and the work of its individual members has been such in some cases as to occupy almost their entire time in the service of the government.

Some time before the active entry of this country into war the board called a special meeting to which were invited some fifty of the leading scientists and industrial managers, whose special study fitted them to advise on the methods of meeting the submarine problem. Plans were immediately made to investigate every field to develop a means of preventing destruction of vessels and of defeating the U-boat. The investigation was divided according to the experience of the different members and associated scientists, and with the co-operation and valuable assistance of the various manufacturing companies interested a highly developed system of team work has been attained and results have been accomplished not dreamed of at the beginning of the war.

The services of the board were offered to the Council of National Defense and accepted by that body for the investigation of all inventions submitted. Its services were also accepted by the War Department in an advisory capacity.

Valuable assistance has been rendered merchant shipping by the board's activities. Through its initiative, counsel and work the United States Shipping Board formed its ship-protection committee, taking over the study of the protection of merchant ships, and to this committee was detailed one of the consulting board's most experienced members qualified in shipbuilding and with sea experience. In this field the board's work has resulted in materially reducing the shipping risk, with a consequent lowering of marine insurance rates.

Not the least result of its work has been the stimulation of interest throughout the country in the problems brought up by the war by the general invitation to submit ideas for investigation. Early in the calendar year 1917 this interest manifested itself in the receipt of thousands of ideas weekly, and to care for this the department's connecting office has been greatly enlarged, the office of the board in New York has been organized on a working basis with a large force, and the whole movement has received the approval and hearty assistance of the great national engineering societies. The president of the board, Thomas A. Edison, has been giving his entire time to the work of the board in the service of his country, and has called to his assistance a capable staff who are working diligently upon naval problems.

With war conditions increasing the need for labor and building materials, it was believed to be a wise policy to defer for a time the building of the new experimental and research laboratory. Such experiments as have been warranted have been made in private laboratories generously offered and at the Bureau of Standards. The need for this establishment, however, is more clearly shown than ever, and its support is urgently advised.

The valuable results obtained by the work of this board are of too confidential a nature to make them the subject of a public document. The members have given freely of their time and scientific ability to the service of the nation and have earned the gratitude of all who know their unselfish and patriotic service. I wish to express my sense of obligation for the cheerful co-operation, wise counsel, loyal devotion and personal sacrifice which have characterized the membership of the board of distinguished civilians who responded, long before war was declared, to the selective draft with all the enthusiasm and efficiency of youthful volunteers.

Arkansas Light & Power Company's New Office.—The general office of the Arkansas Light & Power Company is now in Pine Bluff, Ark.

Max Thelen on Public Utility Problems.—Max Thelen, president California Railroad Commission, has inaugurated the University of California extension course on public utility problems. This university extension course is open to all and is directed especially to lawyers, bankers, officials and employees of public utilities, city and county officials and others particularly interested in problems of regulation of public service corporations and in the way in which they are being worked out by the commissions.

Adirondack Power Consolidation Plan.—A new plan has been issued for consolidation of the properties of the Adirondack Electric Power Corporation, Schenectady Illuminating Company, Mohawk Gas Company, Schenectady Power Company, East Creek Electric Light & Power Company and Edison Electric Light & Power Company of Amsterdam. It is a substitute for the plan dated Jan. 27, 1917, and is subject to approval by the New York Public Service Commission, Second District. If not consummated during 1918, depositors will have the right to withdraw their stock on or after Dec. 31, 1918. If the unification is completed there would be outstanding \$11,500,000 of 5 per cent bonds, \$4,300,000 of 6 per cent preferred stock, and \$9,500,000 common stock. For the year ended Oct. 31, 1917, adequate gross earnings for the combined group were \$3,399,734, and net earnings \$1,113,611. Directors unanimously approve the plan, and urge stockholders to deposit their stock with the New England Trust Company, Boston.

Lighting in St. Joseph, Mo.—A proposition of the St. Joseph (Mo.) Railway, Light, Heat & Power Company to furnish energy for the entire street-lighting system of St. Joseph at the rate of 1½ cents per kilowatt-hour for the arc lights and the boulevard lights and \$37.50 a standard for the "white way" was made to the City Council recently. A suggestion that the company take over only the "white way" and the boulevard system at the figures offered was declined by J. H. Van Brunt and H. C. Porter, representing the company, who said that they could not make such a price for so small a contract. The prices offered, they said, could be made only in case the company received the contract to light the entire city. The company offers to bind itself to the contract for ten years but to allow the city to terminate the contract at any time on six months' notice and the purchase of the equipment actually in use. The company figures that the saving in the matter of arc lights would be about \$10,000, while another saving would be effected by the free use of the company poles in the extensions that might be made for additional lights. The expense of equipment for the boulevards alone would cost \$10,000, and equipment for all the street lighting would cost \$20,000.

Current News and Notes

Timely items on electrical happenings throughout the world, together with brief notes of general interest.

Opportunities to Serve the Nation.—The army and navy staff departments continue to demand men of engineering experience, especially in industrial lines. At present the outlook is that this demand will continue throughout the period of the war. In calling attention to this the United States Public Service Reserve, Washington (where records of men willing to serve when called will be kept on file), points out that a man of engineering experience has a rare combination of opportunities open to him which are not open to the average patriotic American, as follows: (1) To serve the country in his most effective capacity; (2) to keep in touch with his own profession, with the result that his patriotic service will not have caused him to become rusty by the time peace returns; (3) to become a commissioned officer and receive much better pay than the average man who has wholly subordinated personal interests, and now works for the national good; (4) to perform his service usually in America.

Free Class for Radio Operators at Stevens Institute.—A free evening class to train men as radio operators for the Signal Corps will be started soon by the Stevens Institute of Technology, Hoboken, N. J. Those who actually expect to be called to the colors will be admitted if prompt application is made to Prof. L. A. Hazeltine, head of the department of electrical engineering, under whose supervision the course will be conducted. The definite object of the course, which will require four evenings weekly, is to develop radio or buzzer operators to send a minimum of twenty words per minute. Upon finishing the course, which requires about 200 hours, less for some and more for others, a certificate of attainment will be given. The course is offered specifically for those who desire to enter a cantonment trained and ready to do a specific job. Washington authorities state that "drafted men who attain the required proficiency are practically certain of rapid promotion and increased pay in the army. The rank of corporal and sergeant, with \$36 to \$51 a month, awaits the majority of men thus trained, and in proportion as a man so instructed shows his ability and interest promotion lies ahead of him to the position of master signal electrician, with \$81 a month."

Another Engineer Regiment to Be Organized.—The co-operation of the American Institute of Electrical Engineers has been requested in the organization of the Thirty-seventh Engineers (electrical mechanical). This regiment will be organized at Fort Myer, Va., for electrical installation, operation and

maintenance in France. The officers for the regiment are available from the roster of the Engineer Reserve Corps. The classifications which it is desired to include in the enlisted personnel of the regiment are stationary engineers, motor-truck drivers, electricians, cable splicers, linemen, expert test men, wiremen, armature winders, machinists, pipe fitters, carpenters, blacksmiths, handy men and cooks. The opportunity to try for promotion as non-commissioned officers will be afforded to every enlisted man, as the regiment will be entirely new. The organization will be military as far as training, drills, discipline, etc., is concerned, as it is found that the health and efficiency of the men is in this way most readily maintained. Persons desiring to join the Thirty-seventh Engineers should apply for forms to the commanding officer, Thirty-seventh Engineers, Room 195, War Department, Washington, D. C. No enlistments will be received except by authority of this officer. Men in the draft age but not yet called may also make application.

"Material Costs Have Reached Their Maximum."—In a statement to stockholders, President Hanson P. Lathrop of the American Light & Traction Company says: "Your company is still passing through a period of high operating costs—prevalent in all lines of business. It is felt, however, that material costs have reached their maximum. Recent purchases show recessions from the high point. The period of high material costs for this company began in the midwinter season of 1916-17, and when that period of comparison is reached it is confidently expected that the usual satisfactory increases in net earnings may again be looked for. The enormous increase in gross business is much the largest in the history of the company, and with one exception the net earnings for the twelve months ended Sept. 30, 1917, were larger than for any corresponding period. Some stockholders have felt considerable trepidation as to the effect of the taxes imposed by the war revenue bill. The increase in the normal tax and the so-called excess profits provision do not apply to your company, holding companies being exempt from these particular provisions. The subsidiary companies will all be subject to the increase in the normal tax, but only four will be subject to the excess profits tax. These taxes, however, have been, to a large extent, taken care of by anticipatory charges made during the current year. When considering the large increase in operating costs in connection with the decrease in net earnings, the conclusions are not wholly unfavorable, but speak well for the future, when operating costs are more nearly normal. For the twelve months ended Sept. 30, 1917, net earnings show a decrease of \$529,153, while increased material and labor cost for the year was: Coal and oil, \$607,700; labor, \$262,400; labor and material, total, \$870,100; taxes, \$553,300; total, \$1,423,400. The total increase in gross business of the subsidiary companies for the above period is \$2,077,300.

D. J. ANGUS

D. J. Angus, who recently purchased an interest in and associated himself with the Esterline Company of Indianapolis, Ind., as treasurer, takes the responsibility of the engineering department and of the design and development of new lines of instruments and apparatus. Prior to his acquiring an interest in the Esterline Company Mr. Angus was associated with J. W. Esterline in a large consulting engineering business which has been developed in the Middle West. Mr. Angus began his career as an engineer in the construction department of the Milwaukee Electric Railway & Light Company, later handling electric construction for the Wisconsin Telephone Company and also the Semet Solvay Process Company of Milwaukee. He spent the years 1906 and 1907 in special work and investigation at the University of Wisconsin, and for several years following he was identified with some of the large electrical developments in the States of Michigan and Wisconsin. In 1909 he again took up the study of special electrical subjects, this time at the engineering department of the Michigan Agricultural College. In 1910 he became associated with Mr. Esterline in consulting engineer practice embracing the design, construction and operation of power and industrial plants and the design and development of new equipment and processes. Although yet a comparatively young man, Mr. Angus has taken part in some of the pioneering work in the development of the industry. In 1909 he did original work in the testing of transmission-line insulators with high-frequency currents and designed and built commercial apparatus embodying the application of this method of testing. He was one of the early advocates of charging for demand on a measured kilovolt-ampere basis, and as early as 1911 he made a commercially successful application of this system of charging. Furthermore, he designed the world's largest electric meter for the Mississippi River Power Company at Keokuk.

Major John Coffee Hays, formerly president of the Mount Whitney Power Electric Company, Visalia, Cal., is in charge of the newly created utilities department at Camp Lewis, Wash.

Men of the Industry

Changes in Personnel
and Position—
Biographical Notes

Earl G. Burwell has resigned as salesman for the Colorado Springs Light, Heat & Power Company to become commercial manager of the Wyoming Electric Company at Casper, Wyo. Mr. Burwell, prior to his association with the Colorado Springs company, was cashier of the Birmingham Railway, Light & Power Company.

W. H. Frost has joined the engineering staff of the United Gas & Electric Engineering Corporation as assistant electrical engineer. For a number of years Mr. Frost has been a member of the engineering department of the New York Edison Company, where he has had supervision of the design and construction of new substations.

Capt. Edwin W. Moore, president of the Bare Wire Company and chief senior aide to Major-General John F. O'Ryan, commanding the Twenty-sev-

E. W. MOORE

enth Division, United States Army, has returned to Spartanburg, S. C., after having been in New York for some time in conference with the Major-General, who has just returned from France. Captain Moore has been identified with the wire and cable industry for a number of years and has been a prominent figure at trade and contractors' conventions.

Harry Engle, for a number of years connected with the electric-lighting business in Youngstown with various concerns, and until recently with the Youngstown Heating Company, is now with the Mahoning & Shenango Railway & Light Company in an executive capacity, it is announced, and has been associated with the company since Nov. 1. Mr. Engle was formerly associated with the Mahoning County Light Company as secretary.

G. L. KNIGHT

G. Laurence Knight, head of the engineering department of the Edison Electric Illuminating Company of Brooklyn, was elected president of the Brooklyn Engineers' Club at the annual meeting held on Dec. 20. Mr. Knight, who was born on Feb. 20, 1878, received his electrical engineering education at Drexel Institute, from which he was graduated in 1900. After graduation he entered the employ of the Philadelphia Electric Company as a switchboard operator, and in the following year he took a position as an electrical draftsman with the United States Navy. In 1902 he became mechanical draftsman for the New York Edison Company, resigning in the same year to become manager of the Walker Electric Company, which was engaged in the manufacture of switchboards. From 1903 to 1905 he was chief draftsman for the New York Edison Company at the Waterside station, and from 1905 to 1908 he occupied the same post with the Brooklyn Edison Company. He was appointed designing engineer for the Brooklyn company in 1908 and is now head of the engineering department. Besides being a fellow of the American Institute of Electrical Engineers, Mr. Knight has long been a member of the standards committee and the electrical apparatus committee of the N. E. L. A., and for the last two years he has been chairman of the latter committee.

Obituary

John Henry Goehst died Jan. 1. He was the oldest employee of the Commonwealth Edison Company in length of service, having been construction superintendent for many years. Mr. Goehst had been with the company and its predecessors since 1882. He was a pioneer in the electrical industry, having been associated in early days with Luther Steiringer, Ward Leonard and others. He was greatly interested in the early history of the industry, was chairman of the history committee of the Commonwealth Edison Company and held many positions of influence in the company. Mr. Goehst also was president of the Federal Sign System, Electric. He had been long ill.

New Mexico Electrical Association.—The next meeting of this association will be held at Silver City, N. M., Feb. 11-13.

Northern White Cedar Association.—The twenty second annual meeting of the Northern White Cedar Association will be held at the Hotel Radisson, Minneapolis, Minn., on Jan. 22 and 23. Norman E. Boucher of Minneapolis, Minn., is secretary of the association.

Philadelphia Section of the Association of Iron and Steel Electrical Engineers.—This section will hold a meeting on Jan. 5 (to-day), at which J. C. Reed and Merwyn J. Hocker, electrical engineers of the Bethlehem Steel Company, will present and illustrate a paper on "Electrically Operated Bridges."

Officers' Electrical Section, W. S. E.—The nominating committee of the Electrical Section of the Western Society of Engineers has selected the following ticket for officers for the ensuing year: Chairman, E. N. Lake; vice-chairman, James A. Cravath; executive committee, Charles H. Norwood and Ernest Lunn.

Institute of Radio Engineers.—A meeting of the Institute of Radio Engineers was held Jan. 2, in the Engineering Societies Building, New York City. At this meeting Dr. Albert W. Hull of the General Electric Company presented a paper on the dynatron, an extension of the hot-cathode electron relay.

Pittsburgh Societies to Hold Joint Meeting.—The Pittsburgh Section of the Association of Iron and Steel Electrical Engineers will hold a joint meeting with the American Institute of Electrical Engineers in January. Papers will be presented on the generation, distribution and consumption of power as well as on power-factor correction.

The Engineering Society of York.—At the annual meeting of the Engineering Society of York, Pa., held recently, the following officers were elected for the ensuing year: President, James Rudisill; vice-president, Chauncey D. Bond; secretary, M. Haller Frey, Polack Building; treasurer, Harold A. Russell. The directors are George A. Jessop, Charles L. Berger and Howard J. Longnecker.

Three Hundred and Thirty-sixth Institute Meeting in Boston, New York and Chicago.—The three hundred and thirty-sixth meeting of the American Institute of Electrical Engineers will be an intersectional meeting held in Boston Jan. 8, New York Jan. 11 and Chicago Jan. 14. The same paper will be presented and discussed at the three places. This paper is entitled "Effects of War Conditions on the Cost and Quality of Electric Service." It is by Lynn S. Goodman and William B. Jackson, and is given under the auspices of the committee on economics of electric service. The paper will be presented at the New York meeting by Mr. Goodman and at the Boston and Chicago meetings by Mr. Jackson. Non-members of the Institute who are interested in this subject are cordially invited to attend and take part in the meeting.

Associations and Societies

The Directory of Electrical Associations, which is regularly printed in the first issue of each month, appears on page 79 of this number.

Future Section Meetings of the A. I. E. E.—The following A. I. E. E. section meetings are scheduled for January: Ithaca, Jan. 18, "Modern Transmission Line Practice"; Lynn, Jan. 9, "Steel Foundry Practice"; Philadelphia, Jan. 14, "Specifications Covering the Construction at Crossings or Overhead Lines of Public Utilities"; Pittsfield, Jan. 17, "Motor Drive in Textile Mills," S. B. Paine; Portland, Jan. 8, "Powdered Coal for Fuel"; Feb. 8, "Electric Smelting of Iron"; San Francisco, Jan. 25, "Corona at High Altitude"; St. Louis, Jan. 23, "Electrical Equipment of New Post-Despatch Building."

St. Louis Jovian League Holds Christmas Feature Meeting.—The St. Louis Jovian League held a very interesting meeting at the American Annex Hotel Tuesday, Dec. 18, in which women relatives and friends of the members participated. As it was the last meeting of the year, it was designated a "Christmas feature meeting." George Platt Knox, assistant superintendent of public schools, was the speaker of the occasion and delivered a lecture, illustrated with slide pictures, entitled "Jerusalem to Bethlehem." The meeting was under the auspices of the Allis-Chalmers Manufacturing Company and was presided over by C. L. Orth, district manager of the company, assisted by Herman Spoehrer, treasurer of the Union Electric Light & Power Company. Among the guests present were Mr. and Mrs. Leonard Matthews, father and mother of Past Jupiter W. N. Matthews, president of the league.

December Meeting of Kansas City Jovians.—The Jovian Electric League of Kansas City held its second successful monthly meeting of the season at the Muehlebach Hotel, Dec. 21, with sixty in attendance. A service flag, with eleven stars, was presented by E. L. Foutch. The honor roll contains the names of P. J. Kealy, president of the Kansas City Railways Company, and K. D. Klemm, president of the Kansas City, Kaw Valley & Western Railway, the former a colonel of infantry, the latter a colonel of artillery. W. S. Woodland, formerly in charge of safety work for the railways company, received a commission at Fort Sheridan as lieutenant of aviation. The other Jovians on the roll are Charles R. Born, R. P. Bailey, R. H. Cowdry, Jr., F. W. Gary, A. E. Herzberg, W. E. Saylor, C. H. Taylor and L. H. Shoemaker. Captain R. W. Simmie, formerly at the front, now in charge of British recruiting at Kansas City, spoke at the luncheon. Major Norton and Lieutenant Robinson of the Engineers' Corps, Fort Leavenworth, were among the guests.

Annual Meeting of the American Metric Association.—The annual meeting of the American Metric Association was held at Pittsburgh Dec. 28 and 29. Most of the sessions were held at the University of Pittsburgh, the first two sessions in conjunction with the social and economic sections of the American Association for the Advancement of Science. The association is working for the most effective co-operation between the United States government and our allies. At this time, when the army and navy are making extensive and increasing use of the metric weights and measures, comes the desire on the part of those in the service to familiarize themselves with the best and most effective methods of applying these units to their particular work.

Relation of Science and Engineering to the War.—The extent to which men of pure science and men of applied science have aided the United States in prosecuting the war was told at length in a paper presented by Prof. Harvey Lemon of Chicago for Major R. A. Milliken, executive officer of the National Research Council, Washington, D. C., before a joint meeting of the electrical organizations of Chicago, Dec. 27. Major Milliken was prevented from delivering the paper himself by an imperative recall to Washington. The author expressed the opinion that the scientist engaged in what is only indirect war work is just as useful and as heroic as the one who is engaged directly in war service. He emphasized the point that it is foolish for engineers and scientists to flock to Washington to learn what they can do to aid the government. Lists of experts in all lines are available at Washington, and when men are needed they are requested to take up the work. Those who are still in civil life should continue to prosecute their work as efficiently as possible. Comments on the direct contribution of science to the war brought out that many problems have already been solved. Advancement has been made in submarine detection. Methods of locating guns by means of sound waves are now so accurate that guns within a radius of 5 miles (8 km.) can be located within 50 ft. (15.2 m.). In a recent battle no less than sixty German guns were located and destroyed through the use of this system. Scientists of the United States have made large strides in gas offense and defense. The scientific mission from abroad advanced the United States a full two months in its scientific war preparations. What is true of the realm of pure science is also true of applied science and engineering. Here also a large contribution has been made. Major Milliken gave quite a complete review of the organization and the eminent personnel of the National Research Council. He also stated that its aim was to give American science an opportunity to assist in winning the war. In closing the author expressed the fervent hope that the work of scientists and engineers in the war would fill the chasm which has been allowed to deepen between physics and engineering. The future of America is linked with science.

Commission Rulings

Important decisions of various state bodies involving or affecting electric light and power utilities.

Review of Coal Costs.—In the decision of the New Jersey Board of Public Utility Commissioners on the application of the Bridgeton Electric Company to increase rates, mentioned previously in the *ELECTRICAL WORLD*, the testimony showing the following costs of coal at the power station was reviewed: 1904, \$3.40; 1905, \$3.42; 1906, \$3.29; 1907, \$3.32; 1908, \$3.37; 1909, \$3.45; 1910, \$3.30; 1911, \$3.31; 1912, \$3.35; 1913, \$3.33; 1914, \$3.60; 1915, \$3.53; 1916, \$3.70. Reviewing the testimony on coal costs, the commission said: "It was testified that contracts had been made for the supply of coal to Bridgeton, but that no coal had been received under such contracts for some time past, and the prices paid have varied considerably. The average price at the mine for the coal sent to Bridgeton in the first five months of 1917 was \$5.16. In addition to the higher price for coal, the cost of delivering this coal at Bridgeton from the mine, including the delivery in power plant, was \$2.05. During May, 1917, the price paid for coal was \$6.25 at the mine, plus \$2.05 for freight and delivery. The last price, paid about three weeks prior to the date of the hearing, was \$5.65 plus cost of freight and delivery. The increase in the cost of coal results in a material increase in the total cost of furnishing electric service, and might result eventually in a deterioration in the character of service. The testimony submitted at the hearing showed that no more than a fair return was being obtained on the invested capital of the electric service company."

Indiana Fixes Electric Service Standards.—The Indiana Public Service Commission has adopted new standards for electric utilities. They were worked out after many conferences held by Harry O. Garman, chief engineer of the commission, following action by the commission authorizing uniform standards for electric utilities. The standards have to do with records and reports, meters, meter-testing equipment and facilities, meter accuracy, information for consumers, adjustment of bills for meter error, incandescent lighting, deposits by customers, operation and maintenance, standard frequency, standard voltage and permissible voltage variation, voltage surveys and records, interruptions of service, station instruments, station records, accidents, grounding of low-potential circuits, extension of lines, pole identification and many other topics. Conferences with J. Franklin Meyer, associate physicist of the United States Bureau of Standards, and frequent reference to similar standards and similar work of such

commissions as those in New York, New Jersey, Illinois, Wisconsin, California and Kansas, were held before the engineering staff of the Indiana commission was ready to submit the proposed standards to the managers of private and municipal utilities in Indiana for suggestions from them. The purpose is to provide uniform service and to give the small utility the advantage of big utility practice wherever possible. "The big utilities do not need such standardization to such an extent as the smaller plants," said Mr. Garman. "Under these new standards a consumer may know when he is getting good service and the utility managers may know when the utility is delivering good service."

Sale of Property.—In a decision on the application of the Marianna Light, Heat & Power Company for approval of the transfer of its property and franchise rights to the Union Coal & Coke Company the Pennsylvania Public Service Commission holds that where a light, heat and power company purchased its power from a company which subsequently went into the hands of receivers and where by a receivers' sale all possibility of securing power from said company ceased the commission, with much reluctance, will permit the light, heat and power company to sell its facilities to the purchaser of the property which was sold at the receivers' sale.

Requirement of Extensions.—The Pennsylvania Public Service Commission in deciding the complaint of Fred Palmer-Poroner vs. the Consumers' Gas Company of Reading concludes that a utility cannot under all circumstances refuse to make an extension of its service until the same becomes compensatory. A public utility engaged in the business of the respondent is required to furnish service in all parts of the municipality in which it is operating whenever a reasonable demand or prospect for such service is shown to exist. The service cannot be restricted to sections or neighborhoods from which the larger returns will flow, but must also be extended to localities where the business will not be immediately profitable or perhaps even self-sustaining until a later period in the growth and development of the community. Where circumstances so shaped the development of the utility's business that small central blocks or areas containing desirable homes and sites, particularly in a large city, have been supplied with service, it is only a matter of simple justice that the residents on any such block, if they so desire, should be accorded the same privileges and conveniences that their neighbors in adjacent streets are permitted to enjoy. But where there is no demand for service from the residents themselves, and there is no prospect of securing at present more than six small consumers who will use gas for fuel during the summer only, the commission will not compel the gas company to install a new gas main 580 ft. in length at a cost of approximately \$800 until it can be shown by evidence that the persons who are directly affected desire the service.

Recent Court Decisions

Findings of higher courts in legal cases involving electric light, power and other public utility companies.

Power of Commission to Authorize Securities.—By law a public utility has the right to issue whatever bonds and stock may be necessary to carry out corporate powers, acquire property, construct and extend facilities and maintain and improve service, and the Public Utilities Commission has no general discretion to refuse to certify such securities, the Supreme Court of Kansas held (167 P. 1138). The Public Utilities Commission has full power to ascertain the truth of all statements made by a public utility in its application for a certificate validating a bond and stock issue, including the required statement that the capital stock to be secured is necessary for a specified statutory purpose and will be used therefor. The word "necessary" as used in the statute means needful under all the conditions attending the enterprise. The Public Utilities Commission has authority to require proof of need for the issuance of bonds and stock beyond the proof afforded by the verified application.

Right to Operate Under Terms of Charter.—Where an electric light and power company received a charter authorizing it to maintain and operate its plant and dispose of energy, providing that it could not exercise any of its powers within the limits of any town, village or city without the consent of the local authorities, the company could not, under a private grant, provide street-lighting service and supply energy for private consumption in a town without consent of the town board, it was held by the Supreme Court, Appellate Division, of New York (167 N. Y. S. 486) in *Oneonta Light & Power Company vs. the Public Service Commission*, Second District. Although an electric light and power company had a private grant of way to construct its lines, the Public Service Commission, under the section of the Public Service Commissions law requiring the consent of the commission to construction work, had the power to supervise the construction of its lines. The Legislature has the power to prescribe the conditions upon which a corporation of the State may operate. In view of the Public Service Commissions law defining the term "electric plant" to include all realty, fixtures and personalty used in connection with generation, transmission, distribution or sale of electricity for light, heat or power, an electric company attempting under private grant to dispose of energy to private consumers is "beginning construction of an electric plant" within the law giving the commission authority to supervise construction.

TRADE & MARKET CONDITIONS

News of the Trade for the Manufacturer, Wholesaler and Jobber
of Electrical Equipment and Supplies—
Notes on Industrial Activities and Business Methods

ELECTRICAL TRADE SHOWS STRENGTH IN FIRST WAR YEAR

Review of Conditions Affecting Production, Distribution and Sale of Electrical Products
During 1917

STARTING with a heritage from 1916 of a quarter of a billion dollars of unfilled orders, the electrical manufacturing industry in 1917 far exceeded the record set in 1916 both in billings and bookings. Although the country was engaged in war nine out of the twelve months of the year, the industry has shown on the whole no diminution of output but rather a very considerable increase. Careful and conservative estimates place the 1917 billings of electrical manufacturers in the near neighborhood of \$750,000,000, while unfilled orders at the close of the year were certainly not less than \$300,000,000. Thus the 1917 electrical manufacturing industry can be said to have passed the billion-dollar mark.

EVIDENCES OF BETTER BUSINESS POLICIES

In 1916 the electrical trade, experiencing its first real sellers' market, was for the most part at a loss as to just what to do. There was no precedent—no guide to follow. However, as every one became more accustomed to prevailing conditions a more staple state of affairs emerged. Consequently in the year just closed the industry grasped the opportunity to straighten out many tangles of sales custom, distribution and production. The natural result has been that the industry has closed the year with a better state of competition existing.

Many old practices, including that of protective orders and of price-increase announcements, have seen the beginning of the end. Closer thought has been given to the matter of credits and collections than ever before. The old question of the cash discount has been under fire considerably and, while not settled, is better understood. Besides, there has been an unmistakable tendency among manufacturers in the last half year to hold customers strictly to the "spirit of the law" in discounting bills. Charging interest on past-due accounts has been urged but is not meeting as yet with much enthusiasm.

Trade acceptances are in greater evidence in the trade, and there is a decided movement, particularly among jobbers, to institute a more general use of this credit system.

As a further evidence of a tendency toward better merchandising in the trade, there has been noticed throughout the year a marked desire, particularly on the part of the jobber, to help the retailer become a better business man. The credit men have gone on record as favoring the use of a simple accounting system for the retailer. A system of balanced stocks has been suggested. More helpful attention is being given to the "moral-risk" customer. Greater study has been given to the subject of dealer helps. In all there has been more real action in elevating the retailer than ever before.

Besides, the jobber has been cleaning house of poor business methods. The jobber is paying more attention to business and is not so quick to take trade without a fair and reasonable profit. There has been less price cutting during the past year than ever before. Buying has been more careful and less speculation has been in evidence.

UPWARD TENDENCY OF PRICES

Prices, except for raw materials, had an upward tendency throughout the year, but not to such a marked degree as in 1916. Heating appliances advanced every few months.

Glass and porcelain products increased, as did many other staples. As the year closed announcement was made of the first increase in the price of incandescent lamps. On the other hand, certain products, including wire, were lower in price as the year came to a close. In May, for the first time in the history of the industry, the ELECTRICAL WORLD started publishing current market prices, and it has continued this work weekly ever since.

METAL PRICES LOWER

In the raw-materials market the government price-fixing program, which found expression in September in lowering the price of copper and steel products, has been the dominating factor. Metal prices, except for tin and nickel, were much lower in December than in January. Following is a comparison of metal prices in New York during the first and last weeks of the year:

	Jan. 3			Dec. 24		
	£	s	d	£	s	d
Copper:						
London, standard spot....	133	10	0	110	0	0
Prime Lake	29.00	to	29.50*	Govt. price	23.50	
Electrolytic	28.00	to	29.00*	Govt. price	23.50	
Casting	27.00	to	28.00*	Govt. price	23.50	
Wire base	36.00	to	38.00		27.00*	
Lead, trust price			7.50		6.25	
Nickel, ingot			50.00		50.00	
Sheet zinc, f.o.b. smelter....			21.00		19.00	
Spelter, spot	9.67½	to	9.92½		7.67½	
Tin, Straits	42.75*				85.00†	
Aluminum, 98 to 99 per cent.	55.00	to	58.00*	34.00	to	36.00
Heavy copper and wire	24.00	to	25.00*	22.00	to	22.50
Brass, heavy	14.50	to	15.50*	14.00	to	15.00
Brass, light	10.50	to	11.00*	9.50	to	10.50
Lead, heavy	6.50	to	6.62½*	5.75	to	5.87½
Zinc, old scrap	6.00	to	6.25*	5.00	to	5.50

*Nominal. †None offering.

While business in electrical goods both by manufacturers and wholesale distributors was larger in 1917 than ever before, it was of a very different nature than is the case in normal times. In the past utilities, electric street railway and telephone, and building construction had been the principal markets. To-day the government and industry control the situation. Because of their inability to borrow money except at prohibitive rates utilities have almost entirely withdrawn from the market. In fact, in some instances cancellations of undelivered orders are being requested. Except for factory building, there has been a very heavy curtailment of new construction. Hotels, churches, office buildings, apartment houses, etc., have wherever possible been held over until more satisfactory times. Contractors as a result have not been busy and fixture people have been experiencing a business far below normal.

There have been few new developments of products. Research laboratories have been kept busy largely on government work. There have been a number of modifications of equipment replacing expensive material with less expensive, such as steel guards for brass fans. Electric furnace development, however, has been very large and rapid and many new models were brought out during the year.

STANDARDIZATION PROGRESS

There was during the year considerable progress in standardization, particularly in appliances. About 90 per cent of the 1917 fan production had steel guards and were furnished with cord and plug. Toward the end of the year a standard length of cord—8 ft.—was decided upon. Four blades except in large sizes is now standard, and the old name "desk and bracket" has given way to "non-oscillating." Steps were taken during the year also to standardize appliance plugs. Besides, the committee on trade literature of the Associated Manufacturers of Elec-

trical Supplies has recommended the standard catalog size of 8 in. by 10½ in.

THE PROBLEM OF LABOR

Two of the greatest difficulties that the trade has had to contend with during the past year have been labor shortage and transportation congestion. Both have handicapped production and deliveries. In the electrical manufacturing industry there were fewer strikes and less serious ones than during 1916. Labor, however, was still roving. There was a serious shortage throughout the year in mechanics and similar skilled labor and in unskilled labor. Of the other large class of labor, however, statistics show a growing percentage of unemployed. After the war broke out the labor situation became worse. First, the army and navy took almost 10 per cent of the male labor in the electrical industry and second the government, through cantonment construction and the shipyards, put a severe strain on labor by offering an opportunity to earn the largest wages on record in the United States for that kind of labor. In addition, the female labor supply apparently became less. A large amount of female labor is employed in electrical manufacturing, and the scarcity has hampered production considerably. Higher wages were paid during the year and high-cost-of-living bonuses were given by manufacturers rather generally.

The only ray of hope in the labor market came in the winter months early in the year, when the closing of plants that had completed war contracts for Russia and other warring nations released large numbers of skilled workmen. The entrance of the United States into the war, however, made the demand for this kind of labor more acute than ever.

On Sept. 1 the child-labor law guarantee was demanded of dealers as well as manufacturers.

TRANSPORTATION DIFFICULTIES

Transportation congestion as the year opened was very bad, growing worse until the Eastern seaboard in March was in an almost hopeless condition. This was a great handicap to both buyers and sellers in deliveries already very long. Embargoes were placed on freight for export shipment and a lot of other material eastward bound. The lack of tonnage for export caused docks and warehouses to be filled to capacity, rendering the removal of goods still more difficult. During the summer months, however, the shortage in freight cars was decreased by about a third, but by September it was worse than ever. The transportation situation became still more serious until the government, feeling that private operation could not solve the problem, even with transportation priority orders, stepped in a few days prior to the end of the year and took over the control of all roads under Secretary McAdoo.

CONDITIONS IN LAMP MARKET

Demands for materials, as before stated, were particularly large. Lamp manufacturers for many months found it impossible to keep up with orders. Shortages developed in every section of the country, being particularly acute in the Far West and in New England. Every effort was made to cope with the situation, and by the late fall months the manufacturers advised the ELECTRICAL WORLD that they had just been able to lay in local stocks in most standard sizes but still were behind in miniatures. During the year central stations were placed on the agency plan for Mazda lamps. Under the licensing arrangement the importation of tungsten lamps became illegal.

FAN STOCKS AGAIN DEPLETED

Wholesale fan stocks were sold out earlier this year than ever before, and as in 1916 the season closed with the market practically void of every kind of fan stock. The great hot wave in the first week in August ate up almost all fans available.

Although prices advanced at regular intervals during the year on heating appliances, the output established a new record. In some instances manufacturers announced the increases prior to their going into effect, with the result that buying was greatly stimulated. In November the merger of the Hotpoint, Hughes and General Electric domes-

tic heating appliance businesses into the Edison Electric Appliance Company was announced.

TURBINE PRODUCTION SOLD OUT EARLY

Turbine production for 1917 was early sold out, and by the first of June 1918 and 1919 production for larger sizes had been booked, with orders running to 1920. The largest single order on record, 200,000 kw. in turbines, was placed in May.

Transformers and motors in large sizes were particularly hard to obtain after the middle of the year. Production has been booked far ahead. In the early fall it was estimated by good authority that manufacturers were 150,000 motors behind orders.

The second-hand market flourished as never before during the year. High prices prevailed. Dealers found it very difficult to secure equipment. Much of this equipment was ordered only until such time as new goods could be delivered. In this way some machines were sold and resold many times during the year. The government frequently found the second-hand men to be very valuable when especially quick deliveries were needed.

WAR HEIGHTENS DEMANDS FOR MANY PRODUCTS

The declaration in the first week in April of the existence of a state of war opened a large demand for many electrical products. The sale of floodlamps for protective purposes increased in a few weeks 500 per cent. This demand, however, was soon satisfied and sales then dropped off. Flash-lamp manufacturers were soon swamped with orders owing to the military and export demand.

The need for greater production and for efficiency in labor and saving in time brought unparalleled sales of electric industrial trucks. Manufacturers are working at capacity production and are booked many months ahead.

Furthermore, the direct government demand for cantonments and shipyards was large and, besides, it was almost entirely for immediate shipment. For a time it looked as though the government buying would entirely disarrange the manufacturing of the country, but the producers quickly took steps to co-operate with the government in the matter of placing contracts. Committees of wire and other device manufacturers took the government orders and apportioned them among the different factories so that none were burdened more than others. As a result the government received a better price and better deliveries and the industry was upset as little as possible.

In order that the government and factories working on government contracts might obtain electrical goods as quickly as possible the priority plan was introduced. This worked all right for a while, but in the late fall it became evident that the amount of priority orders was fast approaching the entire production. Steps, however, have been taken to remedy this and to make sure that only bona-fide "war" orders receive priority.

EXPORTS OVER \$50,000,000

Exports increased considerably during the year up to the fall months. In March electrical exports for the first time passed the five-million-dollar mark. For the fiscal year closed June 30, 1917, exports were \$52,158,773. Owing to the falling off in the last few months of the year it is very doubtful if the exports for the calendar year 1917 surpassed the above figure. Foreign demand was larger than could be handled. An interesting sidelight is the growing export demand for electric heating and cooking appliances brought about by the high price of coal abroad.

Collections were in general particularly high during the year. January and February collections set new high records. The entrance of the United States into the war, however, caused accounts to be settled with less freedom for a month or two. The two Liberty loans brought some slackening in collections, but nothing very serious in the electrical industry.

Thus the manufacturing industry and the trade closed the year in a very satisfactory and strong position. Jobbers' stocks have been pared down and unfilled orders are large. Competition is better and the business is generally on a more sane basis. The war has not lessened the business of either jobber or manufacturer, merely changed it.

WIRE PRODUCER EXPECTS DEMAND TO BE LESSENED

Central Stations and Trade Generally Are Urged to Watch the Market More Closely than They Have Done Heretofore

Adverting to the subject of wire base the other day, the head of one of the important departments of a prominent manufacturer of electrical apparatus, equipment, supplies and accessories said to a representative of the ELECTRICAL WORLD: "Conditions affecting the status of wire base should be better known and understood by the trade. If a buyer should appear, it is my judgment the wire men would quote him all sorts of prices. I figure that the nominal price of base is 34 cents, but we are naming 30 cents. I will admit that the drawer of wire, after paying, say, 24.67½ cents, unless he bought in larger than car lots, when 23.50 cents would be the price, estimates that it costs him about 4 cents between the copper producer and the running through his mill. The cost of finished product is arranged on such basis.

"Now, it looks to me as if there would be a falling off in the demand for copper next year, which may be accounted for on the ground that the requirements of central stations and public utilities will be less. The central stations are already taking precautions to protect themselves by refusing to make extensions unless the cost of the work is advanced. Industrial customers in the great manufacturing districts along the Atlantic seaboard have been notified that increased light or energy will be furnished only when they are engaged in governmental work. In these cases an official certificate to this effect must be forthcoming, otherwise the application is peremptorily refused. The disposition of the central station is to take on no further load.

"All this means that the demand for wire will be less than it has been for some time. Consequently I look for easier conditions—in deliveries and quantity, if not in price—than have prevailed for some time. The trade should therefore keep itself in closer touch with the market and look and inquire for inside information. Jobbers and dealers would then be in a better position to figure more understandingly on their requirements and place orders."

NEW PRICES OF LARGE INCANDESCENT LAMPS

Detailed Prices of Mazdas and Graphitized Filament Units, as Effective Jan. 1, Grouped According to Regular Schedules

Following the exclusive announcement in last week's ELECTRICAL WORLD of the advance in the prices of incandescent lamps, effective Jan. 1, 1918, the appended tables give the price schedules complete on large Mazda and graphitized-filament units. The prices are arranged according to regular schedules, which are as follows:

Schedule 1—Mazda lamps for standard lighting service—straight-side and pear-shape bulbs—110 to 125 volts.

Schedule 2—Mazda lamps for standard lighting service—straight-side and pear-shape bulbs—220 to 250 volts.

Schedule 3—Mazda lamps for ornamental-lighting service—round and tubular bulbs—110 to 125 and 220 to 250 volts.

Schedule 4—Mazda vacuum lamps for sign-lighting service—straight-side bulbs—11 to 12½, 55 to 65 and 110 to 125 volts.

Schedule 5—Mazda vacuum lamps for electric street railway service—straight-side bulbs—for use five in series on 525, 550, 575, 600, 625 or 650-volt circuits.

Schedule 6—Mazda gas-filled lamps for use in series on street-lighting circuits—straight-side and pear-shape bulbs—lamps rated at 5.5, 6.6, 7.5, 15 and 20 amp.

Schedule 7—Mazda lamps for train-lighting and locomotive-headlight service—straight-side and round bulbs—5½ and 6, 30-34 and 60-65 volts.

Schedule 8—Mazda lamps for use with country-home lighting outfits—straight-side and pear-shape bulbs—16-cell (28-32 volts).

Schedule 9—Mazda daylight lamps—pear-shape bulbs—110 to 125 volts.

Schedule 10—Mazda gas-filled lamps—concentrated filaments for focusing purposes—round bulbs—5½ and 6, 30-34 and 110 to 125 volts.

Schedule G—Graphitized-filament lamps for standard lighting service—110 to 125 volts.

WHERE THE BOILER-ROOM DEVICE MARKET IS HEADING

Trend Indicated by Census Statistics Shows on
Analysis How Rapidly "Rented Power" Is
Superseding "Owned Power"

The United States census data show that in 1889 only 2 per cent of the total power in the country was "rented power," that is, central station power. In 1904 this ratio had increased from 2 per cent to 3.3 per cent. In 1909 it was 9.4 per cent, and in 1914 it was 17.4 per cent. During the same period and for the five-year intervals above named the electric-motor rating in active service practically doubled with each five years. Since the last five-year census report the greatest three years of industrial activity this country has ever seen have been experienced. Not only has the total of active power-generating apparatus been increasing at a terrific rate, but the gain in the central station percentage column has been progressing by stupendous strides owing to slow deliveries of prime movers and high fuel prices. According to close observers it is entirely safe to estimate that the census report of 1919 will show that 33 per cent of the total power is rented power.

If viewed in their relation to the so-called boiler-room device market, these facts point to a decreasing demand among isolated power plants and an increasing demand for the same or similar equipment among owners of large power-producing companies. The total volume of trade, however, will probably diminish owing to the very large number of isolated plants now going over to central station service. Besides, considerably fewer of the new plants are installing their own generating systems owing to two fundamental factors, (1) inability to obtain satisfactory delivery of plant equipment, and (2) the seriousness of the fuel situation.

METAL MARKET SITUATION

Copper Not Being Hoarded—Stranded Wire Not Equal to Demand—Better Supply of Tin Probable

According to the most reliable sources of information there is no likelihood of the government advancing the price of copper, or of there not being enough metal to meet all urgent needs. Consequently there is no disposition to acquire copper or hoard it for future contingencies. There is a strong demand for wire, and deliveries are none too satisfactory in standard sizes. The stranding machines have not been able to keep up with the demand for the last three years. Rubber-covered as well as slow-burning wire is commanding the greatest attention and largest sale at the present time.

With no tin offering, the price remains nominal. From official reports a large supply may reach the American market from the Straits via the Pacific route, by an arrangement with Great Britain. The latter has now prohibited the sale of zinc, brass, lead and nickel. Copper, steel and iron were already on the prohibited list.

NEW YORK METAL MARKET PRICES

	Dec. 24	Dec. 31
	£ s d	£ s d
Copper:		
London, standard spot.....	110 0 0	110 0 0

Zinc, old scrap	5.00 to 5.50	5.00 to 5.50

*Nominal.

THE WEEK IN TRADE

THE predictions that the sale of holiday specialties would shrink this year has proved unfounded, for the volume in some sections exceeded previous records. In others it equaled that of the year before. Shortages on wire, heavy motors, conduit, etc., are reported in spots, with other staple stocks in satisfactory condition. Everything possible on order was shipped in from the manufacturers and prominent distributors to jobbers and dealers before the books were closed.

A lull has followed the usual stress of selling on the Christmas account, and inventories have occupied the attention of every branch of the trade during the week. Some increases in price have materialized, and others are contemplated with more than a fair chance of realization in the near future. Shipments still are delayed by the embargoes and freight congestion. The governmental railroad control is expected to mitigate the situation in due course.

Trade financial affairs are stated to be in excellent condition. Collections have figured on a basis apparently up to expectations. No loose rein is being drawn on credits.

NEW YORK

With the opening of the new year there is every indication that business will improve in the greater distribution and sale of electrical merchandise. Jobbers' and dealers are still busy with inventories. Orders placed with manufacturers and primary distributors for early delivery cover a wide range of products, chiefly staples. The last week in the year is always quiet, and there was no exception for 1917.

New prices on a higher level went into effect on several items on Jan. 1, and prior thereto, and there is a possibility of further announcements to the same effect. The market is restless on this score.

Financially the trade is in a sound condition, with collections making a new record and credits in good shape.

PANELS.—A new line of panels will be brought out by a manufacturer with the first of the year. The announcement covers about a half dozen types, with a range of prices in accordance with the models and finish. Quotations have not changed on the regular lines.

FANCY FIXTURES.—Goods of the fancy or decorative type in lighting fixtures were expected to advance in price around Jan. 1. Of course, should this prediction prove well founded, it will be due to the feverish condition of the metal market.

CROSS-ARMS.—On Dec. 17 an advance of 10 per cent was declared. Deliveries are tightening up. The congressional committee investigation of the lumber situation has hastened the placing of orders for early delivery, if such a thing be possible. This is tying up the situation.

MOTORS.—From fractional sizes up to 40-hp. motors an increase in price is looked for, but it is uncertain. It may come along any time, Jan. 1 being the date originally fixed for the notice. There is an acknowledged falling off in the buying of these types at present. Shipments are reported as extremely poor.

COLLECTIONS AND CREDITS.—The wind-up of the year and the start of 1918 find collections in a very fair condition. Credit authorities state that no relaxation on their part will be visible for an indefinite period. The "slacker" has no standing whatever.

GLASS INSULATORS.—With an advance of 12½ per cent last month the supply and delivery of insulators is fair. The coal situation is tending to slow up production at the glass factories. The high cost of fuel has caused the elevated price.

PORCELAIN.—The government is reported as having requisitioned everything in porcelain goods. Consequently there is something of a shortage in sight.

RADIATORS.—With the zero weather prevailing during the past week, the demand for radiators and all heating devices was abnormal. The heaviest stocks in the hands of the jobbing distributor were drawn down, and hurried calls for fresh and rush supplies to the factories were made. Large shipments were immediately placed in transit and hurried forward to relieve the market.

HOUSEHOLD SPECIALTIES.—An advance of 8 to 8½ per cent on portable sewing machines and about 10 per cent on washing machines is reported as coming on Feb. 1. A rumor which has been gaining momentum, that domestic heating appliances were to be increased in price Jan. 15, will doubtless be fulfilled in the near future, according to authoritative information. The size of the addition, it is stated, will be dependent on the metal situation, condition of stocks, and other market contingencies.

CHICAGO

The trade generally is resting on its oars after the spurt required to keep pace with the lively holiday trade which developed just before Christmas. Inventories are being taken, and, as is the custom, these are being allowed to occupy practically the entire attention of both the distributors and retailers. Several organizations are also taking advantage of the quiet condition of affairs to hold sales meetings, also giving out-of-town representatives an opportunity to spend the holidays in the city. Probably the feature of the week may be said to be the announcement that lamp prices will be increased.

CHRISTMAS RETAIL TRADE.—The holiday trade was not up to last year's volume. The buying was slow until the last few days before Christmas; then a rush started which lasted until the doors closed on Christmas Eve. A peculiar feature of the buying was that when it did start it was particularly active in the higher-priced appliances. Percolators, sewing-machine motors and all sorts of household devices were in good demand. In some quarters the opinion is given that the holiday trade this year was 20 per cent under what it was last year.

JOBBER'S INVENTORIES.—It is the opinion that the inventories of jobbers' stocks will show values above normal. It is probable that the volume of stock now on the jobbers' shelves is very little in excess of normal. Such items as are carried in more than normal quantities are goods that it seems expedient to carry on account of delivery situations.

CHRISTMAS-TREE LAMPS.—The complaints from purchasers of Christmas-tree lamps last year were numerous. This year they were more numerous. Filament trouble caused this unduly large amount of dissatisfaction. Just blame can hardly be placed on the lamp manufacturers, however, for they have had their troubles in the miniature-lamp field, mostly through no fault of their own.

COPPER WIRE.—Jobbers are on a 35-cent base, with some manufacturers quoting a trifle lower.

CONDUIT.—There are still some stocks of conduit, but the question of the jobbers replenishing them is occupying attention.

LAMPS.—The announcement of a 10 per cent increase in lamp prices was accepted in the most part with the statement that the manufacturers deserved credit for refraining so long from raising prices in the face of rising labor and material costs.

FUSES.—The purchases of fuse companies in the Middle West recently by other fuse companies in the field is said in no way to presage a decrease in prices. It is said in some quarters that the prices of fuses will probably be higher before they are lower.

CREDITS AND COLLECTIONS.—There is very little activity this week, the disposition being to let things slide until the first of the year.

GLASS INSULATORS.—The glass-insulator business is now in such shape that some manufacturers are able to ship orders on the day received, if necessary.

COFFEE-URN HEATERS.—Orders for coffee-urn heaters have been coming in with regularity and in larger quantities than ever before.

BOSTON

Jobbers and retailers generally report an excellent volume of Christmas trade, but possibly from 10 to 15 per cent below last year in holiday specialties and heating appliances. The final week's business was about the same as a year ago. The usual pre-New Year lull followed the holiday. Jobbers and wiring contractors report a very active industrial business, and government work appears to be increasing in volume. House wiring is practically at a standstill, except in repair and alteration jobs, which are giving some of the smaller contractors much-needed work. At Lewiston, Me., shipbuilding is causing active house wiring, however. Collections are reported slower from contractors and central stations, but very good from mill customers. The outlook is clear for a year of extreme activity along war-business lines, including auxiliary productive work closely related to government needs.

Prices remain firm, and deliveries, it is anticipated, will improve somewhat, in priority classes, at any rate, as the result of government control of the railroads. Transportation companies will now be entering the market for supplies through government financing and supervision, and the electrical industry will undoubtedly benefit from their improved status. Curtailment of service of a non-essential character by public utilities has begun, and is likely to increase during the winter. Jobbers' stocks are understood to be large in most lines; the lamp situation is improving, and manufacturers are beginning to accumulate stocks of standard equipment in many lines.

LAMPS.—Supply conditions are better in standard lines. The Westinghouse Lamp Company lost about 500,000 lamps in a recent Boston fire, but about seven carloads of lamps were rushed to Boston, and by to-day it was expected that the situation would be greatly improved. The policy of lamp producers of caring for customers' present needs and discouraging hoarding is bearing fruit.

PORTABLES.—Many of these were moved in the Christmas trade, though the volume of business done fell below last year. Dealers are now well stocked with modern designs for all-the-year-round business. Prices remain unchanged.

CONDUIT.—Jobbers appear to be well stocked at this time, especially in the smaller sizes. There is some reason to hope for better transportation conditions under government control of railroad service, but how much improvement is possible remains to be demonstrated.

WIRING MATERIAL.—Supplies are fairly plentiful in jobbing circles, especially in smaller and lighter products. War work dominates the industry.

WIRE AND CABLE.—Business is falling off a little in the market for the smaller sizes of wire and cable. Factory stocks are beginning to accumulate in these sizes. Deliveries are improving a little on heavier cable, and prices remain steady. The government will be in the market for such material for arsenal, shipyard and naval service for some time to come.

MOTORS.—Raw materials are a little easier in the motor factories. Shipments have not begun to improve much, however. Stocks are uncertain as to regularity of sizes. The demand continues very heavy and prices hold firmly. Even the optimists see little prospect of an early reduction in motor costs.

ATLANTA

The President's recent expression regarding the railroad problem was favorably received in this section, and a feeling of relief is felt by the business interests. The period of suspense is broken and the transportation situation clarified, at least from the viewpoint of railroad financial interests. Express and railroad embargoes have delayed the delivery of a large quantity of electrical equipment shipped from Eastern and Northern points, but even in the face of this condition an improvement is noted in the shipments of a few staples. The volume of business transacted this week is very light, owing

to the fact that the greater portion of the time will be consumed for inventory purposes.

A great amount of activity is being centered at South Florence (Muscle Shoals), Ala., the site of the government nitrate plant. Approximately \$30,000,000 will be spent at this point, and a large electrical supply business is anticipated. The labor situation at present is fairly stable, with the exception of the conditions existing at Gulfport, Miss. The cutting of wires between Pass Christian and Orange Springs prevented the Gulfport and Mississippi Coast Traction Company from serving these points temporarily.

Sales ardor has been somewhat dampened in this section owing to the very acute fuel situation and protracted drought. A number of industrial plants have had to shut down for various periods, and a few central stations suffered power curtailment on account of the fuel shortage. Decreasing water reserve at hydroelectric plants operated by the Southern Power Company, Georgia Railway & Power Company, Columbus Power Company and Central Georgia Power Company has developed into a curtailment and temporary shut-down of customers served by some of the above companies. It is reported that the shortage of both fuel and water has compelled the Central Georgia Power Company, Macon, Ga., to curtail its service to six hours per day. Lack of water at its Tallulah Falls (Ga.) plant compelled the Georgia Railway & Power Company to shut down 150 of its hydroelectric power customers twenty-four hours last week. Essential industries, such as municipal plants, fire pumps and plants working on government war orders, were permitted to operate.

LAMPS.—The trade has received notice of an advance of approximately 10 per cent in price on standard Gem and Mazda lamps to take effect Jan. 1.

RUBBER-COVERED WIRE.—A large quantity of No. 8 down to No. 4/0 solid has been purchased this week from local stocks for steel interests in the Birmingham district, and it is reported that options have been secured on stock replacements now en route. Local stocks are much lower than last week.

SEATTLE

The Pacific Northwest's first war Christmas established a record for holiday trade. However, the effect of the war was shown in buying. The greatest demand was for practical gifts, and electrical dealers generally agree that the sales of Christmas gifts along electrical lines, such as irons, percolators, toasters, stoves, lamps and sewing machines, has never been equaled. However, the usual slump in both retail and wholesale business following a holiday is now being experienced. This slump, of course, pertains particularly to sales of energy-consuming devices by wholesaler to retailer and then to customer.

The volume of business at shipyards and industrial plants was nearly as large as preceding weeks, but sales to mills and camps decreased appreciably, the latter owing to inclement weather and partial Christmas shutdowns.

Stocks of energy-consuming devices are very low owing to the heavy drain preceding the holidays. Dealers are hastening to replenish these stocks, fearing they may be placed on the non-essential list. Shortages of certain kinds of wire, heavy motors, conduits, etc., still obtain.

Reports from three large Northwest cities indicate a noticeable increase in the construction of fireproof buildings. This increase has not been especially noticeable in Seattle. During the past week orders were received from Washington for the erection of additional cantonment buildings at Vancouver, Wash., also at the mouth of the Columbia River, in addition to those recently erected at Forts Stevens, Columbia and Canby, in Oregon. Retailers report a noticeable increase in the sales of fixtures and wiring devices, this being aside from pick-up work at various cantonments.

The erection of a gigantic steel and pig-iron manufacturing plant on Puget Sound is vouched for by the authorities, who assert that construction will commence as soon as permission to buy necessary machinery and equipment is obtained from the General Defense Board. The reported initial units of the plant will cost \$9,000,000 and the fully completed project approximately \$25,000,000. The establishment of the plant will mark the beginning of the greatest period of

industrial development the Northwest has ever known and will presage the location of numerous industries utilizing steel as raw material.

Recently contracts for twenty steel steamships of 8800 tons capacity, to cost approximately \$40,000,000, were awarded to Portland shipbuilders by the United States Shipping Board. These are the first contracts granted the steel shipyards in Portland.

The freight situation is still in a chaotic condition, but recently, as the result of a conference between the railroad and steamship lines, an arrangement has been made which, it is believed, will relieve the congestion of Oriental freight.

SAN FRANCISCO

Christmas trade in electrical goods was disappointing in that it fell below expected volume. All branches of the electrical industry in San Francisco agree on this, and one large jobbing house estimates the volume of Christmas sales as 25 per cent below the amount expected. It is evident that purchases are being made with care. The sale of motor-driven household appliances has been very good, and the preference generally has been for labor-saving devices.

The machine shop and iron workers' strike now in effect has cut down the production of fixtures and accessories used in the electrical trade and has also temporarily closed down considerable construction work. However, government contracts are not being interfered with. Government action in taking over the railroads has had no effect on the Pacific Coast field. On being asked for an opinion on this point some of those who order large freight consignments stated that if any changes occur as a result of this action they are most likely to be beneficial. Because of the time allowance which Pacific Coast dealers are accustomed to make on Eastern orders, the time in transit is a smaller factor in delivery quotations than in the case of Eastern cities. Only recently have delays in transit been added to factory delays in making delivery quotations, and it is hoped that traffic plans as revised under government supervision may improve this condition.

Contractors continue to find fairly good business in industrial work and on construction contracts in interior towns. Shipbuilding activity is calling for a constant supply of materials, but local jobbers are concerned over the announcement that the United States Shipping Board plans to place orders with manufacturers. There is a question as to whether this plan would be at all feasible on the Pacific Coast.

Applications for rate increases have been filed with the railroad commission by several of the larger light and power companies, and pending decisions on these questions extension of generating plants is being limited to the actual necessity to supply present demands. In fact, some important developments have been stopped because of high prices of labor and equipment until some corresponding rate adjustment is probable.

Credits and collections are in good shape. Special care is usually exercised as books are opened for the new year, but collections have been good and there is no reason for drawing credits tighter.

LAMPS.—While not supplying the demand, manufacturers and jobbers are taking care of customers' actual needs. There have been heavy orders placed recently because of the announced increase in retail price, which took effect on Jan. 1. The demand for carbon lamps has been heavier because of the heavy industrial demand. For example, one large San Francisco plant has an average of several hundred lamps a week required to supply breakage alone.

CONDUIT.—Galvanized conduit stocks continue in bad shape. No price changes have occurred recently, but there is some anticipation of a rise in the near future.

GLASS INSULATORS.—For telephone and telegraph lines glass insulators are expected to increase in price again in January. There was a 10 per cent increase in price on this line in December. Stocks are fair to good, but deliveries are very bad.

INSULATED WIRE.—Both weatherproof and rubber-covered have shown a tendency to decrease in price, but stocks are still in poor condition.

Current Prices of Electrical Supplies

NEW YORK AND CHICAGO QUOTATIONS

The prices quoted are those prevailing in standard packages or specified lots on apparatus and appliances in Eastern and Middle West markets at the beginning of business on Monday of this week. They are in all cases the net prices or prices subject to discounts from standard lists of contractors, central stations, dealers and others engaged in the resale of such goods.

Prices in Southern and other nearby markets will rule about the same as those in the Middle West, although slight modifications to cover increased freight and local demands should be expected. In the Far West and on the Pacific Coast the prevailing prices are naturally higher, covering as they must increased freight and the necessity of larger stocks with increased interest and warehouse charges on account of the distances from sources of supply, infrequent turnover of stock and uncertainty as to delivery of goods in transit. Moreover, the Far West presents a wide variation in demand due to a small population spread over a wide area in agricultural and mining communities, as contrasted with the denser population of the East and Middle West, their nearness to the source of supply, the more frequent turnover in stocks and the constant demands which arise in industrial centers.

The variation in prices may be due to the difference in grade of products made by different manufacturers, to local conditions, or to both.

NEW APPARATUS & APPLIANCES

A Record of Latest Developments and Improvements in Manufacturers' Products Used in the Electrical Field

Plural Plug Socket

The Central Telephone & Electric Company of St. Louis, Mo., is distributing the plural plug socket shown herewith. The device has a hard-rubber composition covering which has a

PERMITS USE OF A SHADE

highly polished finish of black. By use of this appliance the lamp is left in the original position and the use of a shade is permitted.

Testing Device for Automobiles

A testing device developed to facilitate the testing and adjusting of the Ford coil unit and for testing automobile lamps of any candlepower or voltage, electric horns, spark plugs, for finding short circuits, grounds, etc., and for starting Ford engines in cold weather, has recently been put on the market by the Jefferson Electric Manufacturing Company of Chicago. One of the most important features of this tester is the fact that it tests the Ford coil unit under alternating current. The Ford coil is wound for and operates in actual service under alternating current.

The No. 28 tester is designed for use with an alternating-current lighting circuit, while the No. 30 tester is identical in every respect with the No. 28, with the exception that it is designed for use where alternating current is not available and receives its energy from a 6-volt storage battery or four dry cells. The tester is assembled in a highly polished mahogany case. All metal parts

FORD UNIT AND COMBINATION TESTER

ished mahogany case. All metal parts are heavily nicked, presenting a very handsome appearance. The No. 28 is equipped with an extension cord and plug so as to attach it conveniently to any alternating-current lighting circuit.

John F. Godfrey of Elkhart, Ind., has developed a method of unloading coal adapted from the hay carrier device. A bucket of 1-ton capacity is used, which is dropped into a pit at the side of the railroad track and filled from a chute which receives the coal from the hopper bottom of the car. The bucket is hauled up an inclined track, being supplied with trunnion rollers at each side which operate upon the track, and is lowered upon the top of the pile or bin. A trigger releases the bottom of

Coal-Handling Device

The bucket and the weight of the coal causes the bucket to empty, when the spring bottom immediately closes and is ready for another load. In order to get the bucket back to the starting point a double-drum arrangement and a double pulley on the carrier are used. This device has a capacity of unloading about three cars in eight hours.

TWO-WAY REVERSIBLE CARRIER

Socket and Plug

A new General Electric Company wiring device consists of a multi-catch pull socket and swivel attaching plug with current tap. This device can be screwed into a socket and an electrical portable such as fan motor, piano lamp, etc., attached by means of a current tap without the loss of the light in the outlet.

Cable Junction Box

A cable junction box specially designed for electric railway service by the Standard Underground Cable Company of Pittsburgh, Pa., is shown in the illustration. Where feeder circuits are installed underground use of this box makes possible the disconnecting and sectionalizing of different parts of the circuit while alive by simply opening one or more of the quick-break knife switches. The box is mounted on the wall of the manhole and is rendered waterproof by means of liberal gaskets at all points. The cables enter the box through nipples which are mechanically connected to the lead cable sheath by a wiped soldered joint. The main feeder cable passes into the box through the nipples shown in the illustration at the right-hand end and at the lower left-hand corner. The nipple shown at the upper left-hand corner is for the side feed tap leading to the trolley wire.

The box is designed for use with main feeder cables up to 2,000,000 circ. mil. and for side tap feeders up to 500,000 circ. mil. The two quick-break switches in the main feeder circuit each have a current-carrying capacity of 1000 amp. and that in the side tap circuit a capacity of 400 amp. All live parts in the box are mounted on non-inflammable insulating material and separated by ample air gaps.

A very important advantage in the design of this junction box is the patented bimetallic nipple. The rigid portion of this nipple is brass and the malleable portion lead. The wiped joint is therefore made between the lead of the nipple and that in the cable sheath, which method requires much less heat and less skill than in making a similar joint between brass and lead. The nipple is also designed to permit all cable connections to be made away from the box where there is more room

FOR ELECTRIC RAILWAY SERVICE

to work and no metal wall to conduct the heat from the parts to be joined. After all connections are made to the cable the nipple is inserted and clamped in position by means of a nut on the inside of the box.

Flexible Tubing Fastener

The Hyatt Electrical Works, Sacramento, Cal., has developed a fastener for flexible tubing such as is illustrated herewith. It is claimed that this device holds the tubing with a greater degree of positiveness, is more readily installed and takes up less space in the box than

OCCUPIES SMALL AMOUNT OF SPACE

other fasteners. The device is designed for use on $\frac{1}{8}$ -in., $\frac{7}{32}$ -in. and $\frac{1}{4}$ -in. (3.2-cm., 5.6-cm. and 6.4-cm.) sizes of tubing. When used on the $\frac{1}{4}$ -in. (6.4-cm.) size the tongue should be bent to be at right angles to the body of the clamp.

Combination Electric Dishwasher and Table

An electric dishwasher which when not in use forms a convenient kitchen table is being manufactured by the William Campbell Company of Detroit, Mich. The tank in which the washing is done is lined with tinned copper and the soap and water which performs the cleansing operation is agitated by a motor-driven paddlewheel. The cost of operation, according to the manufacturer, averages about 1 cent per hour. Three quarts (2.8 l.) of water is used for each washing operation. The outfit is mounted upon a substantial steel frame. Aluminum is used for the covering of the table top. The weight of the apparatus ready to ship is 165 lb. (74.8 kg.).

Lighting Switch

A lighting switch designed primarily for use on gasoline and electric motor cars has recently been developed by the Industrial Controller Company of Milwaukee, Wis. A single unit of the switch is shown in the accompanying illustration. The switch is of the push-and-pull type and arranged so that when the handle is pushed the circuit

FOR MOTOR CARS

is open and when it is pulled the circuit is closed.

These switches are made with a round metal cylinder or barrel, which permits of round holes being drilled or bored in the dash. The front or face plates are

furnished to correspond with the number of switches in the gang they are used with. These plates are made of heavy metal, have beveled edges and are furnished in various finishes, such as nickel, brushed brass, dull black, etc.

The handle is of metal, larger in size than those ordinarily used and designed so that it may be easily gripped. There are no fiber parts whatever used in the construction of this switch, the insulated moving contact piece being of bakelite, into which the brass parts are molded. The shaft carrying the moving contact extends clear through the switch and is supported at both ends, thereby assuring proper alignment. These switches are furnished in units or in gangs of several switches. They are also furnished for dimming the headlights, either by inserting resistance in series with the lights or by the series-parallel control method.

Receptacle Plug and Box

A heavy-service receptacle mounted in a neatly finished cast-iron box was recently placed on the market by the V. V. Fittings Company of Philadelphia. The box is waterproof, arranged with a gravity closing lid which remains closed whether the plug is in or out. The receptacle is made of

WEATHERPROOF BOX AND RECEPTACLE WITH PLUG

heavy slate thoroughly insulated from the box. The receptacle sits at an angle in order to permit an easy connection and disconnection of the plug. The binding posts for connecting wires are easily accessible, and plenty of room is allowed for wiring. The plug is made of wood so as to stand rough handling and is arranged so that the polarity cannot be reversed.

The complete outfit is made in two-pole, three-pole, and four-pole designs for 30-amp. and 60-amp. ratings. It is made especially for outdoor work for use with portable motors, coal hoists, shipyards, boat-loading machinery, moving-picture machine outlets, etc.

Electrically Heated Auto Primer

An electrically heated primer for automobiles, which both heats the fuel and atomizes it by air, has been placed upon the market by the Master Primer Company, 1523 Fort Street West, De-

troit, Mich. Connected to the carburetor, the heating coil is suspended in a small reservoir of gasoline above which is a small air vent. The outlet is controlled by a lever which operates a valve at the connection to the intake manifold. The same lever makes electrical contact and opens the air vent.

MOTOR SECURES ONLY A HEATED MIXTURE OF AIR AND GASOLINE

With the throttle of the carburetor closed, nearly all of the suction of the motor applies directly on the primer. The motor thus secures only a heated mixture of air and gasoline.

Tests made by the Detroit Testing Laboratory show that the heating coil raises the temperature of the gasoline at the rate of 14 deg. Fahr. (10 deg. C.) per second. Considering that many cars start easily at a temperature of 40 deg. Fahr. (4.4 deg. C.) and nearly all of them at 60 deg. Fahr. (15.6 deg. C.) the primer should start any car in zero weather within three to five seconds. The manufacturer states that tests in cold-storage plants at from -10 deg. to -25 deg. Fahr. (-23.3 deg. to -31.7 deg. C.) indicate that cars actually start in less than seven seconds.

Current Tap

Harvey Hubbell, Inc., of Bridgeport, Conn., is placing on the market a pull-socket current tap. The device is of the same mechanical construction as the ordinary pull socket to which has been added a plug receptacle built into the side of the body. It can be supplied with a $\frac{1}{8}$ -in., $\frac{1}{4}$ -in., $\frac{3}{8}$ -in. (3.2-cm., 6.4-cm., 9.5-cm.) or pendent cap. The flow of current to the lamp base is controlled by the pull chain. The terminals of the receptacle are continuously in circuit.

The use of this socket eliminates the

PULL-SOCKET TYPE OF CURRENT TAP

annoyance of a long cord running from a side-wall outlet. Current can be supplied directly beneath the fixture to operate the various table electrical appliances now in general use without the need of sacrificing the use of the light.

New Incorporations

THE WAALAND (MICH.) ELECTRIC LIGHT & POWER COMPANY has filed articles of incorporation with a capital stock of \$5,000.

THE HAROLD (S. D.) LIGHT & POWER COMPANY has been chartered with a capital stock of \$12,000 by P. J. Suhin, Harry Weeney and David Miller.

THE PEOPLE'S ELECTRIC & GAS COMPANY of Okmulgee has been incorporated with a capital stock of \$75,000 by A. B. De Pesse, G. Ortman and Harlan Reed.

THE MONARCH STORAGE BATTERY COMPANY of Grand Rapids, Mich., has filed articles of incorporation with the Secretary of State. The company is capitalized at \$20,000.

THE PORT ARTHUR (TEX.) TELEPHONE COMPANY has been chartered with a capital stock of \$100,000 by R. S. Shupey, J. W. Williams of Port Arthur and P. K. Higgins of Liberty, Mo.

THE WINDSOR ELECTRIC COMPANY of Steubenville, Ohio, has been incorporated with a capital stock of \$10,000 by H. M. Daugherty, R. L. Bullington, F. T. Wagenhals, E. S. Brown and R. F. Rarey.

THE CROMBIE LABORATORIES, Inc., of Port Chester, N. Y., have been incorporated with a capital stock of \$25,000 for the purpose of conducting a research laboratory for investigating chemicals and electrical properties.

THE ELECTRIC WELDING COMPANY OF AMERICA of New York, N. Y., has been incorporated with a capital stock of \$1,000,000 by W. Schenstrom, J. Kjedstad, and E. Schwarz, 415 Knickerbocker Avenue, Brooklyn, N. Y.

THE WHITNEY-MCNEILL ELECTRIC COMPANY of Augusta, Ga., has been chartered with a capital stock of \$6,000 to manufacture and deal in electrical fixtures. The incorporators are: J. B. Whitney and Joseph B. McNeill.

THE A. & C. MANUFACTURING COMPANY of Yonkers, N. Y., has been chartered with a capital stock of \$9,000 by E. J. and C. R. Abraham of Yonkers. The company proposes to manufacture electrical and gas appliances.

SHAPIRO & ARONSON of New York, N. Y., have filed articles of incorporation with a capital stock of \$250,000, for the purpose of manufacturing gas and electrical fixtures. The incorporators are: D. Shapiro, I. Kaplan and J. Pecker, 1890 Douglass Street, Brooklyn, N. Y.

THE WRIGHTSTOWN UTILITIES CORPORATION of Asbury Park, N. J., has been incorporated with a capital stock of \$25,000 to generate and distribute electricity, etc. The incorporators are: A. F. Cottrell, J. P. Watson and J. C. English, all of Asbury Park.

THE AUTOMOBILE ELECTRIC EQUIPMENT COMPANY of Wilmington, Del., has been incorporated by C. L. Rimlinger, M. M. Clancy and C. M. Enger of Wilmington, Del. The company is capitalized at \$100,000 and proposes to manufacture and install electric storage batteries.

THE CARLSBAD (N. M.) LIGHT & POWER COMPANY has been incorporated with a capital stock of \$150,000 to construct and operate an electric-light plant in Carlsbad. The incorporators are: Mary E. Tansell of Olympia, Wash.; Herbert W. Tansell and Helen S. Tansell of Carlsbad.

THE ELECTRIC FARM & LIGHTING POWER COMPANY of Antigo, Wis., has been incorporated by R. P. Brown, John H. Walechka and J. T. Brown. The company is capitalized at \$25,000 and proposes to manufacture individual or isolated light and power plants and systems and other electrical equipment.

THE DODD WILLIAM MANUFACTURING COMPANY of Jersey City has been incorporated with a capital stock of \$250,000 by Josiah D. Grummon, of New York, N. Y.; Charles E. Corbin of Rahway, and Edw. A. Markley of Jersey City. The company proposes to manufacture mechanical and electrical appliances.

THE ROYALTY PRODUCTION COMPANY has filed articles of incorporation under the laws of the State of Delaware with a capital stock of \$500,000. The company proposes to acquire patents for exploitation of an electrical device to increase the production of oil, etc. The incorporators are: F. D. Buck, M. L. Horty and J. D. Frock, all of Wilmington, Del.

THE PAN-AMERICAN WIRELESS TELEGRAPH & TELEPHONE COMPANY has been incorporated with a capital stock of \$50,000, with no par value, by interests connected with the Marconi Wireless Telegraph company for the purpose of extending the activities of the latter company. The officers are: John W. Griegs, chairman of board; Edward J. Mally, president; Washington Dodge, vice-president; C. J. Boss, secretary, and John Bottomley, treasurer.

Trade Notes

THE TRUMBULL ELECTRIC MANUFACTURING COMPANY, Plainville, Conn., has been elected to membership in the Rice Leaders of the World Association.

MAGGOVERN & COMPANY of New York City have increased their capital from \$150,000 to \$200,000. The growth of the company's business has been phenomenal.

THE ESTERLINE COMPANY of Indianapolis, Ind., announces the removal of the offices of James G. Biddle & Company, representatives of the New York territory of the Esterline Company, from 90 West Street to 15 Park Row.

FRED R. FARMER succeeded Frank S. Beardslee as president of the Beardslee Chandelier Manufacturing Company on Jan. 1. Mr. Beardslee remains with the company as chairman of the board of directors. In the past year Mr. Farmer has been sales manager of the Gibson Company, Indianapolis, Ind.

THE INTERNATIONAL SIGNAL COMPANY, Brooklyn, is the title of what was formerly the National Electric Signaling Company, the receivership of which has been amicably adjusted and closed. The International company will continue the manufacture and operation of radio-telegraph and radio-telephone apparatus under patent rights of the original company.

A. H. MEYER has been appointed general manager of the Bryan-Marsh Lamp Division, Chicago. Upon graduation from the University of Nebraska in electrical engineering in 1909 he was employed in construction work for a few months, after which he became manager of city sales at the Chicago office of the Bryan-Marsh Company, with which company he has been continuously since that time.

THE BENJAMIN ELECTRIC MANUFACTURING COMPANY of New York City on Feb. 1 will remove from 114 Liberty Street to 243 and 245 West Seventeenth Street. The company will occupy the store and basement, which runs through the block to Eighteenth Street. The new quarters will afford ten times the room the company now occupies and it is arranging to carry that much increased stock of its specialties for the jobbing trade.

THE CROCKER-WHEELER COMPANY of Amper, N. J., to meet unusual conditions incident to the war through Dr. Schuyler S. Wheeler, president, on Dec. 27 announced a bonus under which its employees will receive not less than 10 per cent of their wages since Oct. 1, 1917, and during the coming year. All employees receiving less than \$2,500 yearly will benefit, and those who have been in the employ of the company for more than a year will receive 12 per cent of their earnings.

THE CHICAGO FUSE MANUFACTURING COMPANY announces that it has purchased the entire renewable-fuse business of the Multi Refillable Fuse Company, makers of the well-known line of multi-refillable fuses. This transaction includes the conveyance of all merchandise, materials, machinery, tools, designs, patents, good will and unfilled orders, and hereafter these fuses will be manufactured and marketed solely by the Chicago Fuse Manufacturing Company under its trade name "Union." The Chicago Fuse Manufacturing Company will still continue with its line of non-refillable fuses, thereby being in a position to furnish either type of fuse as desired by the trade.

C. T. McDONALD, president and manager of the Multi Refillable Fuse Company, announces that he has disposed of his interest in that company, and after Jan. 1 will devote his entire attention to the Multi Electrical Manufacturing Company at 703 Fulton Street, Chicago. The new company will manufacture and market a complete line of slate base cut-outs and fittings, wire bushings and conduit fittings under the trade name "Multi." Mr. McDonald has been associated with the manufacture of these and kindred electrical supplies during the last fifteen years, and announces that it will be the policy of this company to merchandise its product through agents in different communities.

Trade Publications

SOCKETS. "Quick Catch" sockets are illustrated and described in a circular issued by Harvey Hubbell, Inc., Bridgeport, Conn.

RADIATOR.—The Willis Manufacturing Company of Cleveland, Ohio, is distributing a folder descriptive of its portable electric nitrogen radiator.

PRIMER.—The Master Primer Company of Detroit, Mich., has prepared a folder descriptive of its Master primer with an electrically heated vaporizer.

VACUUM CLEANERS.—The Wise McClung Manufacturing Company of New Philadelphia, Ohio, has issued a folder on its American electric vacuum cleaner.

REHANDLING BUCKET.—The Blaw-Knox Company of Pittsburgh, Pa., has prepared a folder giving information regarding its "Blaw" speedster rehandling bucket.

TOGGLE SNAP SWITCHES.—Harvey Hubbell, Inc., of Bridgeport, Conn., has prepared bulletin No. 16-2, descriptive of its Hubbell surface-type toggle snap switch.

STEAM TURBINE LUBRICATION.—The Moore Steam Turbine Corporation of Wellsville, N. Y., has issued a bulletin on the subject of correct steam turbine lubrication.

POWER-PLANT EQUIPMENT.—Bulletin No. 66, descriptive of power-plant equipment for immediate shipment, has been prepared by the Ross Power Equipment Company, Merchants' Bank Building, Indianapolis, Ind. This bulletin, which is dated Dec. 15, 1917, lists electrical equipment, steam units and miscellaneous items.

THE TRUMBULL ELECTRIC MANUFACTURING COMPANY of Plainville, Conn., has just distributed a new bulletin covering its "safety service" knife-switch line and a line of inclosed switches that are not externally operated. The line is complete, covering all general requirements. The two features that are especially emphasized in the design of the "safety service" are, first, that the box cannot be opened until the switch is disconnected, and, second, that when opened the switch cannot be connected until the cover is closed. With these two features no operator at any time can come in contact with a live closed switch.

CABINETS.—The Benjamin Electric Manufacturing Company of Chicago has just prepared its bulletin No. R-2, descriptive of Benjamin-Starrett cabinets. This bulletin is a necessary supplement, it is said, to the Benjamin-Starrett panelboard catalog, S-2. The listings in that book include cabinets, but only so far as certain combination list prices of panelboards complete with cabinets are concerned. Numerous listings in catalog S-2 are for panels only. It was, therefore, left to this bulletin to describe and illustrate cabinets alone for "RA," "SA," "SB," "RG" and "SG" panels and "R" and "S" standard panelboards. Diagrams, illustrations and full data on how the panels are mounted, together with a description of the special mounting plates, are given.

STEEL POLES.—The Bates Expanded Steel Truss Company, 208 South La Salle Street, Chicago, is distributing its 1918 edition "Steel Pole Treatise." This volume contains various valuable data and simplified formulas for steel-pole work. The latter portion of the treatise is devoted to simplified mathematical formulas for computing various pole-line stresses, information that should be in the hands of every construction engineer. Valuable wire data to be used in connection with the mathematical formulas and various other purposes are included. Precise dimensions of original sections before they are sheared and expanded into the poles, together with compilations of the strength of these beams unexpanded when used as beams, girders and columns, are given. A list of users of Bates poles is also included. An interesting article regarding 2500 Bates steel poles recently furnished the city of Chicago is included, as is a brief description of the company's Italian undertaking where a plant at Savona, Italy, is now being built. The index is as follows: "Trolley Poles and Fittings," "Lighting Poles and Fittings," "Combination Structures," "Method of Manufacture," "Tests," "Bates 'H' Sections," "Simplified Mathematical Formulas," "Comparison of Bates Expanded Steel Poles and Tubular Steel Poles," "Prices of Poles," "Pole Fixtures and Fittings," "Wood Pole Decay," "Pole Capacities," "Modern Pole Line Sense," "Concrete Setting," "Valuable Wire Data," "Resultant Force," "A Few Users of Bates Poles," "Street Signs," "Pole Climbers," "Outdoor Substations," "Inquiry, Suggestions," etc.

New England States

PORTSMOUTH, N. H.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until Jan. 14 for furnishing one electric freight elevator of 2 tons capacity for building No. 45 at the Navy yard, Portsmouth, N. H. Drawings and specifications (No. 2730) may be obtained on application to the above bureau or to the commandant of the navy yard named.

LYNN, MASS.—The General Electric Company has begun work on the construction of its proposed new factory buildings at West Lynn, two of which will be one and two stories, about 25 ft. by 50 ft., and a new administration building, about 70 ft. by 340 ft.

Middle Atlantic States

ANDOVER, N. Y.—Plans are being considered by the town officials of Andover for the construction of a municipal electric-lighting plant.

BUFFALO, N. Y.—Plans are being prepared by the New York Central Railroad Company for the construction of a new power house in Curtiss Street, to cost about \$20,000.

HORNELL, N. Y.—The City Council has applied to the Public Service Commission for permission to construct and operate a municipal electric-light plant in Hornell.

MONTOUR FALLS, N. Y.—The Shepard Electric Crane & Hoist Company has filed a notice of increase in capital stock with the Public Service Commission from \$500,000 to \$1,000,000 for expansion.

NEW YORK, N. Y.—Contract has been awarded by the E. Greenbaum Company, 349 East 103d Street, New York City, to the W. K. Moran Company, 405 Lexington Avenue, for the installation of new power equipment and a new heating system at its packing houses at 320 East 103d Street.

NEW YORK, N. Y.—Plans have been filed and contract awarded by the New York Edison Company for the erection of a one-story addition to its transformer station on Park Avenue, near 149th Street. Plans have also been prepared for the erection of a one-story storehouse at the same location. The Louis Weber Building Company, 171 Madison Avenue, has the contract.

NEW YORK, N. Y.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until Jan. 14 for a new electric-lighting system for the extension of machine shop building, No. 128, at the Navy Yard, New York, N. Y. Drawings and specifications (No. 2728) may be obtained on application to the above bureau or the commandant of the navy yard named.

NAGARA FALLS, N. Y.—To assure the adequate supply of electric power for establishments engaged in war work at Niagara Falls and Buffalo, the United States government has requisitioned the energy generated and distributed by the Niagara Falls Power Company, the Hydraulic Power Company of Niagara Falls and the Cliff Electrical Distributing Company. It is not expected that operation of mills will be affected materially by the new order as readjustment of the power supply has been arranged previously by the representatives of the War Industries Board.

RIVERHEAD, N. Y.—The Long Island Lighting Company of Northport is reported to be negotiating for the purchase of the property of the Riverhead Electric Light Company.

SOUTHAMPTON, N. Y.—The stockholders of the Suffolk, Light, Heat & Power Company have voted to sell the plant and holdings to the Long Island Lighting Company of Northport, which has also recently acquired the electric-light plants at Sayville, Islip, Babylon and Farmingdale.

SYRACUSE, N. Y.—The New York Central Railroad Company has awarded contract for the erection of a new power house (one-story, 25 ft. by 35 ft.) at its West Side yards, to W. M. Ballard, Oneida, N. Y.

CAMDEN, N. J.—An appropriation of \$110,400 as provided for in the annual budget for 1918, including \$13,900 for the Electrical Bureau and \$96,500 for electric lighting, has been approved by the City Council.

GLOUCESTER, N. J.—Plans have been prepared by the Bell Telephone Company, 1230 Arch Street, Philadelphia, Pa., for the erection of a new exchange plant in Gloucester.

MORRISTOWN, N. J.—The Board of Public Utility Commissioners has granted the Morris County Traction Company permission to issue \$1,179,000 for extensions and improvements to its system.

Construction

News of Projects, Plans, Bids and Contracts. Notes on Work Under Way

MORRISTOWN, N. J.—The Morris & Somerset Electric Company, 20 South Street, has been awarded contract for supplying electricity to operate the proposed new aluminum bronze works, to be erected in Morristown by Charles Butters of Oakland, Cal.

NEWARK, N. J.—The Public Utility Commission has approved the application of the Public Service Railway Company for permission to issue \$1,250,000 in capital stock, the proceeds to be used for plant extensions.

NEWARK, N. J.—Permission has been granted the New York Telephone Company by the Township Committee of Hillside, near Newark, to erect poles in Myrtle Avenue, to provide for extensions to its system in the Hillside district.

NEWARK, N. J.—Bids will be received by the Board of Freeholders for the installation of new electric-lighting and power wiring in the laundry building at the Essex County Hospital at Overbrook. The board is also considering plans for improvements to the electric-lighting system and the installation of new boilers at the hospital.

TRENTON, N. J.—The City Commission is considering plans for improvements to the electric street-lighting system, including extensions in Nassau, Dexter and Vine Streets and Phillips Avenue, in the North Trenton district.

TRENTON, N. J.—The Mercer County Board of Freeholders has awarded contract for lighting the Lee and Olden Avenues, Chambers and Southard Streets and the Perdicaris Place bridges to the Public Service Corporation for a period of five years.

BRADFORD, PA.—Plans have been filed by the Kendall Refining Company for the erection of a new two-story power house, 40 ft. by 75 ft., at its works in the East Bradford district. Contract has been awarded to W. I. Uhrh, 574 East Main Street, Bradford.

ERIE, PA.—Plans have been filed by the General Electric Company for the construction of a new power house at its local works, for which contract has been awarded to Henry Sherk, Twelfth and Sassafras Streets, Erie.

ERIE, PA.—Three large housing projects to cost approximately \$6,000,000, it is reported, are under consideration by the American Brake Shoe & Foundry Company, the General Electric Company and the Erie Forge Company to provide accommodations for their employees.

NANTICOKE, PA.—Plans are being prepared for the construction of several extensions to the State Hospital at Nanticoke, including a new one-story power house. McCormick & French, Second National Bank Building, Philadelphia, Pa., are architects; Dr. E. D. Meyer, West Washington Street, Nanticoke, is superintendent.

NORRISTOWN, PA.—Improvements are being made to the local system of the United Telephone & Telegraph Company, including the installation of a new switchboard.

PHILADELPHIA, PA.—Plans are being prepared by Shane Brothers & Wilson, Bourse Building, for the construction of a new one-story power house, about 35 ft. by 40 ft., at its plant at Sixty-third and Market Streets. J. M. Whitham of Philadelphia, Pa., is architect.

POTTSVILLE, PA.—The Pottsville Union Traction Company has filed notice with the Public Service Commission of an issue of \$10,000 in bonds for extensions and improvements to its system.

POTTSVILLE, PA.—Notice has been filed with the Public Service Commission by the Eastern Pennsylvania Light, Heat & Power Company of an issue of \$10,500 in bonds, the proceeds to be used for improvements.

READING, PA.—The Public Service Commission has granted the Reading Transit & Light Company permission to arrange for an appropriation of \$150,000 for extensions and improvements to its system.

WHITE HAVEN, PA.—Plans have been prepared by the Wilmot Engineering Company of Hazleton for extensions to its plant at White Haven, to include a machine shop, pattern shop and power station. The company manufactures iron and steel castings, coal mining machinery, breakers, etc. George W. Wilmot is president.

WILKES-BARRE, PA.—The main power station of the Wilkes-Barre Company on North River Street at the city line is being enlarged to provide space for new equipment, including new switchboard, two boilers of 600 hp. each and a new 5000-kw. turbine. The company will also erect a new high-tension transmission line from Wilkes-Barre to Ludlow and vicinity. This line will supply energy to the colliery of the Quinn Coal Company and other industries along the line.

BALTIMORE, MD.—Plans are being prepared by Gardner & Lindberg, of Chicago, Ill., for the erection of a new power house at the works of Corkran, Hill & Company on Sixth Street, near Wilkens Avenue. The office of the company is located at 221 South Howard Street.

BALTIMORE, MD.—Plans have been filed by the Bartlett-Hayward Company, Scott and McHenry Streets, for the construction of a new transformer house at Ramsay and Poppleton Streets. Contract has been awarded to Morrow Brothers, Fidelity Building, Baltimore, Md.

WASHINGTON, D. C.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until Jan. 21 for the installation of radio towers and tank at Bartaria Bay, La., to cost about \$35,000. Further information may be obtained at the above bureau.

WASHINGTON, D. C.—Plans are being prepared by McKenzie, Voorhees & Gmelin, 1123 Broadway, New York, N. Y., for the construction of a new telephone building for the Chesapeake & Potomac Telephone Company at Thirteenth and G Streets, N. W. The cost is estimated at about \$800,000.

North Central States

CLEVELAND, OHIO.—The New York Central Railroad Company is planning to erect a power house, 40 ft. by 79 ft., in Cleveland. New equipment, including generators, motors, etc., will be purchased. For further information address W. Brahan, East Third and St. Clair Streets.

TOLEDO, OHIO.—The City Council has granted the Mutual Heating & Lighting Company a franchise to lay conduits in Michigan Street, from Jackson to Lafayette Street.

JACKSON, KY.—The power plant of the Jackson Light & Ice Company was recently damaged by fire. The boilers alone escaped injury.

CABERY, ILL.—Bonds to the amount of \$4,500 have been voted for the installation of an electric-lighting plant.

HOMER, ILL.—The property of the Homer Electric Light & Power Company has been purchased by J. M. Copel and T. E. Hughes of Champaign. The plant also furnishes electrical service in Sidney.

JOLIET, ILL.—The Chicago & Joliet Electric Railway Company is contemplating the construction of two substations, to cost about \$50,000. One will be erected at Osgood and St. Louis Streets, and the other at Delwood Park.

MATTOON, ILL.—The Central Illinois Public Service Company has petitioned the Illinois Public Utilities Commission to abandon heating plants operated by the company in Charleston, Virden, Carrollton, White Hall and Moweaqua. The petition is based upon the high cost and scarcity of coal and also the increased cost of other materials, making the heating service in the towns mentioned unprofitable.

WYOMING, ILL.—The Illinois Public Utilities Commission has granted the Public Service Company of Northern Illinois authority to purchase and operate the property of the Stark County Electric Company.

AMHERST, WIS.—The Amherst Electric Service Company, it is reported, contemplates extending its electric transmission line from Amherst to Amherst Junction.

IOLA, WIS.—The Iola Light, Power & Manufacturing Company, recently incorporated with a capital stock of \$25,000, proposes to construct and operate a hydroelectric and auxiliary steam generating plant, saw and planing mill and other industries. Edwin J. George, Bertha and Erna Nehls are the incorporators.

STEVENS POINT, WIS.—Contract has been awarded by the Jackson Milling Company to the Allis-Chalmers Manufacturing Company of Milwaukee, for equipment for a hydroelectric power plant to be erected on the Wisconsin River at Stevens Point. The equipment will consist of six 950-hp. vertical open-flue hydraulic turbines directly connected to six 800-kva., alternating-current motors with governors, and two 200-kw. motor generator sets. The cost of the plant complete is estimated at \$500,000.

CEDAR RAPIDS, IOWA—The Board of Railroad Commissioners has granted the Iowa Railway & Light Company of Cedar Rapids a franchise to construct and operate an electric transmission line along certain roads in Benton County for the transmission of electricity for lamps, heaters and motors.

CEDAR RAPIDS, IOWA—The Hubbard Ice Company is contemplating improvements to its ice plants at 1132 North First Street West and 319 Eighth Street West, at a cost from \$8,000 to \$10,000. The company, it is reported, would like to receive bids on electric wiring. Rufus Lee, 1132 North First Street West, is manager.

EDDYVILLE, IOWA—The City Council is considering calling an election to submit the proposal to issue \$7,000 or \$8,000 in bonds for improvements to the municipal electric-lighting system.

ST. LOUIS, MO.—The Laclede Gas Light Company is planning to establish a plant, at a cost of \$100,000, to repair meters and motor cars.

ST. LOUIS, MO.—An ordinance has been introduced by the Board of Aldermen requiring the Union Electric Light & Power Company to replace all 32-cp. lamps with 60-watt Mazda lamps.

ST. LOUIS, MO.—The J. C. Bullis Manufacturing Company, 1122 South Twelfth Street, it is reported, is taking bids on two 80-hp., horizontal return boilers, boiler feed pump, steam heating, electric wiring and sprinkler system for a one-story building, 218 ft. by 391 ft., to be erected at Penrose, Geraldine and Brown Avenues. William Levy, Wright Building, is architect. The Flad & Humphrey Engineering Company, Chemical Building, is mechanical engineer.

FALLS CITY, NEB.—At an election to be held Jan. 15 the proposal to issue \$60,000 in bonds for improvements to the municipal electric-light plant and \$15,000 for the water works system will be submitted to the voters. E. M. Stevens, Ridge Arcade, Kansas City, Mo., is engineer.

OMAHA, NEB.—The Nebraska Service Station has awarded general contract for the construction of an auto service station to Alexander Beck, Keeline Bank Building. The company is receiving bids for electric wiring, heating and plumbing. The cost of the building is estimated at \$32,000.

BURNS, KAN.—At an election held Dec. 27 the proposal to issue \$10,000 in bonds, the proceeds to be used for the installation of a municipal electric-light plant, was carried.

FORD, KAN.—Bids will be received by the board of education, Ford, until Jan. 8 for the construction of a rural high school building, including steam heating, electric wiring, plumbing, etc. The cost of the building is estimated at \$20,000.

GARFIELD, KAN.—Local business men have entered into a contract with the City Council of Larned for electricity from the municipal electric plant. The local company's transmission line will connect with the Larned system at the State Hospital for the Insane, 3 miles west of Larned, where the municipality furnishes electricity for the State buildings.

WICHITA, KAN.—Contract has been awarded by the Wichita-Walnut Valley Interurban Company for the construction of its proposed interurban railway to the Scott Construction Company of St. Louis, Mo. The line will extend from Wichita to Andover, thence to El Dorado and to Augusta.

WICHITA, KAN.—Bids will be received at the office of the board of education, Wichita, until Jan. 14 for the construction of two six-room additions, one to the Waco Ward School at Twenty-first and Waco Avenue, the other to the Horace Mann Intermediate School at Twelfth Street and North Market Streets. Separate bids to be submitted for heating and ventilating system, plumbing and electric wiring. Copies of plans and specifications may be obtained at the office of Lorentz Schmidt, architect, Wichita, upon deposit of \$15.

Southern States

GRAPHITEVILLE, N. C.—The General Graphite Company, Jefferson Bank Building, Birmingham, Ala., it is reported, contemplates the construction of a hydroelectric plant in Graphite.

TUXEDO, N. C.—The Blue Ridge Power Company is planning to build a hydroelectric plant on the Green River, to develop from 8000 to 10,000 hp., at a cost of from \$800,000 to \$900,000. Contract for dam, 125 ft. high and 300 ft. long, has been awarded to Willard, Boggs & Company of Spartanburg, S. C., at \$100,000. Designs for power house have not yet been prepared. The plans provide for the erection of an electric trans-

mission line to connect Spartanburg, Inman, Campobello, Landrum, S. C., and Tryon and Saluda, N. C. All principal contracts, it is understood, have been placed. John A. Law of Spartanburg, S. C., is president.

COLUMBUS, MISS.—The Columbus Lumber Company is contemplating the installation of new equipment, including boilers, engines, locomotives, etc. The cost of the improvements is estimated at \$70,000. D. F. McCullough is manager.

McCOMB, MISS.—The McComb & Magnolia Railway & Light Company is planning to build about 8 miles of track during 1913, to connect Summit, McComb, Fernwood and Magnolia.

WIGGINS, MISS.—The City Council has engaged Xavier A. Kramer, consulting engineer, Magnolia, to prepare plans for improvements to the electric-light plant and water-works system.

MOUNTAIN HOME, ARK.—A company, it is understood, has been organized to develop the water power on the North Fork River in connection with the erection of large smelters to work up large deposits of zinc and iron ores in north Arkansas and South Missouri. To meet the requirements of the proposed smelters it will be necessary to develop 3000 hp. E. N. Sanderson, 60 Broadway, New York, president of the Federal Light & Traction Company of Springfield, Mo., and others, are reported interested in the project.

ARDMORE, OKLA.—Contract has been let by George H. Siedehoff Construction Company of Kansas City, general contractor, to the Dodge Electric Company of Tulsa, for electric work for the Ardmore Hotel, to be erected in Ardmore, at a cost of about \$200,000.

TIOMINY, OKLA.—The installation of an electric lighting system is under consideration by the City Council.

PAULS VALLEY, OKLA.—The City Council is considering calling an election to vote on the proposal to issue bonds for improvements to electric-lighting system and water works.

BELTON, TEX.—The property of the Southwestern Traction Company, including the interurban line which runs between Belton and Temple, has been sold under the order of the United States Court, the purchaser being F. W. Downs of Temple, for \$170,000, including mortgage bonds. The company, it is stated, will be reorganized and important improvements made to the property.

FORT WORTH, TEX.—The North Fort Worth Ice & Cold Storage Company is planning to install additional machinery in its ice plant at North Fort Worth, increasing the output by one-third.

GREENVILLE, TEX.—The Mineral Heights Street Railway Company is contemplating changing its system from overhead trolley to gasoline motive power.

MARFA, TEX.—The Marfa Electric & Ice Company is planning extensions to its light and power plant, including the installation of new equipment. The company, which has also been granted a franchise to supply the city with water, will sink a number of wells and install pumps.

NAGODOCHES, TEX.—The City Council is planning extensions to the municipal electric-light and power plant, including the installation of a 300-kw., 2300-volt steam turbo-generator set, at a cost of about \$14,000.

ORANGE, TEX.—The International Shipbuilding Company is planning to install a large electric carrying and mono-rail system in its local shipbuilding yards.

Pacific and Mountain States

OLYMPIA, WASH.—The Olympia Light & Power Company is installing a new 400-kw. alternating-current generator in its power plant.

OLYMPIA, WASH.—Owing to bids exceeding the funds appropriated for the construction of a new cottage and power plant at the State Training School for Girls at Grand Mound, the Board of Control has decided to drop the project for the present. The bids exceeded the appropriation by more than \$12,000.

SEATTLE, WASH.—A bill has been passed by the City Council providing for an increase from \$3,000,000 to \$5,000,000 of the lighting fund utility bond issue for the purchase of a completed hydroelectric project. The bill will be an amendment to a bill passed by the Council early in 1917 directing the call of bids and an expenditure not exceeding \$3,000,000.

SEATTLE, WASH.—The engineering department of the Puget Sound Traction,

Light & Power Company is completing the installation of an additional penstock at the White River hydroelectric plant, which is about three-fourths completed. Foundations for the 16,000-kvm. generator and waterwheel have been placed. The plant when completed will cost about \$750,000.

SEATTLE, WASH.—The City Council has passed a bill appropriating \$750 to send Hugh M. Caldwell, corporation counsel, and J. D. Ross, superintendent of lighting, to Washington, D. C., in the interests of the city, to bring about the cancellation of the rights of the Skagit Power Company to the Skagit River power site. The company was given rights on this site several years ago.

SEATTLE, WASH.—The City Utilities Committee has directed A. H. Dimock, city engineer, and J. D. Ross, superintendent of lighting, to make an investigation of the power project on the Snoqualmie Forest Reserve offered to the city by the Skyomish Power Company. The project is offered to the city for \$800,000, and attention is called to the standing timber on the land, which can be disposed of while the dam is being built for \$700,000. The site is 40 miles from Seattle and, it is understood, that an impounding basin can be developed with a capacity of 200,000 acre ft., or double the storage capacity of Cedar Lake after the new masonry dam is utilized. It is estimated that 40,000 (continuous) hp. can be developed.

BROOKDALE, CAL.—The Mountain Light & Water Company of Brookdale has petitioned the State Railroad Commission for permission to discard its flat rates and install meters in the residences of its patrons.

LOS ANGELES, CAL.—Plans for the completion of the municipal power plant No. 2 in San Francisquito Canyon to develop about 25,000 hp. are under consideration by Mayor Woodman and William Mulholland, chief engineer. The cost is estimated at \$750,000.

LOS ANGELES, CAL.—The Board of Supervisors has adopted an ordinance granting the Pacific Electric Railway Company a franchise to construct and operate an electric railway on certain highways and public roads in Los Angeles County for a period of 40 years.

CARLSBAD, N. M.—The Carlsbad Light & Power Company is contemplating the installation of a steam auxiliary plant and proposes to use oil for fuel. The company would like to communicate with manufacturers and dealers in fuel oil equipment. H. Prithard is manager.

Canada

CALGARY, ALTA.—The purchase of a new automatic feed regulator, which will be required in connection with the contract to supply the Western Canada Flour Mills Company with energy is under consideration by the City Council. The cost is estimated at \$2,750 and the commissioners will recommend that it be purchased from the Westinghouse Company. The company has decided to discard its steam plant and equip its works for electrical operation and has contracted for 800 hp.

TRAIL, B. C.—The West Kootenay Power & Light Company contemplates extending its electric transmission line to the property of the Canada Copper Company at Princeton a distance of 110 miles, to furnish electricity to operate the proposed 3000-ton concentrator which the company is planning to build. Plans are now being prepared by Bradley, Bruff & La Barthe of San Francisco, Cal., for the concentrator, to cost about \$1,500,000.

BRUSSELS, ONT.—The Town Council is considering the installation of a new electric-light plant in the near future.

PARKHILL, ONT.—The Town Council is considering the installation of a hydroelectric power plant, to cost about \$12,000.

PERTH, ONT.—The municipality is considering the purchase of the local electric plant, owned by the Canadian Electric & Water Power Company. The Hydro-Electric Power Commission of Ontario is planning the erection of a 26,400-volt transmission line between Perth and Smith's Falls to supply electricity to this town. It is proposed to change over the present generating stations and distribution system from 133 cycles to 60 cycles.

PICTON, ONT.—The Hydro-Electric Power Commission of Ontario is planning to furnish electricity in the towns of Picton, Wellington and Bloomfield, Prince Edward County, by means of a 44,000-volt transmission line from Trenton. The plans provide for the erection of a substation in Picton and also a substation in Wellington to serve the latter plant and Bloomfield, and the erection of a 4000-volt transmission line from Wellington to Bloomfield.

ALABAMA LIGHT AND TRACTION ASSOCIATION. Secretary-treasurer, J. P. Ross, Birmingham Railway, Light & Power Co.

AMERICAN ASSOCIATION OF ENGINEERS. Secretary, A. H. Krom, 29 South La Salle St., Chicago. Annual meeting, May 14, 1918.

AMERICAN ELECTRIC RAILWAY ASSOCIATION. Secretary, E. B. Burritt, 8 West 40th St., New York.

AMERICAN ELECTROCHEMICAL SOCIETY. Secretary, Prof. J. W. Richards, Lehigh University, South Bethlehem, Pa.

AMERICAN INSTITUTE OF CONSULTING ENGINEERS, INC. Secretary, F. A. Molitor, 35 Nassau St., New York City. Annual meeting, Jan. 14, 1918.

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS. Secretary, F. L. Hutchinson, 33 West 39th St., New York. Board of directors meets monthly. Sections and branches in the principal electrical centers throughout the country.

AMERICAN PHYSICAL SOCIETY. Secretary, Prof. A. D. Cole, Ohio State University, Columbus, Ohio.

AMERICAN SOCIETY FOR TESTING MATERIALS. Secretary-treasurer, Edgar Marburg, University of Pennsylvania, Philadelphia.

ARKANSAS ASSOCIATION OF PUBLIC UTILITY OPERATORS. Secretary-treasurer, Roy B. Fowles, Pine Bluff, Ark.

ASSOCIATED MANUFACTURERS OF ELECTRICAL SUPPLIES. General secretary, C. E. Dustin, 30 East 42d St., New York.

ASSOCIATION OF EDISON ILLUMINATING COMPANIES. Secretary, George C. Holberton, San Francisco, Cal.

ASSOCIATION OF IRON AND STEEL ELECTRICAL ENGINEERS. Secretary, John F. Kelly, McKeesport, Pa. Annual convention, September, 1918.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS. Secretary-treasurer, Joseph A. Andreucetti, Chicago & Northwestern Railway, Chicago.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS. Secretary, W. L. Connelly, Gibson, Ind.

BRITISH COLUMBIA ASSOCIATION OF ELECTRICAL CONTRACTORS AND DEALERS. Secretary, R. B. W. Pirie, 406 Yorkshire Building, Vancouver, B. C. Annual meeting September, 1918.

CALIFORNIA ASSOCIATION OF CONTRACTORS AND DEALERS. Secretary, James W. Redpath, 505 Rialto Bldg., San Francisco, Cal.

CANADIAN ELECTRICAL ASSOCIATION, affiliated with N. E. L. A. Secretary-treasurer, M. C. Gilman, Toronto Electric Light Company.

COLORADO ELECTRIC LIGHT, POWER AND RAILWAY ASSOCIATION. Secretary-treasurer, T. F. Kennedy, 900 15th St., Denver, Col.

COMMERCIAL SECTION N. E. L. A. Secretary, F. D. Beardslee, Union Electric Light & Power Co., St. Louis, Mo.

CONNECTICUT ELECTRICAL CONTRACTORS AND DEALERS' ASSOCIATION. Secretary, George M. Chapman, Waterbury, Conn. Annual meeting, New Haven, Conn., May 1918.

EASTERN NEW YORK SECTION N. E. L. A. Assistant secretary, J. L. Hemphill, General Electric Co., Schenectady, N. Y.

ELECTRICAL MANUFACTURERS' CLUB. Secretary, Shiras Morris, Hart & Hegeman, Hartford, Conn.

ELECTRICAL SUPPLY JOBBERS' ASSOCIATION. General secretary, Franklin Overbagh, 411 South Clinton St., Chicago, Ill.

ELECTRICAL TRADES ASSOCIATION OF CANADA. Secretary, William R. Stavelly, Royal Insurance Building, Montreal, Can.

ELECTRICAL CREDIT ASSOCIATION OF THE PACIFIC COAST. Secretary, Albert E. Elliott, 502 Flatiron Building, San Francisco.

ELECTRIC POWER CLUB. Secretary, C. H. Roth, 1410 West Adams St., Chicago.

ELECTRIC VEHICLE SECTION OF THE N. E. L. A. Secretary, A. Jackson Marshall, 29 West 39th St., New York.

EMPIRE STATE GAS AND ELECTRIC ASSOCIATION. Secretary, Charles H. B. Chaplin, 29 West 39th St., New York.

FLORIDA ENGINEERING SOCIETY. Secretary, J. R. Benton, Gainesville, Fla. Annual meeting, Jacksonville, Fla., Jan. 7, 1918.

GAS, ELECTRIC AND STREET RAILWAY ASSOCIATION OF OKLAHOMA. Secretary-treasurer, L. W. W. Morrow, Norman, Okla. Annual meeting, May, 1918, Oklahoma City.

GEORGIA ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, Dan Carey, Atlanta Builders' Exchange, Atlanta, Ga. Annual meeting June, 1918, Tybee Island, Ga.

ILLINOIS ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, L. B. Van Nuys, Central Electric Co., Peoria, Ill. Annual meeting, Chicago, January, 1918.

ILLINOIS STATE ELECTRIC ASSOCIATION. Secretary, R. H. Abbott, Petersburg, Ill.

Directory of Electrical Associations

Printed in the First Issue of Each Month

ILLUMINATING ENGINEERING SOCIETY. General secretary, Clarence L. Law. Sections in New York, Philadelphia, Pittsburgh, Cleveland, Chicago and Boston.

INDIANA ELECTRIC LIGHT ASSOCIATION. Secretary, Thomas Donahue, Lafayette, Ind.

INDIANA STATE ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, George Skillman, Indianapolis, Ind.

INDUSTRIAL ELECTRIC HEATING ASSOCIATION. Secretary, Homer Kunz, Toledo Railway & Light Co., Toledo, Ohio.

INSTITUTE OF RADIO ENGINEERS. Secretary, David Sarnoff, 111 Broadway, New York.

INTERNATIONAL ASSOCIATION OF MUNICIPAL ELECTRICIANS. Secretary, C. R. George, Houston, Tex.

INTERNATIONAL ELECTROTECHNICAL COMMISSION (international body representing various national electrical engineering societies contributing to its support). General secretary, C. le Maistre, 28 Victoria St., Westminster, London, S. W., England.

IOWA ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, M. T. Humphrey, Waterloo, Iowa.

IOWA SECTION N. E. L. A. Secretary-treasurer, L. E. Caldwell, Iowa City, Iowa.

JOVIAN ORDER. Jupiter (president). Henry J. F. Strickland, Dallas, Tex.; Mercury (secretary), E. C. Bennett, Syndicate Trust Building, St. Louis, Mo.

KANSAS ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, R. M. Sutton, Wichita.

KANSAS PUBLIC SERVICE ASSOCIATION. Secretary-treasurer, W. W. Austin, Cottonwood Falls, Kan. Annual meeting, Kansas City, Kan., Oct. 17-19, 1918.

KENTUCKY ASSOCIATION OF ELECTRICAL CONTRACTORS. Secretary, F. F. Valinoti, Annual meeting, May, 1918, Louisville, Ky.

LOUISIANA ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, I. G. Marks, 323 Chartres St., New Orleans, La.

MAINE ELECTRIC ASSOCIATION. Secretary-treasurer, Walter S. Wyman, Augusta, Me.

MASSACHUSETTS ELECTRICAL CONTRACTORS AND DEALERS' ASSOCIATION. Secretary, J. E. Wilson, 263 Summer Street, Boston, Mass.

MICHIGAN SECTION N. E. L. A. Secretary, Herbert Silvester, Detroit Edison Co., Monroe, Mich.

MINNESOTA ELECTRICAL ASSOCIATION. Secretary, H. E. Young, Minneapolis General Electric Company, Minneapolis, Minn.

MINNESOTA ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, G. M. Jones, 112 South Seventh St., Minneapolis, Minn. Annual convention, January, 1918, Minneapolis.

MISSISSIPPI ELECTRIC ASSOCIATION. Affiliated with the N. E. L. A. Secretary-treasurer, W. F. Wheeler, Hattiesburg.

MISSOURI ASSOCIATION OF PUBLIC UTILITIES. Secretary-treasurer, F. D. Beardslee, Union Electric Light & Power Co., St. Louis.

MISSOURI ELECTRICAL CONTRACTORS AND DEALERS' ASSOCIATION. Secretary, A. J. Burns, 318 West Tenth St., Kansas City, Mo. Annual meeting Jan. 19, 1918.

NATIONAL ARM, PIN AND BRACKET ASSOCIATION. Secretary, J. B. Magers, Madison, Ind.

NATIONAL ASSOCIATION OF ELECTRICAL INSPECTORS. Secretary-treasurer, William L. Smith, Concord, Mass. Annual convention, New York, March, 1918.

NATIONAL ELECTRIC LIGHT ASSOCIATION. Executive secretary, T. C. Martin, 32 West 39th St., New York.

NATIONAL ELECTRICAL CONTRACTORS' ASSOCIATION OF THE UNITED STATES. Secretary, H. C. Brown, 41 Martin Building, Utica, N. Y.

NATIONAL ELECTRICAL CREDIT ASSOCIATION. Secretary, Frederic P. Vose, 1350 Marquette Building, Chicago, Ill. Annual meeting, June 1, 1918.

NATIONAL FIRE PROTECTION ASSOCIATION. Secretary of electrical committee, Ralph Sweetland, 141 Milk St., Boston, Mass.

NEBRASKA SECTION N. E. L. A. Secretary-treasurer, R. W. McGinnis, O'Neil Light & Creamery Co., O'Neil, Neb.

NEW ENGLAND ELECTRICAL CREDIT ASSO-

CIATION. Secretary, Alton F. Tupper, 15 State St., Boston, Mass.

NEW ENGLAND SECTION N. E. L. A. Secretary, Miss O. A. Bursiel, 149 Tremont St., Boston, Mass.

NEW MEXICO ELECTRICAL ASSOCIATION. Secretary-treasurer, E. A. Thiele, Roswell.

NEW YORK ELECTRICAL CREDIT ASSOCIATION. Secretary, Franz Neilson, 120 Broadway, New York. Annual meeting, June 1918.

NEW YORK ELECTRICAL SOCIETY. Secretary, George H. Guy, 29 West 39th St., New York.

NORTHWEST ELECTRIC LIGHT AND POWER ASSOCIATION. Affiliated with N. E. L. A. Secretary, George L. Myers, Pacific Power & Light Co., Portland, Ore. Annual meeting Sept. 11, 1918.

NORTHERN WHITE CEDAR ASSOCIATION. Secretary, N. E. Boucher, 743 Lumber Exchange, Minneapolis, Minn. Annual meeting, Minneapolis, Minn., Jan. 23 and 24, 1918.

OHIO ELECTRIC LIGHT ASSOCIATION. Secretary, D. L. Gaskill, Greenville, Ohio.

OHIO SOCIETY OF MECHANICAL, ELECTRICAL AND STEAM ENGINEERS. Secretary, Prof. F. E. Sanborn, Ohio State University, Columbus.

OREGON ASSOCIATION OF ELECTRICAL CONTRACTORS AND DEALERS. Secretary-treasurer, J. W. Oberender, 302 Dekum Building, Portland, Ore. Annual meeting, September, 1918.

PACIFIC COAST SECTION N. E. L. A. Secretary, A. H. Halloran, Crossley Building, San Francisco, Cal.

PENNSYLVANIA ELECTRIC ASSOCIATION. State Section N. E. L. A. Secretary, H. M. Stine, 211 Locust St., Harrisburg, Pa.

PENNSYLVANIA ELECTRICAL CONTRACTORS AND DEALERS' ASSOCIATION. Secretary, M. G. Sellers, 1518 Sansom St., Philadelphia.

PUBLIC SERVICE ASSOCIATION OF VIRGINIA. Secretary, W. J. Kehl, Virginia Railway & Power Co., Richmond, Va.

PUBLIC UTILITIES ASSOCIATION OF WEST VIRGINIA. Secretary, W. C. Davisson, West Virginia Water & Electric Co., Charleston.

RADIO CLUB OF AMERICA. Secretary, T. J. Styles, 152 Beech St., Yonkers, N. Y.

ROCKY MOUNTAIN ASSOCIATION OF MUNICIPAL ELECTRICIANS. President, Lawrence Stone, Denver, Col.

SOCIETY FOR ELECTRICAL DEVELOPMENT. Inc. General Manager, J. M. Wakeman, 29 West 39th St., New York.

SOCIETY FOR THE PROMOTION OF ENGINEERING EDUCATION. Secretary, Dean F. L. Bishop, University of Pittsburgh, Pittsburgh, Pa. Annual meeting, Evanston, Ill., June, 1918.

SOUTH DAKOTA ELECTRICAL POWER ASSOCIATION. Secretary-treasurer, Frederick D. Brown, Huron, S. D.

SOUTHEASTERN SECTION N. E. L. A. Secretary-treasurer, T. W. Peters, Columbus, Ga.

SOUTHERN CALIFORNIA ELECTRICAL CONTRACTORS AND DEALERS' ASSOCIATION. Secretary-treasurer, J. E. Wilson, 425 Consolidated Realty Building, Los Angeles, Cal.

SOUTHWESTERN ELECTRICAL AND GAS ASSOCIATION. Secretary, H. S. Cooper, 403-4 Slaughter Building, Dallas, Tex.

SOUTHWESTERN SOCIETY OF ENGINEERS. Secretary, C. E. Bargebaugh, 703 First National Bank Building, El Paso, Tex. Annual meeting, April, 1918.

TEXAS STATE ASSOCIATION OF ELECTRICAL CONTRACTORS. Secretary, H. S. Ashley, Fort Worth, Tex. Annual meeting, Galveston, Tex., June 15, 1918.

TORONTO ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, J. E. Myers, 3 Gould St., Toronto, Ont.

TRI-STATE WATER AND LIGHT ASSOCIATION. Secretary-treasurer, W. F. Steiglitz, Columbia, S. C. Annual meeting, Charlotte, N. C., April, 1918.

VERMONT ELECTRICAL ASSOCIATION. Secretary-treasurer, C. H. West, Rutland, Vt. Annual meeting, February, 1918.

VIRGINIA STATE ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, E. M. Andrews, Richmond.

WESTERN ASSOCIATION OF ELECTRICAL INSPECTORS. Secretary, W. S. Boyd, 175 W. Jackson Blvd., Chicago, Ill. Annual meeting, Jan. 29-31, 1918, Memphis, Tenn.

WESTERN SOCIETY OF ENGINEERS, ELECTRICAL SECTION. Secretary, E. S. Nethercut, 1735 Monadnock Block, Chicago.

WISCONSIN ELECTRICAL ASSOCIATION. Secretary, George Allison, 1410 First National Bank Building, Milwaukee, Wis. Annual meeting, March, 1918.

WISCONSIN ELECTRICAL CONTRACTORS AND DEALERS' ASSOCIATION. Secretary, J. C. Staff, 578 Jackson St., Milwaukee, Wis.

- 1,249,820. INSULATOR; Harry A. Pharo, Wilkesburg, Pa. App. filed Aug. 10, 1915. Means for supporting conductors securely without the use of the wires or other external fastening means.
- 1,249,821. PROCESS OF MAKING CYANOGEN COMPOUNDS; Herbert Philipp, Perth Amboy, N. J. App. filed June 2, 1910. Improvements.
- 1,249,854. FURNACE FOR TREATING ORES; Gottwerth L. Tanzer, Seattle, Wash. App. filed July 24, 1917. Improvements.
- 1,249,856. CURRENT TAP; George B. Thomas, Bridgeport, Conn. App. filed Jan. 15, 1916. Associated with an electric lamp socket.
- 1,249,857. ELECTRIC SWITCH; George B. Thomas, Bridgeport, Conn. App. filed Sept. 9, 1916. Toggle.
- 1,249,866. ELECTRIC LEAD-IN FIXTURE; Alois F. Walther, Detroit, Mich. App. filed Sept. 2, 1916. For use in connection with garages and buildings.
- 1,249,872. ELECTRICAL SWITCH LOCK; Paul W. Wiggert, Idar Grove, Iowa. App. filed July 10, 1916. Rotary members may be readily moved to inoperative position to prevent the switch from being closed except by a party familiar with the combination.
- 1,249,902. RAILWAY SIGNALING SYSTEM AND APPARATUS; Clyde J. Coleman, New York, N. Y. App. filed July 12, 1907. Improvements.
- 1,249,909. IGNITER FOR INTERNAL COMBUSTION ENGINES; James M. Dayton, Torrington, Conn. App. filed Sept. 26, 1914. Make-and-break type.
- 1,249,953. SPARK-PLUG TESTER; Claude E. Harlan, Watsonville, Cal. App. filed Feb. 19, 1916. Portable.
- 1,249,954. CONTROL SYSTEM; Rudolf E. Hellmun, Pittsburgh, Pa. App. filed Sept. 25, 1914. To prevent the occurrence of "flash-over" conditions in dynamo-electric machines, more particularly electric railway motors, under predetermined conditions.
- 1,249,962. TELEPHONE APPARATUS; Ludwig L. Lundgren, Youngstown, Ohio. App. filed May 3, 1915. Receivers.
- 1,249,965. FUSE AND CIRCUIT TESTER; Lynn D. Johnson, Portland, Ore. App. filed April 7, 1916. For electrician's kit.
- 1,249,978. INCANDESCENT LAMP; George M. J. MacKay, Schenectady, N. Y. App. filed Sept. 8, 1913. Tungsten.
- 1,249,982. MACHINE FOR SUBJECTING AIR TO CERTAIN LIGHT RAYS; Edwin M. Markel, Des Moines, Iowa. App. filed Jan. 23, 1917. For producing ozone by the passage through the air of a brush electrical discharge generated in the machine.
- 1,249,992. CIRCUIT CLOSER FOR COMBINATION LOCKS AND BURGLAR ALARMS; Melvin D. Morton, Gauley Mills, W. Va. App. filed June 6, 1916. Improvements.
- 1,250,010. ELECTRIC ICE CUTTER; Germain Pouchan, San Francisco, Cal. App. filed March 29, 1915. Reducing ice to the shape of small blocks ordinarily cubical, suitable for use in restaurants.
- 1,250,080. SEPARABLE ATTACHMENT PLUG; Reuben B. Benjamin, Chicago, Ill. App. filed Nov. 21, 1908. Improved means for relieving the binding terminals from strain due to a pull on the conductors.
- 1,250,093. STEREOSCOPIC X-RAY APPARATUS; William D. Collidge, Schenectady, N. Y. App. filed March 3, 1915. Improvements.
- 1,250,105. TIMER; Clifton R. Holmes, Montgomery, Mich. App. filed Nov. 6, 1916. Improvements.
- 1,250,116. TELEPHONE-EXCHANGE SYSTEM; Charles L. Goodrum, Brooklyn, N. Y. Application filed Oct. 11, 1916. Improvements.

(Issued Dec. 18, 1917.)

- 1,250,120. DECORATIVE ILLUMINATING MEANS; Alfred C. Abramson, Rockford, Ill. App. filed March 13, 1915. Portable lamps.
- 1,250,143. ELECTRIC SIGN; George S. Coleman, Newark, N. J. App. filed Oct. 21, 1916. Motion picture effect.
- 1,250,157. CONTROL DEVICE; Harry H. Fowler, Toledo, Ohio. App. filed May 20, 1915. Relates to interconnected elements of indication and operation.
- 1,250,183. ELECTROLYTIC CELL; Henry C. Jenkins, London, England. App. filed Nov. 22, 1916. An improved method of operating such cells.
- 1,250,209. INDICATING MECHANISM; Harry Y. Norwood, Rochester, N. Y. App. filed March 17, 1914. For indicating temperature.
- 1,250,385. ROTARY SPARK-GAP MACHINE; Clarence H. Teall, Detroit, Mich. App. filed Jan. 18, 1916. For use in connection with wireless apparatus.
- 1,250,402. ELECTRIC-HAMMER SWITCH; Alexander Wendelburg, New York, N. Y. App. filed July 28, 1914. Improved form of electric hammer.
- 1,250,451. CARBURATOR ATTACHMENT; Linn B. Harrod, Little Rock, Ark. App. filed March 28, 1917. Improvements.
- 1,250,460. BATTERY CELL; Walter E. Holland, Detroit, Mich. App. filed March 15, 1915. Edison or alkaline type.
- 1,250,545. FLASHLIGHT; Bernard Benedict, New York, N. Y. App. filed Sept. 8, 1914. Portable.
- 1,250,554. APPARATUS FOR SEPARATING AND RECOVERING DOMESTIC REFUSE. App. filed March 21, 1916. Improvements.
- 1,250,579. MACHINE-SWITCHING TELEPHONE SYSTEM; Charles L. Goodrum, Brooklyn, N. Y. App. filed Oct. 6, 1916. Improvements.

1,250,696—Storage Battery

- 1,250,581. ELECTRIC FIXTURE; Gustav A. Harter, Chicago, Ill. App. filed June 22, 1914. Fixture in which a socket, globe and shade are freely adjustable to facilitate the installation thereof and to accommodate lamps of different sizes.
- 1,250,583. SEMI-AUTOMATIC TELEPHONE SYSTEM; Henry J. Herink, London, England. App. filed March 8, 1917. In which there is a satellite exchange connected with a manual central exchange.
- 1,250,589. SIGNALING HORN; William Kaising, Chicago, Ill. App. filed June 12, 1914. Provision of a new diaphragm-actuating mechanism for devices of this kind.
- 1,250,641. AUTOMATIC CONTROLLER; Hermann Pauli, Peoria, Ill. App. filed Oct. 24, 1914. Improvements.
- 1,250,661. SIGNAL FOR VEHICLES; Edwin H. Roberts, Denver, Col. App. filed Nov. 11, 1915. Operable from the steering wheel.
- 1,250,674. SWITCHING APPARATUS; William M. Scott, Tredyffrin Township, Chester County, Pa. App. filed Nov. 4, 1914. Suitable for the control of various current paths or circuits for producing desired effects upon or by translating devices included in such paths or circuits, or for simply interrupting or closing such paths or circuits.
- 1,250,696. STORAGE BATTERY; Edward E. Stout, Indianapolis, Ind. App. filed March 10, 1917. Means to equalize the distribution of the lines of force of the current through the battery elements.

Electrical World

The consolidation of ELECTRICAL WORLD, ELECTRICAL ENGINEER and AMERICAN ELECTRICIAN

Volume 71

New York, Saturday, January 12, 1918

Number 2

Service Depends on Capital Supply

THE shares of public utility companies seem to be in little favor these days, as is evidenced from the quoted prices of various stocks. Some have reached very low levels, despite the fact that many of the properties have increased in value, in earning power and in efficiency. At the low price to-day the stock of some utilities offers a higher return to the investor, but this apparently is a time when investment yield receives scant consideration. And yet it is absolutely essential for the proper development of the industry that the utilities obtain money at reasonable rates, otherwise development will come to a standstill. The prosperity of the manufacturer, the jobber and the contractor depends in large measure on the increased activity of the central station. Moreover, without sufficient capital to meet the rapidly growing demand for electricity, service to the public is likewise curtailed.

Opportunity to Develop Foreign Water Powers

TWO of the allied powers, France and Italy, are very short of coal, and they look to the United States to help them in their distress. Neither country ever possessed much coal, but both have abundant water power, which they permit to run to waste. Being tarred with the same stick, the United States cannot with much grace remind them of this profligacy, and especially now since France has shown more enterprise than we in turning to her undeveloped water powers for relief. Italy, on the other hand, has done little toward utilizing the power of her mountain streams. This condition spells opportunity for American manufacturers of waterwheels and generators. An invaluable service can be rendered both nations by the rapid development of their water power, for not only will it help to solve the coal problem forever, but incidentally it will cut down the export of coal from this country and relieve precious ships for other work.

Changed Conditions in the Jobbing Trade

IN VIEW of competition arising from decrease in purchases and opportunities in other directions, electrical supply jobbers may profitably adjust themselves to changed conditions. Strict economy is essential. Stocks of miscellaneous supplies used in ordinary contracting and building trades will bear watching. To care for industries expanding to meet the war's needs,

larger sizes of conduit, fittings, cables and switches will be in demand. Since skilled mechanics in all lines of business will receive maximum wages and will on that account be in a position to buy, household appliances of a utilitarian nature will probably become attractive. Credits and collections need to be carefully scrutinized and enough cash should be kept on hand to meet emergencies. Diminished profits must also be reckoned with.

Opportunity Knocks at the Door

ELECTRIC utility companies are essential to the country in the conduct of war. There is no substitute for the service which they sell that will not, in comparison, be wasteful of men, money and materials. Realizing their importance, these companies have two courses open to them: either they may voluntarily place all of their facilities and resources at the disposal of the government or they may wait, possibly to be conscripted for service later, but in the meantime getting for their stockholders all that they can out of the situation.

The decision is clearly up to the directors and executives. Will they take the broad view that stockholders' ultimate interests will be best served by voluntarily considering such interests as secondary to those of the country? Failing to take this view, will they be courageous enough deliberately to sacrifice their stockholders' interests to those of the country? Will they have breadth of vision and enough courage to take one or the other of these views and "carry on" in line with such a policy, or will they take the attitude of the narrow-gage politician who considers it more important to secure a post-office building for his home town than to provide ammunition for our troops?

The decision in either case means more than the passage of resolutions to spread upon the records. It may mean a radical change in the point of view both of officials of companies and members of public service commissions. Demands from the public for extension of facilities or for lower rates, demands from employees for increased wages and demands from stockholders for increased earnings can, none of them, receive more than secondary consideration. Every question must be decided on the basis of the conservation of men, money and materials—conservation being understood to mean use in such manner as will aid to the greatest possible extent in winning the war.

Then it is necessary that there shall be developed a spirit of co-operation—not only co-operation between

companies and commissions, but co-operation between them and the Fuel Administration, War Industries Board and any and all other agencies having the same purpose in view of prosecuting the war with vigorous energy to a right conclusion. Old suspicions, prejudices and fears must be forgotten. Each party to such co-operation must assume that the other is at least trying to serve his country to the best of his ability. To place the interests of the country above any other consideration, to develop a spirit of co-operation and a willingness to sacrifice selfish personal desires for power, position, prominence or property, is as good and as practical a program for companies and commissions to adopt as it is for individuals. It is the least that many of us can do.

The Electric Light a Necessity

W E REGRET to note here and there in the public press statements intended to convey the impression that electric light is a non-essential which can be, and in the interest of fuel economy should be, reduced to the minimum possible use. Had that statement been made thirty years ago it might have been backed up by reasonable arguments. To-day it comes pretty near to being a malicious fabrication. So many communities at the present time depend also wholly on electricity for artificial lighting and are using energy so economically generated that any considerable reduction in usage would simply be a public hardship. We believe heartily, as every good American should, that in these times there should be careful economy in all things, but to a public dependent so largely as it is upon electric light for its after-dark activities of every kind the singling out of this particular thing for attack seems to show a singular lack of perspective. A first-class central station turns out the kilowatt-hour on two to three pounds of coal, as every well-informed engineer knows, and this amount of energy will supply a dozen 20-cp. incandescent lamps for considerably more than the average evening's use.

It would be hard to point out a place where a small amount of fuel can produce so great a result in usefulness and convenience. Enough coal is wasted daily in the average kitchen range to supply adequate light for the house it serves. If electric light were replaced by gas or oil, the situation would not be bettered in the least, for both require the use of amounts of fuel not to be neglected and more important than the fuel used in the electric light station. If we really want to save fuel—and such saving is unquestionably necessary—the place to begin is not at the point of highly efficient use, but in those things where waste is notorious, like the range, the furnace and the open grate, the last named being the most absurdly inefficient of all heating devices. There is a remarkable lack of breadth of view in the public perception of war-time economies, a frequent and silly endeavor to single out the sensational instead of getting down to bed rock and devoting attention to the important. This straining at gnats and swallowing of camels is surely not what is most needed in the present crisis.

That the strictest economy all along the lines is desirable goes without saying. It is bad judgment to use light or fuel carelessly and lavishly, and economy should be practiced as a personal virtue when the times are such as to demand the full resources of all. We are not in the least worrying about the business of the electric companies. The needs of the war will keep up their output and increase it, but we do lament the foolishness that in its anxiety to save at the tap condones illimitable spilling at the bung hole.

Motor-Driven Planers

T HE latest of Professor Clewell's interesting discussions of electric drive deals with the special requirements of planer operations. The planer is one of the most important of machine tools and in some respects the least efficient from the standpoint of output, since at best only half of its motion is taken up in cutting, as opposed to the works of lathes and milling machines. The first requirement, therefore, of a scientific drive is that it should operate on the cutting stroke at the speed of maximum efficiency for the particular metal and the cut in hand, and that it should get back for another stroke in the minimum possible time with as little fuss and strain on the equipment as is practicable.

The actual work required in making the cut is a comparatively small part of the cost of the whole planing operation, so that power economy itself is a less important item here than in many other machines. To meet the requirements of the particular cycle of operation necessary two general schemes are in use. The first of these provides an independent motor drive of the planer, using the ordinary belt equipment and eliminating the line shafting. In this case the motor runs at constant speed and the ordinary belt-shifting device takes care of the varying speed required in the cutting stroke and of the swift return necessary. It is not unusual to accelerate the return by automatic change in the field resistance. The obvious difficulty with the arrangement is the heavy demand for power and the severe strains imposed during the mechanical reversal.

Of late planer manufacturers have been looking with more and more favor on the purely electric drive with reversing motor, using dynamic braking to take up the shock of the necessary reversals. A complete electric drive, of course, gives all manner of opportunity for proper speed variation, at the cost of somewhat more complicated and costly motor equipment. The chief advantage gained is a greater degree of flexibility and the practical abolition of the very severe strains arising from inertia of rotating parts. The inertia of the moving platen is small and that of the rotating parts is relatively very high, causing a corresponding violent effort in reversal. With the dynamic braking possible in the directly driven equipment this difficulty is greatly reduced, and when properly adjusted the direct-driven planer ought to be able to do the work with less wear and tear than if belting were employed with a continuously running motor. The balance of cost in the two cases is not altogether easy to figure out, but experience with other electrical drives would indicate that the increased smoothness and flexibility of control with the reversing-motor equipment is well worth the while

in standardized operations where workmen can be taught to use habitually the most efficient speeds. And in this, as in many other similar cases, it is output which counts as the largest item in successful manufacturing, especially when costs of material and labor are running to exaggerated figures.

Lighting Ships Under Construction

MANY shipyards are now working day and night in the effort to supply the enormous demand for new vessels. This task requires constant and efficient illumination of the construction work by night, illumination not only good enough for ordinary night work but sufficient to insure the effectiveness of the workmen, bringing it up as nearly as may be to a daylight standard. A brief article by William G. Hexamer in the current issue gives some extremely useful hints as to the provisions that must be made for this difficult work.

The objectives to be accomplished may be divided into three separate parts or stages of development—first, provisions for lighting along the permanent ways of a character to meet any reasonable demand for this generalized illumination; second, the lighting of skeleton vessels under construction but not yet ready for anything like a standard temporary system, to meet the requirements of local lighting, and, finally, at a certain stage in the operations a systematic wiring plan must be introduced of so general a character that it can be shifted from ship to ship as one after another leaves the ways and is replaced.

In the example discussed the first requirement is met by regular mains on an ordinary 110-220-volt three-wire system reaching as nearly as may be the full length of the ways, at least down to the water line. This simple installation, with outlets every 20 feet (6 m.) for branches and for reaching a parallel two-wire system on each side of the mains, completes provision for general lighting. There is added, however, a junction box conveniently placed for installing the temporary wiring within the ship. Later as the hull progresses a point is reached where double bottoms and other compartments must receive light to meet the local requirements. For this a ten-outlet plug board is placed at the point of greatest demand, to which portable lamps are attached by 50-foot (15.2-m.) lengths of cable. Finally, when the frame is closed in and the decking in place, mains are stretched on porcelain knobs clamped along the edge of the deck on each side of the vessel. These are fed from the permanent outlet provided and each circuit is subdivided into four by knife switches. Taps are taken from these mains to accommodate plug boards,

to which standardized temporary fixtures equipped with 200-watt nitrogen lamps are attached. These furnish a general illumination in the interior of the vessel, while for detail work the portables are retained, the necessary plug boards being installed as the work requires. The mains provided for the permanent ways are utilized for electrical drills and reamers at this stage of construction. It will be seen that this layout is one which fits itself very readily to utilization in ships of various kinds and sizes and gives very flexible provision for the complete lighting of the construction with a minimum of labor as each new keel is laid and the work progresses. It furnishes a capital example of the advantage of systematic methods in accelerating construction.

Intensive Use of Fuel

IN the interest of fuel conservation, attention should again be directed to possibilities of saving through co-operative working between gas and electric companies. This matter has recently been the subject of investigation by the British National Gas Council, with the co-operation of electrical engineers, and some interesting results have been reached. A report is to be laid before the government suggesting, first, that all bituminous coal should be treated for the extraction of its by-products and that gas and electric companies conveniently situated should co-operate through the use of coke as fuel. This is in line with previous studies made in England which have been reported in our columns. The fact is that bituminous coal has constituents which are more valuable from a practical standpoint as gaseous or liquid by-products than they are as mere fuel; and some systematic effort ought to be made to save these incidental values before the coal is thrust into the furnace.

Just at present the fuel supply is so terribly disorganized that the question is not of the orderly utilization of coal but of ability to obtain almost anything that will burn. We recently described the successful use of various low-grade fuels, including even coke breeze, through automatic stokers for raising steam, and boilers gas-fired from coke ovens are already in use. As soon as the situation is cleared up enough to permit an orderly view to be taken, it would be well for the gas and electric companies here to put their heads together with the intention of seeing whether some mutual plan for the better utilization of coal cannot be worked out. Gas and electric companies are no longer, as they used to be, at swords' points, and any vague inherited feeling of distrust ought to be dissipated in view of a common interest in the saving of our fuel supply.

NEXT week's issue will contain an article treating of coal conditions as they affect steam electric central stations throughout the country. There will also be published an illustrated article showing how the United States can effectively aid France and thereby conserve our coal and ships by rapidly developing her water powers in true American fashion. Commencing with this issue, we will devote additional space to technical subjects falling in

The Coming Issues the gap between pure science and applied engineering. These will include investigations of the suitability of different apparatus to operate under different conditions, results of studies which may lead to developments in apparatus or equipment, studies of purely engineering problems with a view to their solution, the evolution of principles which may change present operating methods, etc. Reading pages will be added to care for this extra material.

New England Coal Situation Very Serious

Economy in the Use of Fuel and Increased Efforts to Obtain a Supply Now Matters of Government Concern—Widespread Publicity by Fuel Administrator's Office in the Interest of Coal Conservation

BY JAMES J. STORROW

New England Fuel Administrator

WITH a shortage of 7,801,570 tons of bituminous coal on Jan. 1, 1918, New England faced one of the most critical situations industrially that have arisen anywhere on this continent since the outbreak of the world war.

The railroad congestion now has reduced the car supply for commercial coal at the Pennsylvania mines, bringing New England less than 20 per cent of its contract requirements, with no coal whatever for hundreds of New England plants which depend upon buying spot coal in the market. The taking of tugs and ships for governmental purposes has also greatly reduced the supply of coal moving by water from the West Virginia mines to Boston, Providence, Portland and other New England coal-distributing ports. Unless immediate and effective action is taken by the government within a few days to increase the movement of coal to New England, many hundreds of millions of war equipment which the government is expecting New England to produce will not be produced. Many people do not realize that, even though we are at war, many million tons of coal must be burned for purposes which come ahead even of rifles, cartridges and poison gas.

ENORMOUS COAL CONSUMPTION OF NEW ENGLAND

In the first place, it takes over 13,000,000 tons of coal a year to keep the houses of New England warm and cook the daily food of the inmates. It takes over 6,000,000 tons to keep the New England railroads running. It requires many millions of tons for the trolley lines, without the operation of which employees cannot get to the great Fore River shipbuilding plant and the rest of New England's industrial establishments. Moreover, the gas and electric light plants, which burn millions of tons, must be kept going. It was 30 deg. below zero in northern New England on the morning of Dec. 29.

There is one New England company alone which has undertaken to turn out 3,500,000 yd. (3,200,000 m.) of shirting for our soldiers, 3,500,000 yd. (3,200,000 m.) of khaki, 4,000,000 yd. (3,650,000 m.) of cloth to make overcoats, and 3,500,000 yd. (3,200,000 m.) of blankets. This is merely one illustration.

The New England Fuel Administrator visited Washington on Dec. 29 and conferred with Dr. Garfield, Chairman Hurley of the Shipping Board and Secretary of War Baker. The New England crisis will receive very careful consideration from these officials, with a view to finding a prompt and effective remedy. It is expected that the situation will also be taken up with Secretary McAdoo and his advice and assistance sought, but at this writing it is impossible to state the exact steps which the government will take.

The total consumption of bituminous coal in New England in 1916 was 27,145,752 tons. An estimated

increase of 20 per cent in 1917 is probably low for soft coal, as the New England industries are working under the most intensive pressure ever known and probably to a greater extent than any other section of the country, except perhaps the steel-making districts. Normally New England carries two-thirds of its soft coal by water and one-third by rail. Owing to war conditions, many of the New England coal-carrying bottoms have gone off the coast and cannot be replaced. The already overloaded New England railroads can assume few if any additional burdens. Winter storms and cold weather easily cut down the capacity of these railroads by at least 25 per cent, and the same cut applies to the coal-carrying fleet in winter weather. New England's problem is quite as much one of transportation as of securing coal. It is likely that the shortage will grow worse owing to lack of transportation facilities, and the importance of every possible economy in the use of fuel cannot be exaggerated.

By long custom of the trade, New England has been pre-eminently a spot coal market. The mines have been glad to sell their coal for cash to New England consumers during the summer months while other localities were less ready to buy coal. New England consumers have learned the necessity of accumulating a supply of coal during the summer, owing to the inability of rail and water transportation facilities to carry coal as fast as it must be burned during the winter. Owing to its greater distance from the mines, New England is considered a less desirable market, and at times consumers have been obliged to bid higher prices than other localities in order to divert coal in their direction.

ACUTE SITUATION IN SPOT COAL

The situation in New England in regard to spot coal became acute as soon as the tentative maximum price of \$3 was put into effect by the coal production committee, because New England consumers were prevented from bidding higher than other localities for the coal they needed and the mines and originating railroads at the same price preferred to improve their inadequate car supply by selling coal nearer the mines and so getting their cars back sooner. Now that the two-dollar price is in effect, the situation has grown no better, to say the least. A very large number of New England manufacturers who are dependent upon buying spot coal for their own use have been completely shut off. Most of the coal is going to fill contracts at higher prices, and if there is any surplus of free coal it is being sold nearer the mines. New England today cannot buy a carload of spot coal.

A general response has been received to the requests of the Fuel Administrator's office on behalf of coal conservation, as well as to the orders of the federal

administration. A large amount of publicity material has been prepared and spread broadcast in New England, ranging from suggestions toward the reduction of fuel waste in the home to the publishing of instructions bearing upon improved firing in the industrial and public utility boiler room. The war aspect

THIS REPORT SHOULD BE MADE IN DUPLICATE AND BOTH COPIES RETURNED WITHIN 5 DAYS TO

U. S. FUEL ADMINISTRATOR FOR NEW ENGLAND
STATE HOUSE, BOSTON, MASS.

STEAM PLANT DATA

Name of company _____ Address _____
 Name of plant _____ Location _____
(Make out a report for each plant. Extra blanks will be supplied on request.)
 Average hours per day plant is operated _____
 Kind of coal used _____ Average daily consumption of coal _____ (In pounds)
 1. Number of boilers and horse power of each _____
(State whether water or fire tube)
 a. Natural or forced draft _____
 b. Normal steam pressure carried _____ Maximum variation _____
 c. Are boilers equipped with automatic damper regulator? _____
 d. Are all blow-off connections tight and free from leaks? _____
 2. State average temperature of feed water entering boilers { Observed _____
 { Estimated _____
 a. Are pumps or injectors used to put water in boilers? _____
 b. Do you use an open or closed feed water heater? _____
 3. Number of engines and horse power of each _____
(State whether simple or compound, condensing or non-condensing)
 a. What method of transmission? _____
(State whether mechanical or electrical)
 4. State other purposes and pressures for which steam is used _____
(Such as heating buildings or water, cooking, pumps and process uses)
 5. Is exhaust steam from engines used in whole or in part? _____
 a. State service _____
 b. Do you have a surplus? _____
 6. Is all steam used under questions 4 and 5 supplied with a suitable steam trap? _____
 a. Are steam traps known to be in good working order? _____
 b. How many steam traps return the condensation directly or indirectly to the boilers? _____
 c. How many steam traps discharge the condensation to waste? _____
(Give size and service connected.)
 d. Are any return pipes connected to waste manually controlled? _____
 7. Is steam used from open end pipes? _____
(State purpose, and whether or not a trap could be used)
 8. Are all steam pipes properly insulated? _____
 9. What changes have you in progress which are expected to reduce your fuel consumption? _____
(Give expected date of completion and estimated saving.)

QUESTIONNAIRE OF NEW ENGLAND FUEL ADMINISTRATION

of fuel saving has been constantly emphasized, and the part each individual can play has been set forth clearly. The public in general is certainly beginning to realize the value of economies on a small scale no less than on a large one.

Central stations have displayed a keen appreciation

of the situation and have refrained from taking on a large amount of "non-essential" power business which in normal times would be welcomed with open arms. Realizing the economy in fuel to be derived from the installation of central-station service in a great number of cases, owners of private power plants throughout Massachusetts have been asked by the New England Fuel Administrator to consider the economic possibilities of buying power under favorable conditions, and within a few days a report form has been sent to steam plants, to be returned to the Fuel Administrator's office at the State House, Boston, covering the essential data from which the possibility of more economical use of fuel may be determined.*

This form includes such points as the daily hours of plant service, kind of coal, amount of fuel used, description of boilers, data bearing upon steam pressure, feed-water supply, conditions of piping, blow-off connections, leaks existing, uses of output, type and number of engines, size of generating units, use of exhaust steam, condition of traps, and surplus power available.

The office of the Fuel Administrator is co-operating with fuel users in every feasible way to help them obtain service at greater efficiency and reduced coal consumption, and has offered to assist in engineering analyses of plant conditions with respect in particular to determining the desirability of installing central-station service or effecting other improvements in the coal consumption of steam plants. The so-called "lightless nights" ordered by the federal government are being observed with more and more care, and it is not too much to say that New England is making the most vigorous effort to help herself while seeking the aid of the federal government in order that her industrial life may continue to render the utmost patriotic service in this time of the nation's necessity.

Maximum Load of Commonwealth Edison

The maximum load of this winter, and also in its whole history, for the Commonwealth Edison Company of Chicago occurred at 5 p. m. on Dec. 28, when a total of 410,910 kw. was observed on station meters. Integrated over the half-hour period between 5 p. m. and 5.30 p. m., this amounted to 397,144 kw. Of this, 4814 kw. was used by generating stations for their own power requirements. This amount, together with that consumed in about fifty substations, places the Edison company in the ranks of the largest consumers of its power. The kilowatt-hour output on this day was 5,428,634 kw.-hr., slightly lower than a previous high output, which occurred on Dec. 13 and up to the present constitutes the largest output in the history of the company—5,456,758 kw.-hr. The railway load, as usual, is the predominating factor, amounting to 218,320 kw., while the total Edison load amounted to 176,794 kw. Of the Edison load, on an integrated basis, about 110,000 kw. was 60-cycle, while the direct-current light and power amounted to about 62,000 kw. At the time this maximum occurred the company had a total rated reserve generating capacity of 61,000 kw. in batteries and in reserve steam plants.

*In some quarters the purpose of asking isolated plants to consider the economy of buying power was misunderstood and the Fuel Administrator was charged with issuing central-station propaganda. Absolutely no such intention existed, the sole object being to encourage every possible fuel saving.—Editor.

Long Spans Permitted by Steel Wires a Saving

Practice Followed by Some Pacific Coast Companies in the Substitution of Steel for Copper Has Been Found of Material Advantage—Summary of San Diego Companies' Specifications

BY L. M. KLAUBER

San Diego Consolidated Gas & Electric Company

THE savings which may be effected by the use of steel in the place of copper in lines of moderate length and load warrant careful consideration of the cheaper metal. Steel conductors not only effect a saving due to reduced cost per unit of length, but also, owing to greater tensile strength and reliability, per-

absolute safety. After several branches were put in by the San Diego Consolidated Gas & Electric Company, using $\frac{1}{4}$ -in. (6.3-mm.) standard steel and 550-ft. (167.6-m.) spans, 700 ft. (213.4 m.) was selected as a standard, and many miles of line have been built with spans of this length. Naturally, large sags were necessary with these spans. Although flat construction had always been used in distribution circuits employing copper conductors, the old-style triangular construction, with a pole-top pin, was adopted, with steel to give greater clearances between conductors.

The use of steel conductors and long spans introduces no difficulties. With the greater strains experienced, guying at corners must receive careful consideration. As a rule stubs must be specially heavy and anchored. Anchor guys must be used in quantity; at sharp corners four and six anchors to the pole are occasionally required.

The San Diego Consolidated Gas & Electric Company has now installed in main or branch lines exceeding a mile in length 68.6 circuit miles (201.3 wire miles) of steel conductors of $\frac{1}{4}$ -in., $\frac{5}{16}$ -in. or $\frac{3}{8}$ -in. standard steel. In addition there are 25 miles (75 wire miles) under construction. Also there are 52.5 wire miles of $\frac{1}{4}$ -in. steel in constant-current series circuits. Most of the constant-potential circuits are 11 kv., although a few are 2300 volts.

A brief summary of the specifications used in a recent 11-mile (17.7-km.) extension of an 11-kv. line follows:

Conductor.— $\frac{3}{8}$ -in. extra-galvanized, standard steel, seven-strand.

Spans.—700 ft. Vary as dictated by topography of country, taking advantage of knolls and hill tops. Spans not to be shortened at corners. Maximum single-pole spans to be 1000 ft.; terminate spans exceeding 1000 ft. on double pole structures. In spans exceeding 1500 ft. use high-

FIG. 1—CONSTRUCTION EMPLOYED FOR 70-DEG. TO 110-DEG. ANGLES AND FOR 0 TO 70-DEG. OR 110 TO 160-DEG. ANGLES

mit wider spacings in supports. Poles, cross-arms, insulators and line hardware have all advanced greatly in price and are often difficult to obtain at any price, and the reduction in the cost of supporting structures by the use of steel is as important as the saving in the conductor itself.

The Pacific Coast companies have for some time past used comparatively long pole spacings with copper conductors and wood-pole lines. Standard spans of 350 ft. (106.7 m.) with No. 6 or No. 4 solid, or 450 ft.

FIG. 2—CONSTRUCTION EMPLOYED IN SPANS NOT EXCEEDING 1000 FT., OR 175-DEG. TO 180-DEG. ANGLES (USE DOUBLE ARMS AT ALL ANGLES, CROSSINGS, AND FOR SPANS 500 FT. OR LONGER) AND FOR DEAD-END POINTS, OR 160-DEG. TO 175-DEG. ANGLES (IN TANGENTS OVER ONE MILE IN LENGTH USE ONE PER MILE)

(137.2 m.) with No. 2 or No. 1 stranded medium hard-drawn bare-copper conductors, have been used extensively without the slightest difficulty.

With the advent of steel conductors it was seen at once that these spans could be greatly exceeded with

strength steel. Shorten spans to 200 ft. where possible in crossing railroads, main highways and telephone toll leads.

Clearances.—Minimum clearances over railroads, 28 ft.; over traveled highways, 24 ft.; over other supply lines or communication lines, 6 ft.

Poles.—Class A Western red cedar with open-tank

treated butts. Standard pole on tangents, 40 ft.; at corners, 45 ft. Other lengths as required by topography. Set at N. E. L. A. standard depths. All poles to be shaved and gained at pole yard.

Wire Arrangement.—Triangular with vertical corners.

Transpositions.—Six-mile barrels unless by special agreement with communication companies.

Cross-Arms.—3½-in. by 4½-in. by 8-ft. Douglass fir, painted with two coats of yellow cement paint.

Braces.—28-in. galvanized N. E. L. A. standard.

Pins.—St. Louis Malleable Casting Company No. 435 R galvanized with felt insertion.

Pole-Top Pins.—Hubbard No. 3020.

Insulators.—Ohio Brass No. 12546 or Locke No. 5155 (27,000 volts).

Strain Insulators.—Locke No. 3039 in pairs. A complete dead-end consists of one spring clevis, two No. 3039 strain insulators, ¾-in. galvanized thimble and two three-bolt guy clamps.

Tie Wire.—Galvanized steel. Use one strand of the ¾-in. conductor 48 in. long. Use a double back tie.

Splices.—Splice with five three-bolt guy clamps and two ¾-in. thimbles. No solder.

Guy.—¾-in. extra-galvanized standard steel, same as conductor. Use double sets of three-bolt guy clamps.

Guy Insulators.—White's No. 506. Use one strain insulator in each guy, 4 ft. to 8 ft. from the pole. Also in the lower ends of guys attached to stubs not anchored.

Anchor.—Use pyramidal concrete anchors except in marshy ground, where treated wood slugs must be used. Where spans adjacent to corners exceed 500 ft. use pairs of anchors. Anchor stub guys in soft ground or where stub holds a corner adjacent to a span exceeding 500 ft. Anchor rods to be standard ¾-in. galvanized, 8 ft. long. Use anchor boxes where required for the protection of persons.

Stubs.—Stubs to be Western red cedar poles 16 ft. 9 in. to 19 ft. 6 in. in length. Minimum top, 28 in.; minimum circumference 6 ft. from butt, 34 in.

Switches.—Line switches, Pacific Electric No. 1420; transformer switches, Pacific Electric No. 422-F.

Hardware.—All bolts, clamps, lag screws and miscellaneous hardware to be galvanized in accordance with N. E. L. A. specifications.

Special Foundations.—Set poles in concrete at heavy marshes. Use trussed pole set in concrete or push brace where anchors cannot be placed.

Operating Characteristics of Motor-Driven Planers

Relative Merits of Non-Reversing and Reversing Motor Equipment for Planers— Emphasis Is Placed on the Method of Control Required Because of the Peculiar Character of the Duty Cycle

BY C. E. CLEWELL

Assistant Professor of Electrical Engineering, University of Pennsylvania

SYNOPSIS.—This article contains an analysis of the duty cycle of the planer and a discussion of the requirements of the driving equipment. The non-reversing motor is described and compared with the reversing equipment. Special emphasis is placed upon the method of control which is required. Incidental items, like the reduced flywheel effect due to the absence of pulleys with the reversing motor, the advantages of dynamic braking, remote control and the automatic action of the master switch in connection with the controller are also treated at some length. Economic advantages are set forth which may result directly from a careful study of cutting speeds and the speeds of the return strokes, increasing the ratio of the latter to the former, eliminating the time losses from belt slip at the points of reversal and the like.

THE duty cycle of the planer possesses peculiar characteristics which must be taken into consideration when selecting a driving motor and the control apparatus. Obviously, the speed of the platen on its return stroke when no cut is being made can be greater than its speed during the cutting stroke when the metal is being removed by the stationary cutting tool. In fact, the speed during the cutting stroke should be adapted to the most economical cutting speed from the standpoint of the cutting tool, the strength of the machine itself and similar items of the same general nature which govern the most economical speeds for lathes and other metal-working machinery. Hence, to increase as much as possible the amount of metal which may be removed during a day it is important to reduce the time of the reverse or return stroke by increasing the speed of the platen for this part of the cycle to as high a value as the machine tool will economically stand. This results in two different driving speeds for each cycle.

Moreover, it is essential for the economical operation of the planer that the time consumed in making the

reversal at the end of each stroke be as small as possible. Hence the motion of the planer must be stopped as quickly as possible at the end of each stroke and accelerated promptly in the reverse direction.

From these elements of the duty cycle it follows that the motor is required to pass through two starting periods for each cycle and that it should be capable of operating at two different speeds for the two strokes. The points at which economy may be effected are in maintaining the most economical cutting speed for each class of material worked upon and for each depth of cut and feed, to brake the equipment quickly at the end of

FIG. 1—A METHOD OF CONTROLLING NON-REVERSING PLANER WHICH APPLIES FOR REVERSING EQUIPMENT IF A REVERSING SWITCH IS ADDED AND PROVISION MADE FOR DYNAMIC BRAKING

each stroke, to accelerate it promptly and quickly in the reverse direction, and to maintain throughout the return stroke as high a speed as is consistent with the operation of the planer.

BELT DRIVE CONVENIENT IN ELECTRIFYING LINE-SHAFT EQUIPMENT

Belted motor drive, sometimes termed the "non-reversing" motor equipment, for planers possesses a number of interesting features which will be made the basis for comparison later with the "reversing" motor

equipment. In an arrangement of this kind (Fig. 4A) the chief advantage of the motor drive is that the speed of the motor may be adjusted independently for the forward or cutting stroke as well as for that of the reverse stroke, thus placing the most economical operating speeds at the convenient disposal of the operator.

FIG. 2—A 48-IN. BY 48-IN. PLANER DRIVEN BY A 20-HP., FOUR-TO-ONE ADJUSTABLE SPEED-REVERSING MOTOR (CONTROLLER ON PLANER FRAME)

Incidentally, this type of equipment can readily be applied to planers already in operation at relatively small expense and with little or no change in the arrangements in the shop. Moreover, the use of belts and pulleys makes it possible to use a higher speed motor and one with a lower speed range than in those cases where a reversing motor is directly coupled to the machine.

The usual procedure with this equipment is to start the motor either by a hand-operated starting rheostat or by an automatic magnetic starter controlled by a pendant switch in the hand of the operator. The motor then runs continuously in one given direction, whereas the platen is reversed at the end of each stroke by the usual tight and loose pulleys and belts (Fig. 4A). To obtain the two distinct speeds for the cutting and return strokes two field rheostats are used in the controller, connected in parallel with the field, but so connected to the master switch that only one is in the field circuit at a time.

A master switch (Fig. 4D) is usually attached to the side of the planer to insure that only one field rheostat will be in the field circuit during the cutting stroke. At the end of the cutting stroke a trip on the side of the moving platen operates the switch, thus connecting the other rheostat in the field circuit automatically.

A simplified diagram of connections for such an arrangement is indicated in Fig. 1. While this diagram

relates primarily to the non-reversing equipment, it applies equally well with slight modifications to the reversing equipment, which is also described here.

The foregoing notes indicate that the non-reversing equipment is merely one step from the straight line-shaft drive toward the ideal individual motor application. The non-reversing motor affords the distinct advantage of independent control of speed for the two strokes, but the reversal itself as well as bringing the platen to rest are functions of the belts and pulleys. In bringing the platen to rest by change of belts not only must the inertia of the platen itself be overcome but also the flywheel effect of the pulleys. Moreover, to reverse the motion by a belt introduces slippage, which obviously causes a time loss in the interval of reversing, sometimes as much as 10 per cent of the duty cycle.

ADVANTAGES AND DISADVANTAGES OF NON-REVERSING MOTORS

The reversing motor equipment, as its name implies, provides in the motor equipment the function of reversal plus all of the elements of the non-reversing equipment and the facilities of dynamic braking, thus meeting practically all of the requirements of an ideal individual motor drive. Being directly connected to the planer, the speed range of a reversing motor is necessarily greater than in the non-reversing type, being four to one ordinarily in the former and two to one in standard types of the latter.

The controller equipment, which is similar in form to that used with the non-reversing motor (Fig. 1), must have in addition a switch for reversing the direction of rotation and also the connections and equipment required for dynamic braking. The wider speed range

FIG. 3—A 14-FT. BY 30-FT. PLANER EQUIPPED WITH A 75-HP., FOUR-TO-ONE ADJUSTABLE-SPEED REVERSING MOTOR (CONTROLLER ON NEARBY COLUMN)

of the reversing motor, the lower value of the maximum speed and the additional elements in the control all tend to increase the first cost of this type in comparison with the non-reversing type.

From the standpoint of economy, the reversing motor eliminates the belts and pulleys, thus avoiding belt

slip, and the dynamic brake makes it possible to stop the planer before reversal in a more satisfactory manner than by some of the other methods. In one test a planer which was stopped in twenty-four seconds by friction alone was brought to standstill in two and one-half seconds by dynamic braking.

It is perhaps not usually recognized that the advantages of the dynamic brake rest not solely on quickness of stopping, but also on the elimination of brake-shoe wear and on the ability to begin the braking period with less braking action than is effective later on. In other words, this scheme makes it possible to graduate

a planer. A. G. Popcke has shown, for example, that the inertia of a 15,000-lb. (6803.8-kg.) planer platen when moving at a speed of 100 ft. (30.5 m.) per minute has about one-twenty-fifth of the inertia of a 35-hp. motor running at 1000 r.p.m. This gives an excellent idea of the enormous flywheel effects which may be introduced into the mechanical system of a planer by motor drive and why the absence of pulleys resulting from the use of reversing motors may reduce the inertia of the moving system as a whole, and particularly so if the motor has a relatively small diameter rotor. In this connection Popeke shows that a reduction of

FIG. 4—APPLICATIONS OF MOTORS TO PLANERS AND TWO TYPES OF CONTROL APPARATUS

A—Motor-driven planer with belted connection. B—One type of controller employed for reversing motor. C—Method of connect-

ing motor to planer. D—Master switch for use with non-reversing motors

the mechanical braking forces and to avoid the shock to the system which may result from braking in one step from high speed.

FLYWHEEL EFFECT VS. PLATEN INERTIA

Interesting figures are available to show the flywheel effect of pulleys and of the revolving armatures of motors in comparison with the inertia of the platen of

5 in. (12.7 cm.) in a motor-armature diameter of 19 in. (48.3 cm.) may reduce the inertia or flywheel effect nearly 100 per cent.

Push-button or pendent switches, from which the motors may be started or stopped, are especially desirable if placed in convenient locations, as they save time and relieve the motor and driven mechanism of the strains that might be caused by manual starting, etc.

In one of the ordinary types of planer motor control, for instance, a relay short-circuits the field rheostat and thus permits full field current as long as the armature current is above some given value. As soon as the current drops below the given value the relay again

the labor charge but also the overhead expense which must be assigned to the given operation.

The power for driving such a machine tool per hour may be seen to be a very small relative item even for the larger planers. Any saving in power per hour of operation has, however, an appreciable although small effect on the aggregate hourly cost and should hence be duly considered. Tests on belt-driven planers and reversing motor-driven planers, conducted over a considerable time interval so as to give average values, indicate that the energy consumption per hour may be as much as 25 per cent greater for the former than the latter. One reason for this is that the reversing motor is shut down between operations and at the times of making necessary adjustments in the work, and hence the power consumed will naturally be less than in those cases where belt and shafting losses continue during these intervals. The elimination of line shafting and belting removes the necessity of belt maintenance, repairs and belt renewals and also saves the time required for this upkeep work. Cases have been reported where such upkeep work has amounted to as much as from \$100 to \$500 per annum per planer.

Added to these items there are the economies which result from increasing the cutting speed. Where the belted planer does not possess the required speed changes for giving this most economical speed for given operations, the increased flexibility of the motor control can be made to yield much improved results. Similarly, the ratio of the return stroke speed to the cutting speed may have a considerable bearing on the output. Thus if the most economical cutting speed is obtainable and is used, quite a change may be made in the amount of time available per day for the cutting strokes by increasing the ratio of the return speed to the cutting speed as shown in Fig. 6.

Other advantages of direct-connected motors are the elimination of belt slippage and quick braking made possible by reducing the flywheel effect of the rotating elements. Time may also be saved by the facility with which adjustments may be made in setting up the work by the accurate and convenient control which is afforded in the motor equipment.

When it is not clear that the added investment for a reversing motor or even a non-reversing motor equip-

FIG. 5—INCREASED TIME AVAILABLE FOR CUTTING WHEN RATIO OF RETURN SPEED TO CUTTING SPEED IS INCREASED

inserts the field rheostat corresponding to normal speed for the given stroke.

POINTS OF ECONOMY IN METHODS OF DRIVE

While the advantages of the two principal methods of motor drive for the planer, just outlined, are fairly obvious, the substitution of either type for the line-shaft drive must necessarily rest on cost factors or on the points of economy in favor of the motor in contrast to the shaft-driven tool. The items which constitute the operating expense for the average planer are given* in the table.

In this the item "miscellaneous expense" includes general repairs, storage, haulage, tool-room charges and interest and depreciation on the cost of buildings and auxiliary apparatus, such as cranes, lights and the like, which are chargeable in part to each machine tool. A study of this table shows that the machine-hour cost rating will not vary to any considerable extent with the output, and hence it takes the form of a more or less fixed charge, which goes on whether the output is large or small.

Hence, if the motor drive is capable of increasing the output from a given planer per unit of available time per day for productive work, in comparison with the line-shaft-driven planer with the same labor expense, this then constitutes a fundamental and most important economic advantage for the motor-driven tool. This is apparent when it is considered that a larger output for each possible machine hour per day not only reduces

ITEMIZED LIST OF OPERATING EXPENSES FOR TYPICAL PLANERS

Size of Planer	Interest and Depreciation on the Cost of the Planer	Cost of Power (Cents per Kw.-Hr.)	Miscellaneous Expense	Supervision and Clerical Work	Total Machine Hour Rate
36 in.	\$0.04	2	\$0.49	\$0.25	\$0.80
48 in.	0.12	2	0.59	0.30	1.03
56 in.	0.09	4	0.69	0.35	1.17
60 in.	0.18	4	0.70	0.35	1.27
130 in.	0.22	6	2.68	1.35	4.29
7 ft.	0.19	4	1.05	0.53	1.81

10 ft. (heavy)	0.82	6	2.04	1.13	4.05
14 ft.	0.60	6	2.79	1.42	4.87
14 ft. (heavy)	0.97	6	3.89	2.14	7.06

*The table is based on data of the Westinghouse Electric & Manufacturing Company. See also "Handbook of Machine Shop Electricity," by C. E. Clewell, McGraw-Hill Book Company, pp. 430-432.

ment is warranted, it is well to test out the results with graphic instruments and to base the comparison on exact rather than generalized data. The fact that machine-tool builders tend to the adoption of motor drive for new machines, at least for the larger planers, is an indication that its advantages for this class of apparatus are beginning to be recognized by the trade.

Design of Rotor Cores for Electrical Machines

Development of Formulas for Figuring Stresses in High-Speed Rotor-Core Punchings
—Chart Which Makes Computation Simple—Determining
Stresses in Bored and Solid Disks

BY WILLIAM KNIGHT

THE object of this paper is to develop a formula for figuring stresses in core punchings of high-speed rotors due to the centrifugal force of the rotor coils held in slots at the periphery of the core and also to the centrifugal force of the punchings themselves. Both the case of punchings with a hole at the center and that of solid punchings (no hole at the center) will be considered. In the case of punchings with a central hole for mounting on a shaft or a spider the force-fit needed at the bore to assure proper operation at the maximum speed for which the machine is designed will be given.

The following symbols will be used in the calculation:

σ_r and σ_t = radial and tangential stresses at any point of a rotating thin-steel disk of uniform thickness due to the centrifugal force of its own mass and the centrifugal force of projecting masses attached at the periphery.

σ_r' and σ_t' = radial and tangential stresses at any point of a rotating thin-steel disk of uniform thickness due to the centrifugal force of its own mass only.

σ_r'' and σ_t'' = radial and tangential stress at any point of a rotating thin-steel disk of uniform thickness due to the centrifugal force of projecting masses attached at the periphery.

T = tangential stress of a thin-steel ring rotating at the same speed as the peripheral speed of the disk.

F = centrifugal force of projecting masses per square inch of outer surface of the disk.

R = outside radius of disk.

r = radius at the bore of the disk.

x = radius at any point.

E = modulus of elasticity of material = 30,000,000.

ν = Poisson's ratio, for steel = 0.3.

N = revolutions per minute at the maximum speed.

In "Steam Turbines" Dr. Stodola gives the two following general equations for disks:

$$\sigma_r = \frac{E}{1-\nu^2} [(3+\nu)ax^2 + (\psi_1 + \nu)b_1x^{\psi_1-1} + (\psi_2 + \nu)b_2x^{\psi_2-1}] \quad (1)$$

$$\sigma_t = \frac{E}{1-\nu^2} [(1+3\nu)ax^2 + (1+\psi_1\nu)b_1x^{\psi_1-1} + (1+\psi_2\nu)b_2x^{\psi_2-1}] \quad (2)$$

where, in the case of a disk of uniform thickness, $\psi_1 = 1$; $\psi_2 = -1$; $a = -3 \times 10^{-4} \times N^2$, and b_1 and b_2 are two constants depending on the outline of the disk and on the presence or absence of other forces acting on the disk besides the centrifugal force of its own mass. In this case the additional force is due to projecting masses attached at the periphery.

The two constants b_1 and b_2 may be determined for the particular case under consideration and the two formulas then expressed in such a form that anybody who is not familiar with elaborate mathematical manipulation can use them, thus saving time and eliminating chances of making errors.

Letting R equal the radius of the punchings at the bottom of the slot for the time being, $m = x/R$ and $m_o = r/R$.

Calling W the weight of the length of coils and insulation carried in the slots, and R' the radius of the center of gravity of this weight, n the number of punchings in the core and t the thickness, the centrifugal force of the projecting masses per square inch of outer surface of the disk will be: $F = (0.000341 \times WR'N^2)/2\pi Rnt$. Also, the tangential stress of a thin-steel ring of radius R and rotating at the speed of N revolutions per minute is: $T = 8 \times 10^{-6} \times R^2N^2$.

After making the necessary substitutions in formula (1),

$$\sigma_r = -0.408Tm^2 + 43 \times 10^6b_1 - (23.1 \times 10^6b_2)/R^2m^2.$$

To simplify the development of a readily usable formula it will be assumed that at N revolutions per minute the bore of the punchings will have expanded an amount equal to the initial difference in the diameters of the shaft, or spider, and punchings bore. Thus the initial radial pressure at the bore produced by the force-fit is zero at N r.p.m.

At the outside radius of the punchings the radial stress at N r.p.m. is evidently F . At the bore $m = m_o$ and at the periphery $m = 1$. Substituting in the preceding formula for σ_r ,

$$O = -0.408Tm_o^2 + 43 \times 10^6b_1 - (23.1 \times 10^6b_2)/R^2m_o^2 \text{ at the bore.}$$

$$F = -0.408T + 43 \times 10^6b_1 - (23.1 \times 10^6b_2)/R^2 \text{ at the periphery.}$$

From these equations the two unknown values b_1 and b_2 can be derived and substituted in formulas (1) and (2), giving when simplified:

$$\sigma_r = T[0.408(1 + m_o^2 - m^2 - (m_o^2/m^2))] + F \frac{1 - (m_o^2/m^2)}{1 - m_o^2} \quad (3)$$

$$\sigma_t = T[0.408(1 + m_o^2 + (m_o^2/m^2)) - 0.234m^2] + F \frac{m^2 + m_o^2}{m^2(1 - m_o^2)} \quad (4)$$

In both formulas it may be seen that the first term depends on the material of the disk only and is not affected at all by the centrifugal force of the projecting masses. The second term is a function of the centrifugal force of the projecting masses only, and is independent of the mass of the disk. Separating these two terms in both formulas (3) and (4) gives the radial and tangential stresses for the punchings only, as follows:

$$\sigma_r' = T[0.408(1 + m_o^2 - m^2 - (m_o^2/m^2))] \quad (5)$$

$$\sigma_t' = T[0.408(1 + m_o^2 + (m_o^2/m^2)) - 0.234m^2] \quad (6)$$

For the coils only,

$$\sigma_r'' = F \frac{1 - (m_o^2 m^2)}{1 - m_o^2} \quad (7)$$

$$\sigma_t'' = F \frac{m^2 + m_o^2}{m^2(1 - m_o^2)} \quad (8)$$

Formulas 5, 6, 7 and 8 are perfectly general and apply both to the case of disks with a central hole and to the case of a solid disk (no hole at the center).

STRESSES IN DISK WITH A CENTRAL HOLE

The tangential and the radial stresses at the bore and at the periphery are, in general, the most important to determine. By putting $m = m_o$ in the preceding formulas the stresses at the bore are obtained; by

CURVES WHICH SIMPLIFY THE CALCULATION OF TANGENTIAL STRESSES AT THE BORE AND PERIPHERY OF ROTOR PUNCHINGS WITH A CENTRAL HOLE

putting $m = 1$ those at the periphery are determined, giving:

$$\sigma_r' = 0 \text{ at the bore and at the periphery.}$$

$$\sigma_t' = T(0.816 + 0.174m_o^2) = (N/1000)^2 (6.6R^2 + 1.4r^2) \text{ at the bore.}$$

$$\sigma_t' = T(0.174 + 0.816m_o^2) = (N/1000)^2 (1.4R^2 + 6.6r^2) \text{ at the periphery.}$$

$$\sigma_r'' = 0 \text{ at the bore.}$$

$$\sigma_r'' = F \text{ at the periphery.}$$

$$\sigma_t'' = F \frac{2}{(1 - m_o^2)} \text{ at the bore.}$$

$$\sigma_t'' = F \frac{(1 + m_o^2)}{(1 - m_o^2)} \text{ at the periphery.}$$

STRESSES IN SOLID DISK

In the case of a solid disk with no hole at the center $m_o = 0$. Stresses at the center are obtained by putting $m = m_o = 0$, and stresses at the periphery are obtained by putting $m = 1$, giving:

$$\sigma_r' = \sigma_t' = 0.408T = (N/1000)^2 \times 3.3R^2 \text{ at the center.}$$

$$\sigma_r' = 0 \text{ at the periphery.}$$

$$\sigma_t' = 0.174T = (N/1000)^2 \times 1.4R^2 \text{ at the periphery.}$$

$$\sigma_r'' = \sigma_t'' = F \text{ at the center and at the periphery.}$$

In this way very simple formulas are given for both the tangential and the radial stress in thin disks at any point.

For the case of core punchings with a central hole all the elements are thus obtained which are needed for

specifying what the difference in diameter between shaft, or spider, and punchings bore needs to be in order to make sure that when the machine is running at the highest speed for which it is designed the expansion of the bore is just equal to, or a little less than, the initial force-fit. This condition is obtained by having a force-fit at the bore equal to

$$(\sigma_t' + \sigma_t'')2r/E = 2\sigma_r'/E.$$

In *Engineering* for Aug. 3, 1917, the author gave some general formulas for σ_r and σ_t for disks of uniform thickness and for disks of hyperbolic profile, such as are used for turbine wheels, with a hole at the center.

MAKING THREE ESTIMATES IN VALUATION RATE CASES

Engineering Bases and Methods Used by Illinois Commission in Arriving at Value of Property for Rate-Making Purposes

Bert H. Peck, electrical engineer Illinois Public Utilities Commission, speaking before a joint meeting of the Western Society of Engineers and the Chicago Section of the American Institute of Electrical Engineers recently, outlined the Illinois commission methods of making three estimates on value of property in rate cases. These estimates are based on original cost, reproduction cost and normal reproduction cost. The commission worked out methods and developed plans of meeting each problem, and these were discussed by Mr. Peck.

In what the commission terms normal reproduction cost estimate it endeavors to eliminate those elements of equipment or cost appearing in the strictly reproduction estimate which may cause the latter to reflect results abnormally high or low. By abnormal equipment is meant such equipment as conditions indicate is unsuited for the requirements. By abnormal prices is meant those prices which, owing to abnormal market or purchasing conditions, do not truthfully reflect a reasonable result. In the preparation of normal reproduction estimates the commission is not governed by rigid adherence to the inventory, although departure into the realm of speculation is not intended.

It may appear, continued the speaker, that the preparation of three estimates would operate to further becloud issues which often are unnecessarily hazy. The time required is certainly greater than would be required for one estimate, but the situation as a whole may be clarified considerably.

If but one estimate was to be prepared, and that upon reproduction basis, a careful and painstaking engineer would wish as complete data as to conditions surrounding original installation as were available and would also wish to know original costs of equipment so far as obtainable. Thus, even though preparing a reproduction valuation, he would usually secure all data necessary for original and normal estimates. If all available information has been secured the compilation of data of this nature into estimate form is not so serious a task as might be anticipated. Preparation of three estimates enables the engineer to view his problem from as many angles and to present sound engineering opinions to the judicial authorities rather than engineering opinions tempered by opinions of economic justice.

Cyclic Fluctuations in Rate of Lamp Renewal

Investigations Indicate that It Is Not Justifiable to Judge Life Performance from Resultant Renewal Data Unless These Data Cover a Period of More than Ordinary Duration

BY M. D. COOPER

Engineering Department National Lamp Works

HERETOFORE it has not been generally recognized that in a lighting installation of incandescent lamps variations or fluctuations in the rate of renewals may be expected. It is, of course, natural to expect that when an entire new installation of lamps is put into service the rate of renewal for some time will be very low and that ultimately the rate of renewal will increase to the value determined by the average hours' use of the lamps and the average life of the lamps. The fluctuations in the rate of renewal which may be expected to happen in the interval between the initial low rate of renewal and the final expected rate are represented in this analysis for the first time, the writer believes. It is quite surprising to find that the rate of renewal does not rise steadily to its final value but goes through wide cyclic changes, rising on its first peak to a value 40 per cent above its final expectancy and not settling down to practically steady conformance with the expectancy until after the lapse of a period corresponding to the consumption of three or four lamps per socket.

The solid-line curve of Fig. 1 is a mortality or survivor curve which has been derived from careful tests on a large number of 60-watt tungsten lamps, and although it does not apply exactly to all sizes of lamps, it is typical of what may be expected from the sizes most frequently used. This curve is a graphical means of expressing the fact that not all of a lot of lamps whose life rating is, for instance, 1000 hours can be expected to live exactly 1000 hours and then fail. A very small proportion of any lot of lamps can be expected to fail within a short period after installation, although these are compensated for in the average life by those which live beyond their rated life. At first the rate of mortality is very low and steadily increases up to a time shortly subsequent to the average life of the entire lot of lamps. From this time on the rate of mortality continuously decreases until the entire lot of lamps has failed. The dotted-line curve of Fig. 1 shows the rate of failure corresponding to the solid-line mortality curve.

ANALYSIS OF LAMP PERFORMANCE

To analyze what really happens, consider an entirely new installation of lamps and, for the time being, assume that the average hours' use per day for all lamps is the same. After dividing the life of the lamps up into a number of small periods, it is possible to determine from the mortality curve the number of renewals of the original lamps of the installation which will have to be made in each respective period. It is then possible to distribute these renewals among future periods in accordance with the mortality curve and, by continuing the process, to ascertain the total number of renewals which can be anticipated in each respective period in the future. Until the original lamps are well along

toward the end of their life, there will not be very many renewal lamps in the installation, and since the renewal lamps can be expected to survive the original lamps, the curve of the total rate of renewal (Fig. 2) will have a shape more or less closely approximating the shape of the rate of failure curve (Fig. 1) for some time after the installation is put into service. It may be noted that there is a peak of 40 per cent above normal in the total renewal curve at approximately 1300 hours, corresponding roughly to the first peak in the rate of failure curve (Fig. 1). Corresponding to the subsequent decline in the dotted line of Fig. 1, the total renewal curve shows a decided slump from the first peak.

The injection of new lamps into the installation at the high rate corresponding to the first peak will naturally bring about an abnormal rate of renewal at a time about one lamp life later. Owing to the distributing effect of deviation of individual lamp lives from the average, the second peak will not be so pronounced as the first. Likewise subsequent peaks will be still less prominent. As time progresses the oscillations of the rate of renewal above and below the normal value become less and less. Finally after 4000 or 5000 burning hours they become practically negligible.

In the preceding discussion it was assumed that the installation of lamps adheres to the mortality curve derived from test as shown in Fig. 1, or, in other words, that all of the lamps in the installation receive the same amount of burning per day. The effect of deviation from average in the burning hours of different lamps or of different parts of the installation is to straighten the resultant effective mortality curve. A mortality curve like the straight line of Fig. 3 is doubtless somewhat beyond the ultimate limit of the straightening effect of diversity in daily hours' use. For such a straight line mortality curve the rate of renewal will show cyclic variations as illustrated by Fig. 4. This curve differs from that of Fig. 2 in a number of details, although the same general characteristics are evident.

As an illustration of the smoothing-out effect on the mortality curve of diversity in hours' use of the lamps, a mortality curve is derived for the following distribution of lamps with respect to hours' use:

No. Lamps	Hours Per Day	No. Lamps	Hours Per Day
10.....	24	100.....	8
20.....	18	200.....	6
50.....	12	500.....	4
70.....	10	50.....	2
Total		1,000	Average 6

A comparison of the standard mortality curve and the mortality curve which obtains in this assumed installation is shown in Fig. 5. This mortality curve lies about halfway between the standard curve and the straight line of Fig. 3. The most significant difference is the attenuation of the lower end of the curve. This

attenuation would have the effect of rounding off the first sharp peak and trough of Fig. 4 and making the curve of total rate of renewal more nearly the same in shape as Fig. 2.

FIGS. 1 TO 4—MORTALITY AND SURVIVOR CURVES, AND CYCLIC VARIATIONS IN LAMP RENEWALS (SEE TEXT)

In deriving Fig. 2 uniform daily hours' use of the lamps is assumed, and Fig. 4 goes beyond the limit of possible effect of diversity in hours' use; therefore, a similar curve for any actual installation must lie somewhere between these two curves (Figs. 2 and 4). The two resultant curves of total rate of renewal show slight quantitative differences, although the qualitative

installation being renewed at one time, could be expected to bring about similar results, although of course in less degree.

If this discussion be extended to cover the possible effect of seasonal variations in the hours' use per day of a lighting installation, it may be seen that there is a possibility for even greater fluctuations in the total rate of renewal per month. As representative of average variations in hours' use per day of lighting installations, the following data from one of the largest central stations in this country are presented, showing the distribution of its annual lighting kilowatt-hour sales among the various months of the year:

FIG. 5—COMPARISON OF STANDARD MORTALITY CURVE WITH THAT OBTAINED IN ONE PARTICULAR INSTANCE (SEE TEXT)

conclusions from both are about the same, namely, that under perfectly normal conditions the rate of renewal in a new installation of incandescent lamps may be expected to undergo severe cyclic fluctuations and that

Month	Per Cent of Year	Per Cent of Average Month	Month	Per Cent of Year	Per Cent of Average Month
January	10.9	131	July	6.4	77
February	9.3	112	August	6.4	77
March	8.6	103	September	7.4	89
April	7.8	93	October	8.4	101
May	7.1	85	November	9.7	116
June	6.8	82	December	11.2	134

Even in the average for a great variety of lighting installations, the seasonal variation in the hours' use per day amounts to nearly as much as two to one, and in individual cases this variation from winter to summer use may be even more than two to one.

Applying the foregoing data on seasonal variation of hours' use per day, it can be seen that if the peak of the

rate of renewal curve as shown in Fig. 2 occurs in the winter and the succeeding trough of the curve occurs in the summer, the possible fluctuations in the monthly rate of renewal will run from 190 per cent to 55 per cent instead of from 140 per cent to 70 per cent as shown by the curve. Conversely, if the first peak should occur in summer and the succeeding trough in winter, the peak might be reduced to about 110 per cent of normal and the trough increased to 95 per cent of normal, thus very nearly eliminating the fluctuations of the first cycle.

The phenomena which have been discussed may offer a logical explanation of fluctuations in the rate of renewal of incandescent lamps which heretofore have been the cause of unfavorable speculation regarding the uniformity of the lamps. A manifest conclusion from the discussion is that it is not justifiable to judge the life performance of an installation of incandescent lamps from the resultant renewal data unless the renewal data cover a period of time sufficient for the averaging out of fluctuations in the rate of renewal caused by simultaneous replacement of all or a considerable proportion of the lamps in the installation.

ELECTRICAL PREPARATION FOR ORDNANCE BASE IN FRANCE

Importance of Electrical Equipment and Engineers in Preparations that Government Is Making for Our Army in France

Some idea of the extent to which electrical equipment and men qualified for electrical work are being required for the army may be obtained from recent advice regarding the American ordnance base depot now being built in France. This depot, which will be used for the repair and salvage of ordnance material, including cannon, guns, pistols, gun carriages, trucks, leather equipment, etc., will have over 2,500,000 sq. ft. (230,000 sq. m.) of floor space, will engage several thousand employees and require about 8000 kw. in electrical apparatus, principally motors and incandescent lamps, although electric furnaces will also be used in the shrinkage pits.

Energy will be received temporarily from some reliable electric system or systems in France, continuity of service being assured by the utilization of water power and by priority rights on fuel required for generating purposes. A power plant may also be built at the base depot to serve as a reserve. Gasoline and fuel oil are being considered for producing the motive power.

Although the electric service available is 50-cycle, three-phase, standard 60-cycle motors are being used and operated at the slightly lower rating resulting from the lower frequency. Except for large machines like boring lathes and grinders all of the machines are group-driven by alternating-current motors. The boring lathes are individually driven by direct-current motors. In the gun shop alone there are a large number of boring lathes measuring 30 in. to 48 in. (76.2 cm. to 121.9 cm.) in swing and 30 ft. to 60 ft. (9.1 m. to 18.3 m.) in bed length. The individual motors in many cases are mounted on concrete blocks beside the machines. Owing to the weight of most of the ordnance material handled, cranes will be used extensively.

In preparing for this depot the Ordnance Department had to determine where power was available in France

and in what quantities. Considerable information on this subject was obtained from the report by C. O. Mailloux on water-power development in France, while more detailed information was secured through investigating engineers in France. Practically all machine tools, motors and control apparatus were secured from this country through manufacturers who were able to turn out large quantities in a short period. In several cases equipment destined for other places was commandeered by the government for this depot.

Preparation for this depot as well as the present construction work are being carried out under the supervision of Major General William Crozier and Lieutenant Colonel D. M. King.

Electrical manufacturers who are in a position to supply government orders promptly and who desire to know the ordnance department's needs can address Colonel King, 613 G Street, N. W., Washington, D. C.

This department also requires the service of draftsmen, electrical engineers, electricians, dynamo tenders, both stationary and locomotive engineers and firemen, boiler inspectors, autogenous welders, etc. Pay ranges from \$30 to \$61.20 per month, depending upon demonstrated ability and place of service. Enlistment is for duration of the war only. In addition to the regular pay, free quarters, rations, clothing, bedding, medical and dental attention are provided by the government. Application blanks can be secured at the nearest recruiting office or by writing to the War Department, Office of the Chief of Ordnance, Enlisted Personnel Division, Washington, D. C. Applicants must be between thirty-one and forty years, citizens or declarants; must be able to speak, read and write the English language and should have no absolute dependents.

High-Speed Slip Rings

In order to meet the requirements for slip rings for high-speed dynamo-electric machinery as regards safety in service, it has been ordinary practice to employ material of very high tensile strength, permitting a sufficiently great safety factor. Materials possessing these qualities, however, have the characteristic of being of relatively poor conductivity, resulting in high ohmic losses, especially in case of machinery for large current strength as employed in electrochemical work. Also by reason of electrolytic phenomena troubles are liable to occur; for instance, copper will be carried off from the negative copper brushes and deposited upon the surface of a slip ring, this deposited copper on account of its unsuited structure resulting in a heavy sparking.

In consequence of this fact W. Gscheidlen of Berlin, in patent No. 1,243,286, suggests obviating the difficulties mentioned by employing as material for slip rings a metal strip, ribbon or band which is wound on edge to form a cylindrical spiral with firmly adjacent turns. A slip ring of this type of construction has a considerably higher tensile strength in peripheral direction than can be obtained in case the ring is made from cast or pressed material.

STANDARDIZATION OF LIGHTING CAN EXPEDITE SHIPBUILDING

Study of the Lighting of Vessels Where Construction Has Not Progressed to Point at Which Permanent Equipment Can Be Used

BY WILLIAM G. HEXAMER
Electrical Engineer Chester Shipbuilding Company

AS EVERY effort in this country must be bent toward expediting the building of ships, standardization of equipment should be seriously considered as one means to that end. Great opportunities are offered along this line in the standardization of the electrical equipment for the temporary lighting of vessels under construction, particularly where the same or similar types of ships are being built. This work may be divided into three subdivisions:

1. The permanent wiring on the permanent ways, which can be so constructed as to cover almost any electrical demand.

2. The lighting of vessels which have not as yet reached the stage of construction where a regular standardized temporary system can be installed.

3. The regular temporary wiring system, which must be so constructed that it can be repeatedly used from one vessel to another without much more than minor changes.

Considering these subjects consecutively, permanent ways can be wired from a three-wire 110-220 volt system. At the Chester (Pa.) Shipbuilding Company's plant it has been found advisable to run three No. 2 mains from a junction box at the head of the ways through 1¼-in. (3.16-cm.) conduit to a point where the water line makes it impracticable to continue. This covers practically two-thirds of the ways. At 20-ft. (6-m.) intervals in this line are installed YX condulets each containing a three to two-wire double-branch cut-out fitted for 30-amp. plug fuses. Two No. 8 wires feed a Q. H. A. condulet on each side of the ways through ¾-in. (1.86-cm.) conduit.

In conjunction with this system there is also installed at the head of the permanent stocks a Burns water-tight box containing a three-wire single-throw 100-amp. knife switch. The box is mounted at the approximate height of the new vessel's forecastle and is intended for temporary wiring when the vessel has reached that

specially designed plug board, with provision for ten outlets, is placed at the point of greatest demand in the Chester (Pa.) Shipbuilding Company's plant. The plug board is as nearly foolproof as one can be made, and is fed from a Q. H. A. receptacle by means of an R. Q. plug and the necessary length of two-wire deck cable. These boards are kept in stock, made up, and are a part of the standardized electrical equipment of the yard.

Portable taps made in 50-ft. (15-m.) lengths and equipped with specially designed plugs of very rugged construction are taken from the plug boards previously mentioned. The plugs are designed to be tapped into one of the outlets of the plug board. One end of the "portable" is attached to a weatherproof receptacle equipped with a 60-watt lamp and a locking guard. Carbon lamps are preferable for portable work as their filaments are more rugged, and, in the writer's opinion, riveters are not the gentlest of workmen.

As the writer's experience has been mostly with vessels containing six cylindrical tanks, the lighting of such vessels from the time that the decking is placed until the permanent electrical equipment is in service will be discussed. In the writer's estimation a tank vessel is one of the worst types to light in a proper way temporarily. After considerable experimenting a solution to the problems presented was reached. Upon the deck of the vessel—or, rather, at the edge of the main trunk deck—a set of No. 8 weatherproof mains is installed. The mains are mounted upon heavy porcelain knobs previously attached to a block about 2½ in. by 8 in. by 6 in. (6.35 cm. by 20.32 cm. by 15.25 cm.) and fastened to the edge of the trunk deck by means of a universal girder clamp. The blocks are made in large numbers and are kept in stock as part of the standard temporary equipment.

The mains are stretched on each side of the vessel and are fed from the permanent outlet previously described and installed at the head of the ways. This circuit is then again subdivided into four sections by means of 60-amp. single-throw knife switches. The sections are ordinarily connected but may be isolated to facilitate the finding of grounds. Ordinarily the switch at the stern is, of course, kept open, but it can be closed in case either side of the three-wire system is blown out, thus keeping the loop complete until re-

LIGHTING CIRCUITS ADVISABLE DURING SHIP CONSTRUCTION

stage of construction, making its own temporary system necessary. The permanent ways in this installation are approximately 430 ft. (170 m.) long.

Lighting of the hull while it is in the first stage of construction is of minor consideration, as there is usually plenty of daylight before the decking is placed. However, as double bottoms and various tanks reach completion temporary lighting by means of portable lamps is necessary. At this point of construction a

pairs can be made. While the switches previously mentioned are part of the standard temporary equipment, they are mounted in strongly made wooden boxes of weatherproof construction. The ordinary slate base switch is used with standard cartridge fuses.

From the mains the taps are taken for the plug boards and for a standardized temporary lighting unit, consisting of an X-5423 Benjamin shade, the usual suspension loop, a No. 1388 guard and a 200-watt nitrogen

amp. This unit is also used in the tank vessels. One unit is placed at the top of each cylindrical tank, one in each wing tank, three in the engine room, three in the fuel tanks and five in the forecastle, making thirty units in all. The units are so arranged electrically that the circuit is as nearly balanced as possible. These units are only for general illumination.

For close work the "portables" previously described are relied upon, one plug board being installed in each tank, and as the work progresses in the other portions of the vessel. As the plug boards have provisions for ten outlets and the standard "portable" has a length of 50 ft. (15 m.), quite a working radius is obtained.

The plug boards before mentioned are built in the yard and are each equipped with 20-amp. link fuses protected by an iron plate.

In freight vessels the problem is very much simplified as the hull is not subdivided as much as in tankers. While the standardized mains are used the general arrangement is much simpler, a single set of heavy mains installed down the center of the main deck being sufficient. Since fewer lighting units are used only half as many plug boards are required. To locate grounds it is, however, advisable to subdivide the mains as in the tankers and use ground detectors. The mains are of ample size for electrical drilling and reaming.

Credit and Collection Prospects for 1918

Strict Adherence to Terms, Better Credit Analysis and Demands on Customers for the Employment of Better Business Methods Are Certain to Be of Greater Importance than Ever

BY M. A. CURRAN

General Credit Manager Western Electric Company

THE prospects of credits and collections in the electrical industry for 1918 must, it seems to the writer, be judged, first, from these prospects for the country's business at large and, second, from the position the electrical industry will occupy as an essential to the war. The country's business at large has been going through a period of readjustment since our participation in the war became assured, but rather slowly until the last few months, when it became more marked. It is likely that it will be much more rapid from now on and continue so until financially and industrially the nation is on a war basis.

The most apparent phase of this readjustment has been the change in the financial situation. From an easy banking condition and a fair investment market we find that the pendulum has swung backward swiftly though smoothly. The banks are ably taking on a heavier daily load, and the investment market is narrowing. The Federal Reserve banks, by exercising their rediscounting and note-issuing functions, are relieving the strain, but the investment market—and by this is not meant the speculator but the distributor of the country's new capital—does not show prospects of early improvement.

The war has the first call on raw products, labor, machinery, power, transportation, communication, etc., of the country. Our financial resources must necessarily go as far and as long as these.

Broadly speaking, as far as the electrical industry is mustered into the ranks just so far will it be assured of production, sales and finances, and as far as it sells to those similarly mustered will its credits and collections be good. This must not be interpreted as meaning that only those directly producing the sinews of war will enjoy good business conditions. We have learned that modern war requires a complex economic underpinning; hence many and various lines of business will share these good conditions. The credit manager's ability to distinguish the relative position of such concerns will be just as important a part of his credit analysis as his appraisal of assets and liabilities.

Government bonds and taxes will withdraw funds

from usual channels and disburse them into unusual ones. True, very little of these billions will leave this country, so at first glance it might seem that there will be just as much money as usual and that therefore business should be as usual. However, war is a waster, not a producer, of wealth, and geography does not mark the economic boundaries of different lines of business.

The government now has under consideration the formation of a committee to cope with the disbursement of capital for necessary financing similar to the one established in England for the same purpose. Such action, it appears, will probably take place, and from this we may expect relief to some extent for the public utility confronted with a narrowing margin of net and the necessity of funding or renewing maturing stocks and bonds, as well as extensions not paid for, or those which are necessary or to which they are irretrievably committed.

The government, through its Federal Reserve banks, principally by issuing Federal Reserve currency against rediscounted paper, of which an important element will be trade acceptances, will largely meet the credit and currency requirements for the distribution of commodities in process toward consumption.

The government by various means will stabilize conditions considerably, and generally promote as active a business situation as possible; but it must be remembered that there is a point beyond which it is economically impossible for any government to become effective. For instance, consider the war savings stamps. It is aimed to raise two billion dollars on these, and practically all of it will come out of the wage earners' small change, which has heretofore been spent in retail establishments catering to him. This expenditure the average American wage earner will reduce largely, and the writer can think of no way in which the government can help these retailers.

Analyses of failure show that overbuying, underfinancing, improper or no accounting, excessive overhead, slow turnovers and unwise credits constitute the bulk of the causes. Business, largely because of unintelligent competition, has tolerated or fostered their

growth—whether knowingly or otherwise does not matter in present circumstances. Each business will have to prove its case, and internal efficiency will be its principal evidence at the bar of economics. We will all have to do, not a little more, but a whole lot better than ever before, and that idea must be sold throughout the trade. There never was a better time for the constructive credit manager to drive home to his customers the importance of intelligent accounting, buying and merchandising, reduced overhead and faster turnovers.

There never was a better time for absolute frankness between debtor and creditor. Many customers are reluctant to give adequate details of their business affairs, and credit managers have passed their orders on more or less sketchy deductions. Customers have likewise been indulged in terms, in many cases the necessity lying not in the nature of the business itself but in the faulty administration of the man. The principal premise for credit in many cases has been the so-called moral quality of the risk—the disposition toward fair and honest dealing. This quality is still highly valuable, but it will need support, that of the ability as well as the will to meet the obligation.

During the business boom of the last few years credit surveillance relaxed, and credit, always cheap in this country, became cheaper still. True, bills were paid, but then it was comparatively easy to pay them. Credit, in sympathy with economic conditions, is going up in price, and that price, I believe, must be as much ability backed by performance as quick assets over liabilities. There will be no room in the era ahead of us for catch-as-catch-can credits.

We, the creditor, the debtor, the business man, without distinction as to character or size of business, have all the common will to win this war and do not hesitate to enlist our efforts and wealth willingly, because we recognize the necessity of concerted action. That's our understanding of patriotism. Sound business is always good citizenship in times of peace as well as war, but it has not been widely enough so recognized. It now becomes a necessity, and therein lies our opportunity for patriotic service, and there should be the same feeling of common cause. It is not emotional patriotism we need now, it is the stern, solid, thinking kind that fully comprehends the task and has the will and the strength to do.

DEEPER CREDIT ANALYSIS NECESSARY

The customer who pleads some general business condition as the cause of non-payment of his bills is well known. Credit men may have analyzed a few such cases and found that this condition touched the customers' affairs only remotely, if at all, and even then the difficulty could generally have been overcome if they had not been brought up in the habit of following the line of least resistance with creditors. The trouble has been that these excuses have not been tested often enough. It is likely that the industry will be confronted with many such customers as business adjustment goes on, and while there will still be liberal consideration, the debtor must prove his case. The former habit of holding a brief for him will be out of date.

Financial statements should be more freely given and taken. Their analysis should extend much further than a mere reduction of net worth or quick assets versus quick liabilities. The character of the business, the

ability of the management, are going to be larger factors than formerly in determining the duration of that net worth and how long the assets will remain quick. What the business has done in past years is not going to be a safe guide to what it will do. The writer believes that, where the ability of the management has been evidenced in the past, that ability will carry the business further during these times than net worth alone. Due consideration should likewise be given to withdrawals for dividends or profits to proprietors, likewise to recent plant extensions which may become useless and unsalable or non-convertible.

Another question which credit men will have to consider will be the financing of the excess profits tax. This will be more difficult for those businesses which have made good earnings but are confronted with unfavorable conditions because of the nature of the business. There are many other questions which will arise as each case presents itself, and the writer would recommend that an answer to each be written by the credit manager on each statement for his own information. Every one has had accounts disastrous for himself as well as the debtor where a knowledge of the situation and its frank discussion would have saved a good business and a good customer. Now more than ever is the time for such knowledge and discussion.

TERMS MUST BE STRICT ON F. O. B. SHIPPING POINT

Government control of supplies will likely result in a generally smaller merchandise investment actually on hand, but delays in transportation will correspondingly increase the merchandise book account, as they will also increase the creditors' receivables. This latter will naturally result in an increased line of credit to each account as the merchandise will be longer in transportation between date of billing and due date of bill. Strict adherence to terms of payment by the debtor on goods sold F. O. B. shipping point will be the creditor's only relief from carrying all the contingencies of the transportation situation.

Recently some businesses, principally retailers in other lines than electrical, have advertised that they would take Liberty bonds in settlement of sales. We all recognize the economic importance of these bonds being held as widely as possible. Aside from this consideration, it is not ethical, in view of the high purpose of these bonds, to reduce them to the medium of barter, common currency. If a customer must or will give up these bonds, they should be sold through the regular channels. Using these bonds in this way is worthy only in so far as paying one's bills is worthy and not otherwise possible.

Every one is full of American confidence. Some do not call it by as nice a name; but, call it boastfulness, cocksureness, headlong optimism, egotism or what, history shows that dividends have been regularly paid on American characteristics. Recent world developments indicate that civilization is in the melting pot, and from it may be expected political, social and economic changes for which history furnishes no precedent. There is one principle that can be relied upon. Business has been and always will be. What it will be rests upon our present stewardship, not only individually but collectively. We are all partners in a grand adventure, and only those who can hold up their end will remain in the firm.

STATION & OPERATING PRACTICE

A Department Devoted to Problems of Installation, Operation and Maintenance of Equipment for Economical Generation and Distribution of Electrical Energy

GETTING GOOD SAMPLES OF BOILER-FEED WATER

Instructions to Be Followed to Insure that the Water Received by the Laboratory Is a True Specimen

BY T. W. REYNOLDS

The following are instructions used by an Eastern company for taking and forwarding samples of boiler-feed water to the laboratory:

Before the bottle has left the laboratory it has been washed so that it needs only to be rinsed with the water which is to be sampled. Upon receipt of the bottle, remove it from the box, detach the tag and rinse the bottle thoroughly with the water which is to be sampled.

The sample should be collected in the bottle if possible, not in some other vessel and then transferred to the bottle. If drawn from a tap allow the water to run for a time before filling the bottle. If taken from a body of water immerse the bottle if possible below the surface and allow to fill for rinsing, and then fill again for sample. The water should be taken from that part of the body of water which most nearly represents the water in use or to be used. This may be at an intake pipe or in a stream from a part far enough from the bank to avoid water comparatively stagnant. Do not allow the water actually coming into the bottle to touch the hands. Fill the bottle to within 3 in. (7.6 cm.) of the top; twist the stopper securely into the bottle, and having attached an envelope with the necessary data, replace the bottle in its case and forward by express.

Most laboratories have a standard blank form calling for certain information, and this should be carefully prepared and filled out.

MILL PRODUCTION INCREASED BY REPLACING STEAM ENGINE

The Constant Even Speed Obtained from a Two-Speed Motor Has Resulted in a Noticeable Increase in Production of a Steel Mill

An example of the successful replacement of a steam engine by an electric motor is furnished by the installation in the plant of the Cleveland Hardware Company, Cleveland, Ohio, where drop forgings for automobiles and similar classes of service are manufactured.

For a period of thirty-five years the company had been operating a 9-in. (22.8-cm.) Merchant rolling mill belted to a steam engine which by this time had outlived its usefulness, and it was necessary to install a new drive, as breakdowns were becoming frequent. After a careful investigation into the best-type driving unit the unanimous decision was that an electric motor was the only logical solution of the problem. Absence of any trouble since the installation and an economy of operation better than was anticipated have resulted.

The motor is placed close to and connected by gears to the rolls, and this with the transformers and control constitutes all the apparatus necessary. Energy is obtained from the Cleveland Illuminating Company at 11,000 volts and is stepped down to 2200 volts.

The motor is of the wound-rotor type with a rating of 450 hp. at 900 r.p.m. and 360 hp. at 720 r.p.m. These synchronous speeds are obtained through a double winding designed to give the motor either eight or ten poles, according to the speed desired. The synchronous speeds of the motor are reduced to speeds of the mill shaft of 240 and 192 r.p.m. respectively by means of a herringbone-type gear drive which operates in oil in a completely inclosed case.

The motor shaft is connected to the pinion by means of a Nuttall spring-type flexible coupling especially designed for steel-mill service. A similar coupling con-

TWO-SPEED WOUND-ROTOR MOTOR DRIVING STEEL-MILL ROLLS

nects the gear to a 10-ton open-hearth steel flywheel 12 ft. (3.7 m.) in diameter, which is mounted on two extra heavy pillow blocks, the other end being connected to the rolling mill. The wheel is made in one piece with rectangular arms.

The control of the equipment is handled by a two-panel black enameled switchboard mounted on angle-iron framework. The switches for changing the windings on the motor from eight to ten poles are oil-immersed, one in the primary and one in the secondary circuit. Proper markings are placed thereon so that the mill operator can easily manipulate them. The primary breakers are mechanically interlocked in such a way that only one can be closed at a time.

In case it is necessary to stop the mill quickly, as in an emergency, the running breaker is tripped, which causes all the secondary breakers to open. The operator then closes the reverse breaker, thus quickly bringing the motor to rest.

An idea of the work being done by the mill may be gained from the following figures: In an average eight-hour shift the average tonnage of $\frac{5}{8}$ -in. (1.6-cm.) rounds from 4-in. by 4-in. (10.2-cm. by 10.2-cm.) billets, 90 lb. to 100 lb. (40.8 kg. to 44.9 kg.) weight, 25 per cent carbon, is 35 tons; $\frac{7}{8}$ -in. (2.2-cm.) squares, 45 tons; $1\frac{1}{4}$ -in. by $\frac{1}{4}$ -in. (4.4-cm. by 6-mm.) flats, 40 tons; 100 lb. to 135 lb. (44.9 kg. to 61.2 kg.), 5-in. by 5/16-in. (10.2-cm. by 8-mm.) flats, 35 tons; 2-in. by 3-in. (5.1-

cm. by 7.6 cm.), 40 lb. (18.1 kg.) weight, 15 per cent carbon, $\frac{3}{4}$ -in. by $\frac{1}{8}$ -in. (1.9-cm. by 3-mm.) flats, 15 tons; 50 lb. (22.7 kg.) weight, $\frac{3}{4}$ -in. by $\frac{3}{16}$ -in. (1.9-cm. by 5-mm.) flats, 20 tons; 40 lb. (18.1 kg.) weight, $\frac{3}{8}$ -in. (9.5-mm.) rounds, 20 tons; 55 lb. (24.9 kg.) weight, $\frac{1}{2}$ -in. by $\frac{3}{16}$ -in. (12.7-mm. by 8-mm.) ovals, 30 tons

UTILIZING EXISTING POLES FOR YARD-LIGHTING FIXTURES

Details of Economical Method for Constructing Fixtures for Use in Outside Yard or for Street-Lighting Work

Existing poles supporting wires for various purposes may be in locations advantageous for yard lighting or at least near enough to warrant their use for temporary lighting. In addition, there are cases where economy dictates the use of this method for street lighting. Furthermore, in running a new line it is often possible and practicable, having in mind such use, to locate the poles without an appreciable amount of extra wiring becoming necessary.

Referring to the accompanying drawing, two $\frac{3}{4}$ -in. (1.9-cm.) conduits are bent as shown and secured by clamps to the pole top. The necessary material for this work is four 2-in. by $\frac{1}{2}$ -in. (5.08-cm. by 1.27-cm.) iron straps bent to the circumference of the pole and four 2-in. by $\frac{3}{16}$ -in. (5.08-cm. by 4.8-cm.) iron straps bent around the conduit and fastened by $\frac{1}{2}$ -in. (1.27-cm.) lag screws to the pole. The conduit ends begin with T. & B. bushings and are connected about the center of the pole by means of a galvanized T-conduit from which a $\frac{1}{2}$ -in. (1.27-cm.) conduit is extended to the reflector. The latter is of steel and supported on two sides by $\frac{1}{4}$ -in. (3.2-mm.) iron straps bent around the $\frac{3}{4}$ -in.

METHOD OF USING LAMP-CIRCUIT CONDUIT TO SUPPORT LAMP AND REFLECTOR

(1.19-cm.) conduit uprights and bolted with $\frac{3}{16}$ -in. (0.48-mm.) bolts and lock-nuts.

The fixture should, of course, be made thoroughly weatherproof by the application of two coats of paint. There is no economy whatever in the paint-saving methods sometimes employed.

INEXPENSIVE GIN SLED USED FOR WINTER WORK

Wooden Poles and Broken Pieces of Poles May Be Utilized to Make an Outfit Designed for Raising A-Frame Towers

The accompanying illustration shows how a gin sled was made by the Iowa Railway & Light Company of Cedar Rapids, Iowa, for raising A-frame towers on a cross-country transmission line. Wooden poles that had

GIN SLED MADE OF OLD POLES WITH BENT ENDS

been broken and old poles that had ceased to be useful except as firewood or "deadmen" were used. This sled was made instead of a wagon because it was cheaper and could be made to stay on the ground better under a heavy pull on uneven ground. It was dragged on the snow or wet earth from pole to pole by a single team of horses. The team was also used on the fall line. When fences were encountered they were cut down to allow the sled to pass.

The runners of the sled were made from poles which had crooked ends to get the desirable "turned-up" characteristics of properly fashioned sled runners. Most of the joints in the sled were made with bolts which were salvaged when the sled was abandoned.

PREVENTING EXPLOSIONS IN BOILER FURNACES

Necessity of Special Consideration When Using Low-Grade Fuel—Apparent Causes and Methods of Prevention

BY GILBERT RUTHERFORD

Probably every one who has operated boilers has at some time encountered the furnace explosion that blows fire doors open and singes the fireman's hair with the hot flame or blows coal particles into his face or eyes. The incident is not uncommon and, although potentially a dangerous occurrence, fortunately in most cases causes only temporary disability. The use of so-called low-grade fuels at this time of coal scarcity and high prices for marketable coal tends to increase the seriousness of furnace explosions. A brief discussion of their cause and prevention, based on the writer's experience, may therefore be of value.

Furnace explosions happen either when the furnace door is opened or when it is closed. The reason for the

explosion is the same in both cases, but the manner in which the explosion is brought about is different in the two cases.

Consider an instance where a furnace is incased in a setting that is new and airtight so that air infiltration is eliminated by plastering up cracks and crevices, etc. No air enters above the fuel bed, and the furnace chamber is filled with combustible gases. The fire doors are closed and the furnace is operating, and at fairly low rate of combustion, which means comparatively high draft for a thick fuel bed. The fireman now opens the fire door to throw on some more coal or to look at the fire or rake it over. There being a difference of pressure between the inside and the outside of the furnace chamber, such that the air rushes from the outside to the inside, the air from the boiler room is caused to rush in immediately and mix with the combustible gases above the fire. Combustion occurs instantly and with such rapidity that it has an explosive effect, blowing out the gas and coal into the face of the fireman. The simplest remedy is to maintain balanced pressures, or nearly so, between the inside and outside of the furnace chamber.

Another common cause of explosion is in cases where the furnace doors are closed after being opened. Suppose a fireman throws a shovelful of slack coal—for example, anthracite dust—upon the fire. To prevent cooling the fires he opens the door wide, throws in the coal as quickly as possible and shuts the door again immediately. While the fire door is open the furnace settings fill with air, partially at least. The slack coal thrown on the fire spreads over the fuel bed and combustible gases are distilled. The gases rising from the fire may contain as much as 30 per cent of combustible. This mixes with the air entrained in the setting, the mixture becomes ignited, a small explosion occurs, and the fire door of the furnace is blown open with considerable force as a consequence.

DRILL ALL CROSS-ARMS

TO TAKE SPACE BOLTS

Found More Economical Inasmuch as Large Percentage of Arms Used in City Construction Are Involved in Double-Arm Pairs

In ordinary city construction most companies employ double arms at railroad and street railroad crossings, at corner poles or curves and at points where one or more wires dead-end. One company made a check of the number of double arms used in city construction, and it was surprising to find that in a typical commercial and industrial district 64.5 per cent of the arms in place were involved in double-arm pairs. In a typical residence district the percentage was somewhat less, being 58 per cent. This large number is, of course, due primarily to the number of lines dead-ended at double-pole corners.

It was decided at once that all cross-arms should be drilled for double arming or space bolts in the process of manufacture. The drilling of an 11/16-in. (1.7-cm.) hole in the side of the cross-arm at each end weakens the arm but little, and as side holes for through bolts and brace bolts must be drilled in manufacture, there is no increase in cost due to the drilling of the space-bolt holes. On the other hand, if this work is done in

the field the drilling is more expensive and is less likely to be done evenly. This is particularly true where it is desired to double-arm an existing single arm, and the work must be done on the pole. Where second-hand arms are reinstalled it will be found that the old field-drilled space-bolt holes seldom match, and new ones

SIX-PIN ARM WITH SPACE-BOLT HOLES AT ENDS

must consequently be drilled. With factory-drilled holes these difficulties are avoided.

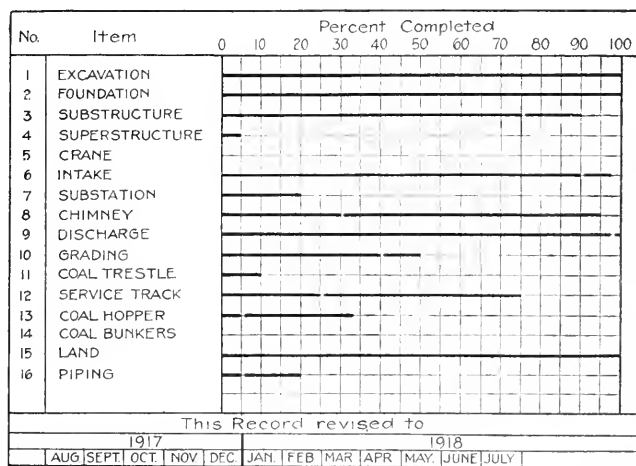

It is found good practice to place the double-arming bolts 5 1/2 in. (14 cm.) from the cross-arm ends. In N. E. L. A. standard four, six and eight-pin arms this puts the space bolts through the arm 1 1/2 in. (3.8 cm.) inside of the center line of the outside pins, as shown in the accompanying illustration.

COMPACT CENTRAL STATION

CHART TO RECORD PROGRESS

Method Is Found to Be Inexpensive, as an Original Tracing Can Be Altered at Any Time When This Is Desirable

A convenient progress chart used by the Turners Falls Power & Electric Company in connection with the construction of its new steam-turbine plant at Chicopee, Mass., is shown herewith. Work on the superstructure to Dec. 1, 1917, was classified under seventeen items from excavation to piping, the percentage of completion at any time being shown by solid heavy lines with breaks for monthly separation, together with the revision data. Two 15,000-kw. units will be first installed, but these have not yet appeared on the chart. The

INEXPENSIVE PROGRESS-RECORDING CHART USED IN A CENTRAL STATION IN A MASSACHUSETTS CITY

method is very inexpensive, as an original tracing can be altered at any time and new prints made to show conditions even under rapid changes.

R. E. Barrett is resident engineer in charge of the construction of the new steam-turbine plant of the Turners Falls Power & Electric Company.

CENTRAL STATION SERVICE

A Department Devoted to Commercial Policy and Management
Topics, Including Applications of Electric
Light, Power and Heat

IDEAS THAT UNDERLIE NEW HEADQUARTERS FOR UTILITY

How the Lobby of a New Building for the Minneapolis General Electric Company Was Constructed to Help Carry Out Company Policy

Larger quarters for the Minneapolis (Minn.) General Electric Company were made necessary when the company so far outgrew its former housing that ordinary routine business could not be handled. In designing the new quarters the company's executives did not overlook the fact that the place in which several thousand customers pay their bills affords a great opportunity to advertise electric appliances. The lobby of the new building was designed to take care of these opportunities.

It is not the company's policy actively to engage in merchandising, but rather to do all it can toward advertising appliances. This does not mean that the company will not sell appliances. It does mean, however, that it pays more attention to making an attractive and impressive display and to interesting the thousands of people who visit the lobby each month than to the actual sale of devices from its own shop. That this plan works as intended is shown by the fact that dealers constantly tell the company of inquiries from buyers who have seen some device at the electric company's shop.

The company does not cut prices, sell on installments, employ any system of mail solicitation, or employ salesmen to sell appliances outside the showrooms. List

played a number of the larger electrical devices, such as washing machines, mangles, sewing machines, etc., most of which are placed there by electrical dealers for demonstration purposes. In this way the new lobby has been utilized to apprise patrons of electrical conveniences and to help the local dealers make sales.

Another idea back of the layout of the lobby had to do with the possibility of impressing upon customers the company's policy of interest in their well-being. It has been found that no mistake was made in estimating the advantage the new lobby would give in this direction. To carry out this plan one section of the lobby is fitted as a waiting room, with a large table, ladies' writing desk, telephones, etc. Another feature is the information desk in charge of a competent man prepared to meet the public and not only to impart the desired information but also to give customers the feeling that the company wishes to devote some time to their personal attention. In commenting on this information desk, H. E. Young, sales manager of the company, said:

We have many inquiries a day at this desk and the conversations which we are able to have with these thousands of people give us a very valuable source of information as to how the public feels with reference to our company. We obtain the opportunity of discovering immediately any complaint which the customer may have and of satisfying it, as well as any criticism which appears to be in the public mind with respect to our activities. It is evident that remarks concerning our business are valuable information for the company to have, as they give very good indications of how our company stands in the minds of a great many persons.

DESIGNING AND FURNISHING THE LOBBY OF THE CENTRAL STATION BUILDING TO ATTRACT CUSTOMERS

prices are maintained. A co-operative advertising service is issued with the bills. In this service each local dealer may advertise and is billed for the space he occupies at the exact cost of the space. The central station takes no space on this advertisement, but gives it all over to dealers. On the lobby floor there are dis-

By actual records we have found that every day we are able to discover from one to ten instances of customers who have had a more or less wrong impression of our company, and we are able to correct this. It is evident, therefore, that this amounts to several thousand cases of dissatisfaction in a year which have been removed.

Without this spacious and attractive lobby, therefore,

thousands of people would come into our building in a year's time, pay their bills and leave without getting a correct impression of what our company stands for.

One of the most valuable assets of the arrangement of large pieces of merchandise on the floor is the fact that our clerks are able to talk to hundreds of people every month, and not only introduce these devices into the home but show the customer our interest in being of service to him. Here again we run across many opportunities to relieve patrons of some particular misunderstanding they have had with our company and thereby make additional friends.

On the whole, this lobby is a new means of affording us an opportunity to come into proper contact with a great number of people and impress upon them our policy and our attitude. As a result our company will mean a great deal more to them than simply a cold-blooded business institution whose interest stops with the payment of the necessary money for service rendered.

NEW-BUSINESS PROGRAM FOR COMING SIX MONTHS

Appliance Sales and Keeping of Records That Will Assist in Getting Business at Later Date Are Features of Work

Late in the year 1917 the accompanying tentative program of work for the new-business department was worked out for a Wisconsin utility company operating in a city of something less than 30,000 population. The plan was developed with the idea that the activities of the department should be so controlled as to put on the lines business which would increase the income from existing investment and at the same time would pave the way for a big drive after other business at some future time when conditions are more favorable. The plan follows:

I. Make an analysis of appliance market, which involves calling on each individual residence customer, making a record of the appliances that each has, ascertaining whether they are in good condition and are being used. Explain appliances that customers are interested in and endeavor to interest them in appliances which they do not own.

While obtaining the above records:

1. Make record of unwired houses.
2. Solicit all houses on our lines that are wired but not connected, preferably those that have services already attached to the house.
3. Make record of most profitable line extensions, possible number of customers, etc., so that they can be given attention when we are in a position to make such extensions.
4. Make a record of customers having a minimum monthly bill, using these as "prospects" for additional appliances.
5. Especially solicit the custom of "long-hour burners," such as barber shops, pool-rooms, saloons, restaurants, hotels, confectionery stores, cigar stores, drug stores, etc., that use gas lighting.

6. Offer suggestions to other merchants for the improvement of their installations, endeavoring to raise the standards of illumination.

7. Keep in close touch with the various isolated plants, keeping of their breakdowns, etc., and getting any information which might assist us in selling them breakdown or complete service.

8. Make a record of power installations also in industrial appliance installations which should be of use to us in obtaining additional business along these lines.

II. Care for all complaints which are turned over by the accounting department or otherwise directed to this department for adjustment.

III. Salesroom: Call the attention of all people who sign applications at the office or come there to make complaints to our line of appliances, explaining appliances which are apparently new to the customer. If unable to sell them, take their names as "prospects."

Make exchange of Gem lamps. Keep record of incandescent lamps and appliance sales. Keep record of connections and disconnections, etc.

SCHEDULE FOR EXPENDITURES

1. Send circular letter to every customer on our lines featuring economy in time and operation, convenience, safety and cleanliness of electrical appliances, to be followed by a series of two or three "follow-up" letters, one of these to feature the practicability of electrical Christmas gifts. Approximate cost,	\$500.00
2. The use of space in one foreign-language and one English-language daily paper, featuring seasonal appliances, house wiring in season, commercial lighting, general policy letters, etc. Approximate cost.	500.00
3. Arrange for public lecture for woman's club and domestic science classes, together with demonstration of appliances and serving of electrically prepared refreshments. Approximate cost.	50.00
4. Furnish slides to four moving-picture theaters every week throughout the winter, featuring appliances, etc. Approximate cost	156.00
5. Provide for electric cottage during house-wiring season. Approximate cost	100.00
6. Provide more complete line of window accessories such as glass shelves, pedestals, etc., for window display purposes. Approximate cost	15.00
7. Erect talking electric sign similar to that of Merchants' Light & Heat Company of Indianapolis, also install electric flag. Electric sign and flag to be charged to ten years' advertising. Account for six months. . . .	20.00
Salaries and commission, approximately.	1,100.00
Total	\$2,441.00

This plan contemplates the expenditure of a sum amounting to about 1.1 per cent of the gross annual revenue of the company, which is about one-half the amount usually expended by the company in this class of work.

INTERRUPTION REPORT TO URGE BETTER SERVICE

Form Shows What Caused Outage and of What Consequence to the Public Service Company Each Interruption Proved to Be

The Central Illinois Public Service Company of Mattoon, Ill., has developed a standard form on which each service interruption is reported to the chief executive. Such a report is made each month and covers the company's entire property, comprising some 190 committees. The report sets forth the location of the trouble both as to the districts affected and as to the particular

[illegible]

A CONVENIENT RECORD OF SERVICE INTERRUPTIONS

portion of the system responsible for the outage. In addition to this it gives the number of customers affected and the time lost. From these data are computed the loss in customer-hours. From these facts and a knowledge of what would constitute 100 per cent perfect service there is computed a percentage representing the degree of perfection attained for that

month. Every outage, even though it is but momentary, is counted as an interruption.

Since reporting of this character has been in force there is a noticeable tendency for employees to endeavor to reduce outages to a much lower minimum, so that the service percentage is usually well above 99 per cent, which leaves remarkably little room for improvement.

THE PUBLIC IS SLOW

TO CONSERVE ELECTRICITY

Advertisements Asking Consumers to Aid Company in Combating the Coal Shortage Do Not Bring Quick Action

A Middle Western central station company recently published a large advertisement in one of its local Sunday papers setting forth the exact conditions which confronted the company and laying special emphasis upon the necessity for its patrons to conserve elec-

tricity. Part of the contents of the advertisement are given herewith.

In commenting upon the use of this advertising the executives of the company said:

"The most good from such an advertisement is in informing the public of the actual conditions that exist. The public usually responds very slowly to such requests.

"We have since the publication of the advertisement sent personal representatives about the city making the request directly to our consumers. Moreover, the local United States Fuel Administrator assisted in endeavoring to create interest in conservation. The best we can say, however, is that the public will co-operate with the central station very reluctantly. This does not mean that it did not co-operate, but it means that it has been slow in realizing the importance and absolute necessity of co-operation."

SHORTAGE OF ELECTRICITY

FOR POWER, LIGHT AND STREET RAILWAY PURPOSES

Electric Power Shortage

The electric power situation in ——— and the surrounding territory served by this company has become more acute. This is due to the fact that the existing equipment in our power stations cannot be operated at its full capacity because we have been unable to procure a good grade of coal. However much we may regret our inability to meet the demands upon us—and we most certainly do regret it—the situation must be squarely faced and steps taken to conserve the supply of electricity.

We request those who use electricity for power purposes to give their most earnest consideration to ways in which they can make a saving of current in their business.

We request those who use electricity for lighting purposes to burn fewer lights. Use only one light where formerly two were used.

The foregoing request is made only with a full knowledge of the gravity of the situation, and because we wish to render to all our patrons the best service which the circumstances will permit.

Our Coal Troubles

The coal we are now receiving is of the most inferior grade we have ever had experience with. Our firemen jokingly refer to it as "fireproof" coal because it is so full of dirt that it will barely catch fire. In fact, some actually had corn growing in it as it stood in the car when received, and tests made of the coal have shown it to contain as high as 26 per cent of non-combustible material.

It has been due to this fact that several times recently we have been forced to discontinue service to power customers, to operate cars at half speed for short periods and to operate a reduced number of tripper cars during the rush hours. The poor grade of coal makes it utterly impossible to operate our boilers at capacity and lowers the output of our power station system.

The present serious situation prevails throughout the country—this community is not alone in difficulty, but this company without help cannot attain the desired results. Relief can come only with your immediate and persistent co-operation.

ELECTRICITY VIEWED AS

THE ALLY OF AMERICA

Opportunity at Hand for Central Stations to Give Publicity to the Essential Character of the Electric Lighting Industry

In both the Christmas and New Year's special editions of the Salt Lake City papers the Utah Power & Light Company ran the accompanying advertisement calling attention to the part electricity is playing in winning the war.

The public is not apt to think much of the part that individual industries are taking in this world struggle unless the facts are brought to its attention. Had it

ELECTRICITY IN THE WAR FOR DEMOCRACY

not been for the large amount of publicity it is doubtful if the people of the United States would attach such importance to the shipbuilding industry, and the same is true of other great industries. Of no less importance or value is the electrical industry. The munition plants, the shipbuilding plants, the steel plants and all of the other great war plants depend on electricity to turn out their products.

Of this fact, however, the great public of the United States is not aware. It does not know because it has not had the opportunity to learn. Central stations have here the chance to create good-will and better public relations, besides helping the public to understand the war value of the electric lighting utility.

TECHNICAL THEORY & PRACTICE

Including a Digest of Important Articles Appearing in
the Scientific and Engineering Press
of the World

Generators, Motors and Transformers

Methods of Cooling Transformers.—ARTHUR PALME.—Starting with the early dry type of transformer, which depended upon natural draft to dissipate the heat generated in its windings and core, the author discusses the different types of transformer tanks that have been developed to meet the ever-increasing size and changing operating conditions of transformers—a development which has made possible the modern 8000-kva. self-cooling and the 14,000-kva. water-cooled, oil-insulated transformers.—*Power*, Dec. 25, 1917.

Static Transformer Construction.—G. HARLOW.—This subject is discussed under the following heads: Efficiency, subdivided into iron and copper loss; temperature rise; short-circuit conditions and regulation; magnetizing current; flash test and insulation of end turns, and quality of oil.—*Commonwealth Engineer*, Oct. 1, 1917.

Lamps and Lighting

Light Distribution from Projectors.—WALDO C. COLE.—The problem of just what light may be expected from a parabolic reflector under practical conditions is one which it is possible to work out mathematically, as is pointed out in the article. From these calculations it is obviously possible to figure out in advance just how many lamps would be needed to illuminate a given area to a given intensity.—*Journal of Electricity*, Dec. 15, 1917.

Electric Car Lighting.—This article gives a summary of the best practices of representative steam railroads in this country on the important subject of electric car lighting.—*Railway Electrical Engineer*, December, 1917.

Generation, Transmission and Distribution

Gas-Firing Boilers.—T. M. HUNTER.—The author brings out the fact that the gas firing of boilers now has a greater future than ever. Probably the time is not so far distant when the present method of burning coal, together with its valuable by-products, will be considered obsolete and possibly even illegal. It will then be replaced by some type of by-product or coal-distillation plant yielding gas, and this gas will without doubt be largely used for boiler-firing purposes.—*London Electrician*, Dec. 7, 1917.

Electrical Energy from Brown Coal.—Tests made by the City Council of Melbourne, Australia, in a furnace constructed along the lines of a Dutch oven indicate that there will be no difficulty in burning brown coal. With the use of a thick fuel bed a semi-producer form of combustion takes place, the volatile matter and moisture being driven off early and the former burned in the upper part of the furnace by the aid of the air admitted at the bridge. The tests proved that the boiler capacity as rated on the basis of black coal consumption was more than fully maintained with brown coal.—*Commonwealth Engineer*, Nov. 1, 1917.

General Utilization of Pulverized Coal.—H. G. BARNHURST.—From the author's presentation of this subject, there are no insuperable difficulties to overcome in the use of pulverized coal, but merely those which have always hampered the introduction of new methods. Pulverized coal is here to stay, for it is very closely allied to the conservation of national resources.—*Journal Engineers' Club of Philadelphia*, December, 1917.

Traction

New Cars for the Melbourne, Brunswick and Coburg Tramways.—STRUAN ROBERTSON.—Description of lightweight cars that give reasonable seating accommodations for use on this system. The main dimensions and particulars of the cars are given as well as the wiring diagram of contactor connections.—*Commonwealth Engineer*, Oct. 1, 1917.

Handling Electric Locomotives and Motor Cars.—An article on the methods used by representative roads to maintain electric rolling stock and train enginemen.—*Railway Electrical Engineer*, December, 1917.

Installations, Systems and Appliances

Annual Load-Relief Map—Peak-Load and Load Factor Analysis.—WILLIAM LEROY ROBERTSON.—This is a description of an annual load-relief map which is a device for visualizing the entire yearly load of central stations. A review of load characteristics, as exemplified by the annual load-relief map, is included. Notes on daylight saving relative to the decreasing of peak load and improvement in load factor are given. The article also includes an analysis of load factors as applied to base and top loads, demonstrating the large amount of idle capacity peculiar to central stations. The annual load-relief map is valuable in the study and exemplification of all matters having to do with the central-station loads.—*Proceedings A. I. E. E.*, December, 1917.

Electrical Cooking as Applied to Large Kitchens.—W. A. GILLOTT.—The author considers the future of this branch of electrical industry to depend, first, upon close co-operation between the supply company's engineer and the manufacturer, and, secondly, upon the interchange of ideas and experiences. He also points out that in drawing up a scheme for cooking in large kitchens the essential items are reliability, quick service and efficiency. When the working comparisons are considered electricity has sufficient advantages to outweigh any difference in capital cost. These are: (1) cleanliness and absence of fumes; (2) constant heating value; (3) reduced labor costs; (4) less floor space required; (5) economy in food; (6) saving on the renewal of kitchen utensils.—*London Electrician*, Dec. 7, 1917.

Conveyors and Elevators.—W. H. ATHERTON.—The development of the conveyor and elevator for the handling of coal is first outlined, and then the various requirements are considered in detail. Sufficient coal

storage is a vital matter for the power station and introduces problems which are conveniently solved by conveyors. The various types of conveyors and elevators for coal handling and ash handling are considered in some detail, and reference is also made to the suction method of removing ashes.—*London Electrician*, Dec. 14, 1917.

Small Electric Furnaces and Their Uses.—CHARLES R. DARLING.—The author describes typical forms of modern electric furnaces as well as the question of the best methods to follow in operating them.—*London Engineer*, Nov. 16, 1917.

Extensive Use of Heating Appliances in Switzerland.—Reports from various central stations in Switzerland emphasize an enormous increase in the use of electricity for private cooking and heating. The use of electricity for these purposes (coming at the time of day where demands for lighting are low) would be far greater if sufficient electrical cooking and heating appliances could be obtained from other countries. Switzerland looks to America to supply this need if arrangements for the exportation can be made in the United States.—*Schweizerische Wasserwirtschaft*, Nov. 10, 1917.

Charging Machines.—FRED G. SMITH.—Reference is made particularly to the use of charging machines in steel works. Such machines lead to a large saving in labor, as shown by typical cost figures. Owing to the number of independent movements that are required, the wiring is somewhat complicated and requires careful study to avoid annoying breakdown. Also, owing to severe conditions of service, the construction must be rugged. Illustrations are given of up-to-date machines.—*London Engineering*, Dec. 14, 1917.

Electric Heating of Industrial Plants.—F. RUTGERS.—In Switzerland coal is so expensive and the heating demands of industrial establishments so erratic that tests carried out in some plants with electric heaters supplied with hydroelectric energy have shown their desirability even at lower coal prices than obtain at present. Where live steam has to be used for heating it is at present nearly twice as expensive as electric heating from hydroelectric sources. Rooms which are rarely visited by employees can be maintained at medium temperatures simply by warming them during off-peak periods. Where a greater warmth is needed, as in workrooms, 20 to 40 calories are required for each cubic meter on cold winter days, and 15 to 25 calories on milder days. The heat produced by 1 kg. of coal as steam for heating is equal to 5 kw.-hr. to 5.5 kw.-hr. In one textile plant where air required for the drying of the yarn was formerly sent through masonry conduits past steam pipes and heated to 65 deg. it is now heated by eighteen electric resistance heaters. They are connected in series of three to one phase of a two-phase system. Behind the heaters are wire nets which are intended to catch and retain glowing particles or sparks in case of a short circuit. The air is heated to 55 deg. with an energy consumption of 200 kw. If necessary, the electric installation can handle more air and use 300 kw. This represents an hourly production of 258,000 calories. The installation was built by the Oerlikon Machine Manufacturing Company of Zurich and has given excellent satisfaction.—*Schweizerische Bauzeitung*, Nov. 24, 1917.

Wires, Wiring and Conduits

Calculating Electrical Conduits.—CURCHOD.—A method for the rapid calculation to an approximation sufficient in practical work of the section of copper conductors. Use is made of simple diagrams which represent the sections for different current strengths.—*Revue Générale de l'Electricité*, Nov. 24, 1917.

Electrophysics and Magnetism

Total Emission of X-Rays from Certain Metals.—C. S. BRAININ.—A study has been made of the total intensity of the X-ray emission from six metals, platinum, tungsten, silver, molybdenum, copper and cobalt, over a range of voltages extending from 5000 volts to about 33,000 volts. The relations between the energy radiated and the voltage and between the energy and the atomic weight were investigated; this includes a test of the validity of the equation $E = KAP^2$. Below 20,000 volts approximately the energy radiated by platinum and tungsten was found not be proportional to A and P^2 ; above this voltage, however, it was in agreement with the above equation. Molybdenum obeyed this relation throughout the range of voltages, and showed no deviation from this relation when the voltage was increased above the critical voltage from the K radiation. Copper and cobalt seemed to obey this relation below their critical voltages for the K radiations, but above those voltages their emission increased more rapidly than is required by the "voltage squared law." Silver also obeyed this law below the critical voltage for its characteristic K radiation, but above that voltage the emission energy increased less rapidly than is required by the "voltage squared law."—*Physical Review*, November, 1917.

X-Rays and the Structure of Crystallized and Amorphous Carbon.—Debye and Scherrer find, by the method of X-ray examination which they have perfected, that graphite and amorphous carbon are not essentially different, and that amorphous carbon is only graphite in so fine a subdivision that it is impossible to produce it by mechanical means.—*London Engineering*, Dec. 7, 1917.

Telegraphy, Telephony and Signals

Loading Coils Versus Repeaters.—W. N. FURTHMAN.—The author points out that properly designed and correctly installed loading coils are adequate for all long-distance work. In discussing the principles and uses of repeaters or amplifiers, it was pointed out that they are not absolutely required in transcontinental service.—*Telephone Engineer*, December, 1917.

Miscellaneous

England's and Germany's Faith in Electricity.—It is reported that great reliance is placed on intensive development of electric power by Germany as a means toward rapid reconstruction of industrial prosperity. According to the *London Electrical Industries*, England too feels confident of her electrical position. This journal says: "England is the most favorably situated country in the world for deriving public and private benefit from electrical progress. Our population is more conveniently distributed; our fuel supply is far richer and more accessible. England can if she chooses have a supply of electricity, laid on practically everywhere like water, cheaper than Germany or any other big country on earth, and with this priceless blessing

England can not only defy competition in a wide range of manufacturing industries but can bring about a wonderful revival of agriculture and abolish domestic drudgery. Whatever Germany can do we can do twice as well in this field if only our people will drop their pettifogging parochial notions of electrical development and support the establishment of single-minded administration from a broad national standpoint."—*London Electrical Industries*, Dec. 5, 1917.

New Method of Increasing the Evaporation in Boilers.—CARL HERING.—A new thermal principle in the boiling of water is described. The thin film of gas on the flame side of the water-boiling vessel offers an enormously high resistance to the flow of heat. By means of lugs on the flame side of the surface an artificial thermal resistance is established, which greatly increases the flow of heat, provided that these lugs are always proportioned in the proper manner.—*Power*, Jan. 1, 1918.

The Automatic Disposal of Ashes from Power Houses by Means of Ropeways.—J. WALWYN WHITE.—Although the immediate removal of ashes from the power house can be secured by various means, such as conveyors, telfers, suction plant, etc., the range of action of such devices is comparatively limited. If transportation over some distance is desired, then the problem is most easily solved by means of the ropeway. Such plant is efficient and costs but little in operation. A number of ropeway installations especially adapted for this purpose are described.—*London Electrician*, Dec. 14, 1917.

A Physical Interpretation of Entropy.—J. LAROUSSE.—This article has both a didactic and a technical interest—didactic because the author shows that entropy is, at least theoretically, measurable as a quantity of heat and is not merely a "colossal abstraction"; technical because the process of reasoning that is followed makes an excellent basis for the formulation of a simple and clear theory of thermal machines.—*Revue Générale de l'Electricité*, Dec. 1, 1917.

Use of Aluminum in the Electrical Industry.—JEAN ESCARD.—The author compares aluminum with copper conductors, finding that the former are less easily broken, by reason of their greater specific heat and greater surface radiation; that they have 1.67 times the conductivity of copper of the same weight; that insulation is less effective with aluminum because of its greater diameter, though this is a negligible consideration; that aluminum will withstand a heat intensity one-seventh greater than copper, and that from the point of view of susceptibility to puncture experience shows that with equal insulation fatigue it is possible to reduce the thickness of the insulating material when aluminum wires are used—an important factor in price reduction and a compensation for the increased diameter of the conductor. In winding armatures, etc., aluminum has the advantage that bare wire can be employed. Other uses are for electrodes for arc lamps (these are made with platinum points); for connecting wires between the interior filaments of incandescent lamps and the exterior contacts; in the manufacture of cells and batteries, and in making lightning arresters composed of one or more series of aluminum cones or conic basins filled with an electrolyte.—*Revue Générale de l'Electricité*, Dec. 8, 1917.

Cost of Electric Pig Iron.—Based on experiments at Trollhättan, 4 tons of pig iron should be produced per kilowatt-year in a plant using only one furnace, measuring the energy at the furnace. Figured on the amount of energy purchased, the output should be about 3.32 tons per kilowatt-year. Better results may be expected from a plant of two, three or four furnaces. With a plant of four furnaces, it is assumed that an efficiency of 92 per cent can be attained, and with two or three furnaces between 83 and 92 per cent respectively.—*London Engineering*, Dec. 14, 1917.

"COAL BUDGET" PLAN OF FUEL ADMINISTRATION

Vital Coal Needs of Public Utilities to Be Met 100 per Cent, but Consumers of Power to Be Asked to Curtail

The new "coal budget" plan of the United States Fuel Administration, announced in Washington this week, will not adversely affect the electrical industry, speaking broadly, according to statements made personally by Fuel Administrator Garfield to the Washington correspondent of the ELECTRICAL WORLD.

In discussing the new plan, Dr. Garfield pointed out that the statement outlining it, made public on Jan. 8, specifically promises that the coal needs of public utilities, such as power companies, will be filled at the rate of 100 per cent.

That there will be a curtailment of the supply of coal and consequently of power, however, is apparent by a reading of the statement and an analysis of the plan made by other Fuel Administration officials for the correspondent of the ELECTRICAL WORLD. In a few words, the intention of the plan is to cut down on non-essential production, so as to save coal. Thus all industries not absolutely essential to the conduct of the war, but which use electrical energy for power in manufacture, are being asked to curtail their production, and in that way there will be a curtailment of power and consequently of coal.

The brewing industry, as well as industries engaged in producing paint and varnish, wall paper, confectionery, artificial ice, boxboard and glassware, have already made voluntary reductions in production, and to the extent that electrical energy is used in these industries there will be a saving of power and of coal.

The Fuel Administration is now asking that all other industries which can cut down production of materials not essential for winning the war send representatives to Washington for conferences and announcement of patriotic purpose in curtailment of production. It is thought that in this way a reduction between 36,000,000 tons and 50,000,000 tons in 1918 is possible.

The official statement in regard to the plan promises that "fuel needed in 1918 for army and navy purposes, for munition works, for public utilities, for domestic consumers and for factories working on war material will be furnished to the extent of 100 per cent."

Dr. Garfield was asked whether the new "coal budget" plan of giving such public utilities as power companies 100 per cent of their coal requirements means that the Fuel Administration has now worked out a permanent policy for the treatment of the electrical industry for the duration of the war.

"Not in regard to electric lights," he answered. "That subject will be handled by the state administrators in the several communities in accordance with conditions in the various sections of the country."

EXECUTIVE COMMITTEEMEN OF CONTRACTORS' ASSOCIATION

Members Elected by Divisions to Perfect the Formal Organization of the New Association at St. Louis on Jan. 22

In preparation for the organization meeting of the new executive committee of the National Association of Electrical Contractors and Dealers to be held at the Missouri Athletic Club, St. Louis, on Jan. 22, as stated in last week's issue of the ELECTRICAL WORLD, members have been elected by the broad divisions provided for under the constitution. The newly elected members of the executive committee, as announced thus far, are:

Central Division.—Two years: G. M. Sanborn, Indianapolis, chairman; J. A. Fowler, Memphis; J. E. Sweeney, Waterloo, Iowa. One year: Robley S. Stearnes, New Orleans; W. I. Gray, Minneapolis; J. N. Pierce, Chicago.

Atlantic Division.—Two years: W. C. Peet, New York, chairman; W. K. Tuohey, Springfield, Mass.; M. E. Arnold, Philadelphia. One year: George M. Chapman, Waterbury, Conn.; T. H. McKinney, Atlanta, Ga.; Paul H. Jaehnig, Newark, N. J.

Pacific Division.—Names not yet announced.

CHICAGO MAY REDUCE INSPECTION DEPARTMENT

Electrical Inspection Department Claims to Be Self-Supporting and Declares There Is Still Much Inspection Work to Be Done

The Chicago City Council, in order to keep expenses within resources, has proposed, among various methods of retrenchment, to dispense with services of some electrical inspectors. This is evidently based upon decline in new building operations. Victor H. Tousley, chief electrical inspector, objects to such action being taken, declaring that the inspection bureau is self-sustaining and that its duties do not depend on building operations, but are largely concerned with the wiring of old buildings, with additional power and light installations in industrial plants, with constant reinspections to insure that safe work continues safe, with the oversight of illuminated signs, and with investigation of accidents and fires.

"At no time," Mr. Tousley said, "can any community afford to dispense with such a feature of prevention of loss of life and property as is represented by its electrical inspection bureau, especially when that bureau is self-supporting. At this time, and in a commercial and railway center such as Chicago, the thought of reducing such a bureau is beyond the understanding of those who are aware of the extreme dangers attached thereto. This is the time that the husbanding of all resources is of vital interest to the nation."

MANUFACTURERS' COMMITTEE
PERFECTS WAR ORGANIZATION

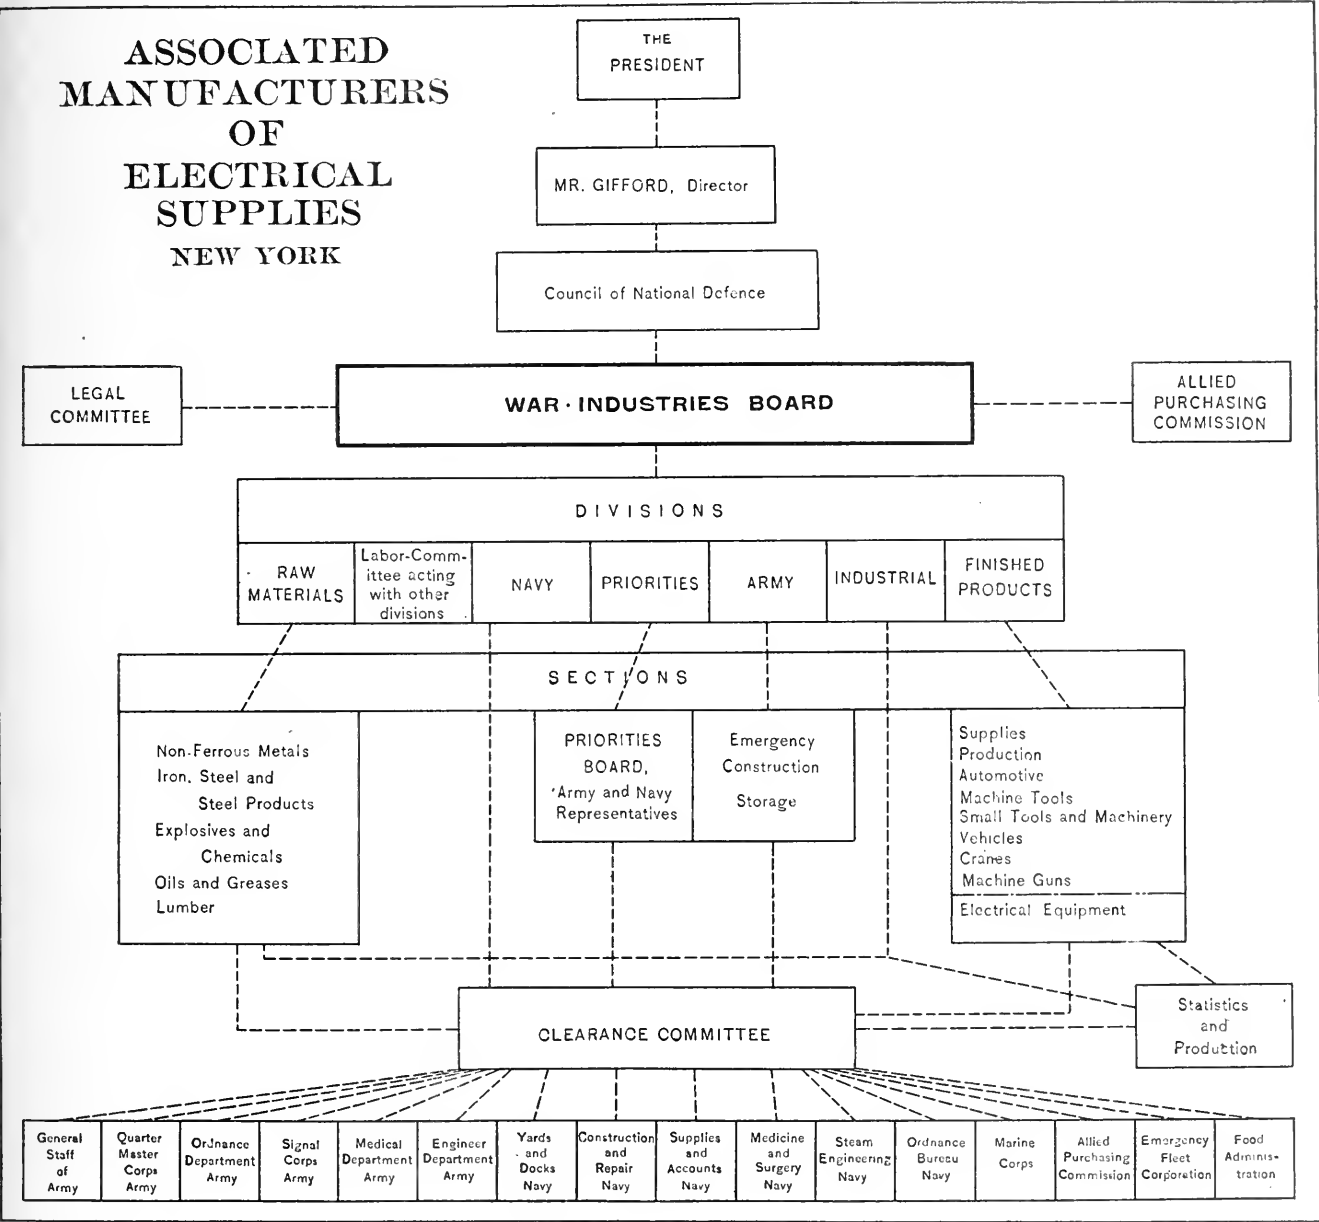

Federal War Service Committee of Electrical Manufacturing Industry Elects Chairman and Secretary-Treasurer

Permanent organization of the General War Service Committee of the Electrical Manufacturing Industry has been effected by the election of Robert K. Sheppard, Simplex Wire & Cable Company, as chairman, and W. W. Nichols, Allis-Chalmers Company, as secretary and treasurer. Mr. Sheppard is a representative of the Associated Manufacturers of Electrical Supplies on the general committee; the other representative of this association on the general committee is J. R. McKee, Gen-

Club on the general committee are Clarence L. Collens II, Reliance Electric & Engineering Company, and J. C. Hobart, Triumph Electric Company.

Mr. Sheppard and Mr. McKee, as stated, represent the Associated Manufacturers of Electrical Supplies on the General War Service Committee of the Electrical Manufacturing Industry. The war service committee within the Associated Manufacturers of Electrical Supplies is composed of Mr. Sheppard as chairman; Mr. McKee, H. W. Bliven, Harvey Hubbell, Inc.; Le Roy Clark, Safety Insulated Wire & Cable Company, and Charles L. Eidlitz, Metropolitan Electric Manufacturing Company.

The accompanying diagram has been presented at the various meetings of the Associated Manufacturers of

UNOFFICIAL DIAGRAM SHOWING IN SKELETON FORM THE ORGANIZATION OF THE WAR INDUSTRIES BOARD AS OF DEC. 6, 1917

eral Electric Company. Mr. Nichols is a representative of the Electrical Manufacturers' Club on the general committee; the other representative of that club is C. A. Terry, Westinghouse Electric & Manufacturing Company. The representatives of the Electric Power

Electrical Supplies to indicate the broad scope of the organization which has been developed at Washington to provide for government needs. The War Industries Board is designed to co-ordinate the activities of the various government departments.

RATE INCREASE IN COAL CLAUSE IN READING, PA.

Amendment to Schedules of the Metropolitan Edison Company Providing for Changes with the Cost of Coal

The Metropolitan Edison Company, Reading, Pa., has filed an amendment to its rate schedule, adding a coal clause, making changes in rates as follows:

The rates provided in Schedules G, I, K, L and M are based upon a price of \$3.25 for one ton of 2240 lb. of bituminous coal, delivered at the plant of the power company. Should the power company be obliged to pay more than \$3.50 per ton for coal delivered, for every additional 25 cents per ton in excess of said sum of \$3.50 the rate will be increased by an additional sum of \$0.00028 per kilowatt-hour of electricity consumed. In like manner, for every 25 cents paid per ton less than \$3 per ton, the rate shall be reduced \$0.00028 per kilowatt-hour of electricity consumed. Increases or decreases shall be calculated in 25-cent units only and fractional parts of said units shall not be considered.

The average price of coal, to be ascertained semi-annually on June 30 and Dec. 31 of each year from the books of the power company, and the increase or decrease of the cost of coal for the preceding term shall be the basis for ascertaining and fixing the amount of increase or decrease to be paid for electricity per kilowatt-hour during the next succeeding period or term of six months.

STATION INTERCONNECTION IN THE TEUTONIC EMPIRE

Progress in Linking Up Generating Systems in Central Europe as Well as in This Country and England

Numerous articles and editorials in the *ELECTRICAL WORLD* have told of the progress of plans for interconnection of generating stations in this country, which are being accelerated by the demands of war. The following translations from Central European papers indicate that a similar movement is in progress in the Central Powers:

According to the *Stuttgart Neues Tagblatt*, a meeting of representatives of all electric central stations in Württemberg, Germany, was held recently at Geislingen, at which it was decided to unite under a single management. Lines will be laid interconnecting the various power houses, and arrangements will be made for the most effective and economical production and distribution of the energy generated. A committee of representatives has been appointed to work out details for the incorporation of a separate distributing company which will handle the entire production and assign the quantities of energy to be produced by each. Although this situation has been created by the extraordinary war conditions, it is the intention of the committee to make the arrangement permanent if it proves satisfactory.

A bill has been passed in the Hungarian parliament, says the *Budapester Hirlap*, providing for the combination of all electric central stations of the country into one huge organization. A central management is to take hold of the work, and all cities and towns in Hungary will receive energy for lighting and power from it. The main object is to relieve power houses which are overworked and to assist those in which demand is not equal to the available supply.

NEW YORK COMPANIES SELL THE WAR SAVINGS STAMPS

Complete Organization at Branch Offices Effected Through a Gas and Electric Light, Heat and Power Group

Upon receipt of a communication from President J. W. Lieb of the National Electric Light Association, the New York gas and electric companies placed their facilities at the disposal of the New York director of the National War Savings Committee. Every one of the twenty-seven gas and electric companies in the metropolitan district has placed the war savings stamps on

Will Silver Serve

TO EMPLOYEES:
Make that 25 cents work for you and Uncle Sam - interest for you - war supplies for him - **BUY** - thru this Company's branch offices

War Savings Stamps

WAR-SAVINGS-STAMP POSTER USED BY UTILITY COMPANIES

sale at every office visited by consumers. The eleven electric companies are the following: Bronx Gas & Electric Company, Edison Electric Illuminating Company of Brooklyn, Flatbush Gas Company, New York Edison Company, New York & Queens Electric Light & Power Company, Northern Westchester Lighting Company, Peekskill Lighting & Railroad Company, Queens Borough Gas & Electric Company, Richmond Light & Railroad Company, United Electric Light & Power Company and Westchester Lighting Company.

Organization of the gas and electric companies for the sale of stamps was effected by Frank W. Smith, vice-president and general manager United Electric Light & Power Company, who has been appointed chairman of the gas and electric light, heat and power group for New York. The companies are:

First, acting as agents, offering the stamps at more than seventy offices.

Second, inclosing with bills and correspondence as well as distributing by hand to millions of customers literature describing the stamps and urging the public to buy them. The seventy offices display cards, posters and banners. Employees selling the stamps do not await inquiries, but suggest the purchase of stamps.

Third, bringing the stamps to the attention of employees by numerous articles. There has been appointed a director of war savings societies, whose duty is to encourage formation of these societies among employees, and a director of speakers, who is actively arranging for speakers to address employee organizations.

ADMINISTRATION BILL FOR WATER-POWER LEGISLATION

**President Wilson, at Conference with House Leaders,
Intrusts New Water-Power Bill to
Rules Committee**

President Wilson had a conference at the White House on the evening of Jan. 4 with members of various committees of the House of Representatives for the purpose of speeding up action in the House on water-power legislation. The President committed to the care of Representative Pou, chairman of the House rules committee, a member of the delegation which conferred with him, a copy of a new water-power bill, which will be known as the administration bill. This measure is one to co-ordinate legislation proposed for years in both houses of Congress dealing with water power not only on the public domain but in navigable streams; and the result of the White House conference, it is authoritatively stated in Washington, will be that the House rules committee will bring in a rule peremptorily requiring the House of Representatives to vote on and pass water-power legislation at an early date.

FINAL SHAPE OF LEGISLATION UNCERTAIN

What is to take place in regard to water-power legislation in the Senate is not yet known. That body passed the Shields water-power bill, a digest of which was printed in the *ELECTRICAL WORLD* of Dec. 22, page 1206, on Dec. 14, and there is a difference between that measure and the administration measure. The Shields measure, in fact, amends the act of 1906 to regulate construction of dams across navigable waters and does not deal with water powers on public lands. These are handled by a different Senate committee from the committee on commerce, which reported the Shields bill favorably. Many committees of both House and Senate have dealt with many different phases of proposed water-power legislation, and to this fact more than to any other consideration has been due the delay in passing water-power legislation which was promised to the country among the so-called "administration conservation measures" five years ago.

In the House of Representatives the red tape which has contributed to this delay seems in a fair way to be cut by the Presidential conference of Jan. 4, for President Wilson, who has had many conferences with House and Senate members and their differing committees without obtaining legislation, committed the new administration bill not to the chairmen of any of the House

committees dealing with water-power matters, but to the chairman of the rules committee. The President is reported by those who attended the conference to have explained with the greatest tact to the committee chairmen that, in view of the differences, he did not know which committee among the water-power committees to intrust with the bill, and that he would solve the problem by giving it to the rules committee, which, as official Washington views it, carried with it the plain implication, "Pass the bill!"

THE ADMINISTRATION BILL AND THE SENATE

Senators in charge of water-power legislation in the upper House are also expecting to have White House conferences. It is certain that the administration bill will be introduced in the Senate or that its provisions will come before a Senate committee in some form, so that when the House passes the administration bill there may be a conference between the House and the Senate. This will provide an opportunity to mold the differences between the administration bill, the Shields bill already passed by the Senate and any measure relating to public lands which may come from the lands committee of the Senate, in case there is no agreement in the Senate to substitute the administration bill for the Shields bill. It is not at all certain that senators will accept the administration bill, and there are some senators who will not fail to exercise the "I object" made famous by "senatorial courtesy" unless they can be made to see that the country imperatively demands legislation at once because of the coal and power shortage, which was President Wilson's motive in committing the new administration bill to the House rules committee.

Although most of the delay has been due to Congress, some is attributable to opposing views held by Cabinet members. These views have been reconciled in the new administration bill, which provides for a water-power commission composed of the Secretaries of the Interior, Agriculture and War. It provides for an executive officer of the commission, appointed by the President for five years; for the payment of rentals, a feature to which there has never been objection of consequence by any interest, and for licenses for water power on public lands as well as public streams for fifty years.

At the end of the license period the licensee will be allowed to renew the license and remain in undisturbed possession until the proposed commission shall have done one of three things:

1. Issue new licenses under laws applicable at that time.
2. Give licenses to new licensees who shall pay for the original fair value of the property.
3. Take the property over upon paying a fair value, the fair value defined to include all work and main transmission lines, plus severance damages for all property not taken over and damaged by reason of severance.

The new administration measure does not include any allowance for enhancement of values on land or water rights, or for any good will for a going concern, etc. It provides for alteration, amendment or repeal by Congress (Congress expressly reserving such rights), but in case of alteration, amendment or repeal such shall not extend to the licensees who have exercised rights or spent money under the bill.

The bill was drawn by General Black and Colonel

Keller, of the Army Engineer Corps, representing the War Department; Edward C. Finney, water-power expert for Secretary Lane, and former Representative Lathrop Brown of New York, now a special assistant to Secretary Lane, representing the Interior Department, and O. C. Merrill, chief engineer of the Forest Service, representing the Agricultural Department, who compiled several years ago a mammoth report on water-power companies, banking affiliations, etc.

Present at the White House conference on Jan. 4 were Thetus W. Sims, chairman of the House committee on interstate and foreign commerce, who recently succeeded Judge Adamson in that position; Scott Ferris, Oklahoma, chairman of the House public lands committee; Asbury F. Lever, South Carolina, chairman of the House agricultural committee, and Edward W. Pou, North Carolina, chairman of the House rules committee, as well as Finis J. Garrett, ranking member of the House rules committee. Representatives Garrett and Sims, as well as Senator Shields, are Tennesseans.

At the Presidential conference it was agreed that a committee of five members each from the House committees on interstate and foreign commerce, agriculture and public lands, fifteen in all, should be created to compose differences as to the various bills which have been under consideration heretofore in the House and to bring together such radical views as have been expressed by Representative Ferris during public debate on water powers, with more moderate views of others.

The committee of fifteen, it is felt in Washington, will be aided materially by the fact that after mature deliberation, advice and conference President Wilson himself has presented a bill upon which he believes all can agree.

COAL SHORTAGE STILL SERIOUS IN MICHIGAN

State Administrator, However, Expresses Belief that Abrogation of Priority Orders Together with Government Control of Operations Will Help

The coal shortage in Michigan has been exceedingly serious for the last month, and particularly during the two weeks just ended. By a supreme effort, however, most central stations have been kept in operation and at least partial service has been given. State Fuel Administrator W. K. Prudden and the county administrators have been unsparing in attempts to secure a sufficient amount of fuel.

A luncheon, presided over by John W. Brannan of the Detroit Edison Company, was held at the Detroit Athletic Club on Jan. 4, when heads of twenty-five of the largest coal-consuming factories in Detroit discussed the situation. They objected to having coal furnished from the Indiana fields instead of West Virginia and Kentucky. They contended that Kentucky and West Virginia coal is of much better quality and the freight rate is lower.

So far 913 street lamps have been discontinued in Detroit in order to conserve coal. The *Detroit Free Press* suggested that the number of lamps might be reduced to 8320 and that the city would then be lighted as well as in 1914, with an allowance for an increase of 25 per cent in population since that time. There were 11,074 lamps in use before the discontinuance of the 913.

At Holland the City Council adopted a resolution that the town should have two lightless nights per week, but this was rescinded because of danger from thieves and thugs and the cost of making necessary changes in equipment and lines.

Conditions at Lansing have been very acute and on Jan. 4 it was said that the supply had been practically exhausted, although many orders had not been filled. Many other towns were suffering in the same way.

Administrator Prudden had almost decided to limit hours of saloons, poolrooms, moving-picture shows and vaudeville theaters, and to ask that inside illumination of stores be discontinued after closing time and that churches hold union services.

Mr. Prudden expressed the belief that the abrogation of priority orders will aid materially in securing fuel for the State. He feels that relief will follow operation of railroads under government supervision.

INTERCONNECTION FORECAST BY MASSACHUSETTS BOARD

Power to Order Interconnection of Electric Generating Stations Sought by Massachusetts Commission from the Legislature as War Measure

Important additional powers are sought by the Massachusetts Gas and Electric Light Commission in its recommendations to the 1918 Legislature, including authority to order plant interconnections and to approve certain contracts for electric service.

The commission points out that the shortage and high cost of coal have revealed as never before the importance of cheap and reliable power to industrial as well as to community life. Considerable progress has been made by the companies in tying together electric generating stations, but the board holds that "in a great national emergency a matter so vital to the public interest should not rest entirely on the initiative of the companies."

To prevent unnecessary duplication of investment and to conserve natural fuel resources, the board recommends that it shall have authority after proper proceedings to require the physical connection of power stations and gas works, the supply of gas or electrical energy to other companies and municipal lighting plants, and the shutting down of such power plants and gas works as may be unnecessary, upon such terms and for such periods as may be just and reasonable, and to exercise the right of eminent domain wherever essential.

During the last two years the board devoted 127 days of hearings to arbitration of the price of street lighting furnished by the Edison Electric Illuminating Company of Boston to the city of Boston under a ten-year agreement concluded in December, 1914. The trial involved a very large expense for both city and company, all of which, the commission notes, must be borne sooner or later by the public.

"If, on the other hand, prices tentatively reached," says the commission, "or considered by the parties in such negotiations required the approval of the board before contracts for a term of years become effective, such extra expense would be avoided and such matters might be disposed of more summarily and with as close an approximation of justice to all concerned as after an exhaustive trial involving many disputed factors which

may affect costs, but with respect to the meaning of which even if an agreement be reached with respect to the facts men will honestly differ. Moreover, the local authorities enter upon such a negotiation at considerable disadvantage, rarely having had any experience with the problem." The commission recommends that contracts for street lighting for periods of more than one year should require its approval before becoming effective.

The tendency toward concentration of production of gas and electricity into large, well-located generating plants has made many companies distributors merely and not producers of gas and electricity. The terms upon which such distributing companies purchase gas or electricity are becoming a matter of vital interest to customers dependent upon them, in the opinion of the board, which says:

"Where the companies involved are independently owned self-interest may well be relied upon to obtain proper terms. When, however, the selling and purchasing companies have a common ownership, this element is wanting, and serious injustice may result, not only to the consumers but also to one or the other of the companies which are parties to such transactions. The board, therefore, recommends that contracts for the purchase and sale of gas and electricity between companies having a common ownership require its approval."

BEGIN HEARING ON THE CLEVELAND RATE CASE

**Company Officials Contend Before Ohio Commission
that Present Rates Do Not Yield Adequate
Returns on Property Value**

The hearing in the rate case of the Cleveland Electric Illuminating Company was begun before the Ohio Public Utilities Commission on Jan. 3.

Company representatives produced exhibits to prove that 3 cents is an inadequate maximum rate. The array of data apparently took the legal and engineering representatives of the city of Cleveland by surprise, as they asked for sixty days in which to prepare arguments and cross-question company witnesses. General Manager Robert Lindsay of the illuminating company said that a deficit has been shown since 1914, and pointed out that it would be still larger if the 3-cent rate should be adopted. Company officials said they regarded 8 per cent as a proper return on the valuation and that there should be an additional 3 per cent for deferred upkeep. The business at present is not yielding such a return, they said.

The valuation placed upon the company's property by the commission is \$19,661,242. The rate will be based upon this valuation unless the Ohio Supreme Court, to which it has been appealed, rules otherwise. The city contends that the commission had no right to allow the company to capitalize \$1,112,070 as the cost of attaching business; that it erred in deducting a depreciation of \$1,506,237 instead of \$2,048,186; that it allowed \$2,059,031 for interest during construction, when the actual amount should have been \$40,821, and that a mistake was made in not considering the actual cost of the property instead of the theoretical replacement value.

On the application of Director of Law Fitzgerald for an extension of time in which to prepare arguments

against the exhibits made, the commission set Jan. 29 for a continuation of the hearing. Engineer F. W. Ballard, employed by the city as an expert, will prepare figures to be used in an effort to disprove the exhibits.

STUDYING TO SPREAD THE PEAK-LOAD DEMAND

**Meeting of Officials of Utilities with Merchants and
Industrial Leaders in Springfield, Mass., to
Remedy Fuel Shortage Situation**

Plans to spread out peak loads, and thus reduce coal consumption by co-operation, are being discussed by officials of the United Electric Light Company and Springfield (Mass.) Street Railway with local merchants and industrial leaders.

At a recent meeting under the auspices of the Springfield committee of public safety, at the Springfield Chamber of Commerce, Walter L. Mulligan, general manager United Electric Light Company, submitted a company load curve for consideration, and emphasized the need of curtailing consumption, especially between 4 p. m. and 6 p. m., in industrial plants. H. M. Flanders, general manager of the railway; J. O. Halliday, superintendent of transportation, New Haven Railroad, and H. S. Knowlton, New England editor ELECTRICAL WORLD, were among the speakers. Fred T. Ley presided, and E. A. Carter, chairman of the local fuel committee, J. C. Robinson, chairman traffic committee, and R. W. Wright, chairman of the manufacturers' committee of the Chamber of Commerce, offered co-operation.

Mr. Mulligan stated that the United company has about 10,000 tons of coal on hand, sufficient for forty days; 60 per cent of the fuel burned is for power service. The shortage has been aggravated by lack of cars and the unwillingness of mine owners to accept coal prices fixed by the government. Low water in the rivers has curtailed hydroelectric production, both at the United company's plants and in the plants of large companies selling hydroelectric energy, so that the United company now receives only about 700 hp., instead of the 4000 hp. normally to be depended upon from river developments. At Indian Orchard the United company built a coal pocket early last year, costing \$70,000, and began purchasing all the coal it could get. Only about 10,000 tons could be obtained, and at an average cost of \$6.65, normal prices being about half this. The company's storage capacity in Springfield proper, at its downtown station, is about 6000 tons. On account of inadequate transportation conditions the company had to hire motor trucks to bring coal from Indian Orchard to the State Street station, Springfield, at a cost of \$300 per day.

The United company, Mr. Mulligan said, would like to see during the present emergency a larger reduction in sign and window lighting. The total station load on Dec. 17, 1917, on the afternoon half hours beginning at 3 o'clock, was: 3 p. m., 13,500 kw.; 3.30 p. m., 13,350 kw.; 4 p. m., 13,600 kw.; 4.30 p. m., 15,500 kw.; 5 p. m., 18,750 kw.; 5.30 p. m., 15,700 kw.; 6 p. m., 13,600 kw. It is estimated that from 25 tons to 50 tons per day could be saved by cutting off, say, 2000 kw. of the peak between 4 p. m. and 6 p. m. This might be accomplished by early closing of factories.

Mr. Flanders pointed out that the street railway

could not handle traffic if the industrial patronage should be thrown upon it at a single time, and suggested that by spreading the closing hours better results might be obtained. Representatives of manufacturing and commercial interests expressed agreement in any feasible co-operation, standing ready to accept any scheme of opening and closing which will help. The best of feeling was evident. A committee was appointed to work out detailed suggestions as to the best rearrangement of hours for different establishments, taking into account load conditions, character of output, essential nature of products, relation to street railway traffic problems, and other points.

Mr. Halliday discussed the difficulties of land and water transportation affecting New England, and Mr. Knowlton outlined the work of other New England communities and public utilities in fuel economy, emphasizing the importance of favorable water-power legislation by Congress, and touching upon fuel-saving possibilities by individual consumers of central-station service.

FACTORY WORK FOR MEN BLINDED IN WAR

Instruction of Blind Workers in Plant of Crocker-Wheeler Company Promises Excellent Humane Results for the Future

It is an old story that when a man or woman loses the power of sight he gains unusual skill with the fingers as partial compensation. This fact has made it possible for them to do excellent basket making, chair

DR. SCHUYLER SKAATS WHEELER INSTRUCTING BLIND WORKMAN HOW TO WIND COILS

caning and other manual work that requires quick fingers and patient effort. The difficulty has been that in the selling of most of these articles they had to compete with machine-made articles sold at a low price.

Another form of occupation ideally suited for these

men and women is being developed by the Crocker-Wheeler Company at its plant in Ampere, N. J. Coils for armatures and similar apparatus must be wound, and no machine has been devised that will do this as well as a workman can do it by hand. The coils of

BLIND WORKERS WINDING COILS

wire are wrapped with tape. Millions of these wire coils are used and their number is growing each year. Wrapping or insulating them with tape is a kind of work very similar to basket weaving and chair caning.

A workroom started about two months ago has already brought happiness into the lives of a group of blind men and women. They have learned to do the work and have almost attained the speed of a normal worker.

When these are proficient they will return to their various countries and carry on the work of making the blind self-supporting by instructing the war blind.

STORM AND LIGHTLESS NIGHT DARKEN CHICAGO'S STREETS

Worst Blizzard Since 1884 Ties Up Four States in the Middle West and Street Lighting Suffers—
Coal Shortage Feared

What is reputed to be the worst blizzard since the winter of 1884 struck Illinois, Iowa, Wisconsin, Michigan and part of Indiana on Sunday, Jan. 6.

The temperature hung around 25 above zero, and the wind, varying from 40 to 60 miles an hour, caused the snow, which lay from 13 in. to 20 in. (23 cm. to 50 cm.) on the streets, to drift to heights of 10 ft. (3 m.) in some places. Most streets in Chicago were under drifts 3 ft. deep, and along some railroad rights-of-way the drifts were deeper. In many instances long-distance telephone communication was cut off. Surface lines and suburban steam railroads moved almost no trains on Sunday and established only very limited service on Monday.

As Sunday was a lightless night, the street-lighting situation was extremely bad. On account of wire trouble about one-half of the street lamps in Chicago were out. This, added to the fact that all display illumination was turned off, made the Chicago newspapers remark that "it was somewhat dangerous for persons to venture into the streets."

FUEL SUPPLY IS SHORT: WAYS TO CONSERVE IT

Chamber of Commerce Committee on Coal Conservation Working to Encourage Small Economies in Hope of Large Results

Under the title "Small Savings That Count," the committee on coal conservation of the United States Chamber of Commerce has issued a letter to members, in part as follows:

The shortage of coal for every day of the ensuing year amounts to about forty ounces or two and one-half pounds for every man, woman and child in the United States. Great economies in the use of coal will be effected by the factories, the central heating, lighting and power plants and the railroads. But small savings must not be neglected. Some opportunity is presented to every person every day to save coal by reducing the consumption of heat, light or power. The responsibility for making these savings is widely diffused among millions of people. The aggregate importance of them is correspondingly great.

Every ounce of coal saved is an outright contribution to the nation's war-time need for fuel. Some persons may easily save their entire quota of forty ounces each day. The following schedule suggests some of the means for saving small quantities of coal. These savings, in the aggregate, will set free thousands of tons of coal for the industries of the country, for the railroads, for the navy, and for the ships that carry our men and supplies to France.

Conserve electric light. Electric energy usually comes from coal. Consult your dealer as to the most economical types of lamps suitable to your conditions and fixtures. A 25-watt lamp used instead of a 40-watt lamp saves at least an ounce of coal every two hours.

Turn lights off when not needed. If a 25-watt lamp or an ordinary gas light is turned off, even for short intervals, the saving may be an ounce of coal a day for each lamp.

Discard carbon-filament lamps. Substituting a 25-watt tungsten lamp for a 16-cp. carbon-filament lamp provides a better light and saves two or three ounces of coal daily.

Attend to the lubrication of machinery. A drop of oil will often save an ounce of coal. Careful attention to the lubrication of all working parts of machinery will save many pounds of coal in the day.

Do not superheat rooms. Observing the thermometer and turning off radiators to hold the temperature below 70 deg. Fahr. reduces the load on the heating plant.

Conserve all heat and power. Keep in mind that every loss of heat or power is a loss of coal. A leak in a steam connection and a superheated office room are alike the cause of wasted coal. Keeping a heavy power unit in operation when a lighter one would carry the load wastes coal, and so does all unnecessary use of electric elevators.

Use weather stripping and storm windows. A bit of weather stripping about the door and the use of storm windows in offices, schools and all buildings that are heated will reduce the burden on the heating plant and make effective a daily saving of coal.

Discourage electric display illumination. This use of coal is not absolutely necessary. The genius for advertising which originated this excellent method of display should find temporarily other means of expression. Eliminating or forgoing an electric sign may save tons of coal a year.

These methods of saving heat, light and power are not unfamiliar. Every one, perhaps, will think of some effective means of saving which is not included in this list. The important idea to be impressed on every person is that a great need exists for saving coal and that even small savings must not be overlooked.

Saving coal is not always identical with economy to the person effecting the saving. It may be some one else's coal that is saved, or the time and expense required to effect the saving may offset the money advantage. Nevertheless, it is a patriotic duty now to save coal at any reasonable expenditure of time and material. And in the majority of cases there will be a direct or indirect advantage to the person entitled to the credit for the saving.

A voluntary, universal response to the call for saving coal

in the many small ways that present themselves every day will insure the success of the great efforts at fuel retrenchment which are now being made in the industries and by central plants.

MASSACHUSETTS BOARD ON WATER POWER CONSERVATION

State Commission Seeks Authority from Legislature to Investigate Questions Involved in Water-Power Conservation and Development

Authority to investigate the possibilities of conserving stream flow in conjunction with the Commission on Waterways and Public Lands is sought by the Massachusetts Gas and Electric Light Commission in its recommendations to the incoming Legislature. The board says:

Two of the companies under the board's supervision [the New England Power Company and Turners Falls Power & Electric Company] transmit and deliver to the industries of the Commonwealth power generated by hydroelectric developments on the Connecticut and Deerfield Rivers. The power so furnished during the present year would have required more than 450,000 tons of coal to produce.

It appeared at the hearings relative to the issue of securities that a projected stream flow conservation undertaking on the Deerfield River would increase the hydroelectric energy developed by that stream to an equivalent of over 150,000 more tons of coal. It also appeared that if the spring freshets were impounded near the principal sources of the Connecticut River and the flow of the stream equalized throughout the year, the output of the three developments on the main stream which are furnishing power to the Commonwealth might be increased over 15 per cent and more than 58,000 tons of coal saved. A similar undertaking on the Millers River would add to such saving over 8400 tons.

Steps have already been taken by the two companies mentioned to investigate the feasibility of storage basins upon certain of the tributaries of the Connecticut River in New Hampshire and Vermont. But any treatment of the full development of rivers as sources of power requires the exercise of governmental powers, and in the case of the Connecticut co-operation of the federal government, as well as of the four states which border upon the river or through which it flows. The board therefore recommends that steps be taken to investigate the feasibility and the legal and political questions involved in this project and the possibility of a similar treatment of the smaller streams whose sources are within the Commonwealth.

It is proposed to report upon this subject to the 1919 Legislature.

PATRIOTIC WORK OF THE NATIONAL DEFENSE COUNCIL

Purpose to Make Available the Best Thought and Effort of Industrial and Professional Life to Prosecute the War

A report of the Council of National Defense just made public covers the history of the council from its inception to the close of the fiscal year ended June 30, 1917. Permanent organization of the council was not effected until March 3, 1917. Director W. S. Gifford says in introduction:

In a broad sense the council and commission have sought to make available to the United States the best thought and effort of American industrial and professional life for the successful prosecution of the war. It has become a truism that no past war has been so essentially a war of the mechanic and the machine, and it is the realization of this truth that has been throughout the inspiration of the policy

pursued by the council, the commission and their subordinate bodies.

The direction of the machinery of American industry for the national defense necessarily involves the creation of an organization of great flexibility. The swift changes in strategy and rapid improvement in war machinery, attended by the equal speed with which implements of warfare are scrapped and replaced at the front, has been reflected by corresponding rapid transformation and stimulation of the industrial organization within the nations at war. These ever-changing developments have necessitated almost unprecedented flexibility in government organizations.

The history of the first three months of the war in the United States has proved no exception. Constantly recurring demands for increases in personnel and for new efforts in unexpected directions have had to be met as the war progressed. It has been the effort of the organization of the Council of National Defense to hold itself in constant readiness to meet such new demands and to shift its ground and expand its facilities in the interest of the national service. It has been in no sense a fixed institution. Its organization has been and of necessity must continue in process of evolution rapid enough to keep abreast with the rapidly changing current of the times and yet conservative enough to prevent confusion or lack of proper co-ordination and control. In a peculiar sense it has felt itself called upon to be constantly ready to "fill in the gaps" and assist the regular departments of the government in their splendid and successful effort to expand and carry the new and huge burdens thrust upon them by the country's need. Flexibility must remain the essence of the spirit with which the council carries on its work.

The National Research Council has served as a department of science and research of the Council of National Defense and in that capacity has been charged with the organization of scientific investigation bearing on the national defense and on industries affected by the war. It has co-operated extensively with foreign scientific missions to this country from the Allies, and has been represented abroad in joint work for the promotion of research service of particular value to the conduct of the war, including the submarine problem and various physical and chemical problems.

It has been the function of the committee on engineering and education to make available to the government in the most effective possible form the services of the engineering and educational professions.

The engineering committee has been appointed by different engineering groups to assist in the solution of problems of engineering policies. In a similar way,

embarrassing situation wherein the members of the present committees are apparently called upon to act both as government agents or advisers and at the same time as representatives of the industries. In dissolving the present co-operative committees of industry, which were appointed by and under the direction of the council, the action is taken only with the highest praise and thanks for their splendid and indispensable work and at the same time with the hope that representative committees of industry will be formed by the industries themselves at the earliest possible moment. Already a number of such committees have been organized. The establishment of such committees, formed so as to entitle them to speak for their entire industries, will render immediately available valuable sources of information upon which the government can draw in connection with the countless business and industrial problems attendant upon the conduct of the work necessary for the prosecution of the war.

DAYTON ENGINEERS' CLUB TO DEDICATE A NEW HOME

Formal Exercises to Be Held on Feb. 2 to Place Fine Structure at the Service of the Engineering Industries

The new home of the Engineers' Club of Dayton, Ohio, will be dedicated on the afternoon and evening of Feb. 2. It will be a great event in the engineering circles of the entire Miami Valley. The dedicatory exercises are expected to be of decided interest.

At present the club has about 300 members. Col. E. A. Deeds, the president, is chief of the Aircraft Production Board, and is giving his entire time to the war program. The other officers are: First vice-president, C. F. Kettering; second vice-president, Orville Wright; third vice-president, H. M. Waite; recording secretary, H. I. Schenck; treasurer, F. O. Clements; house secretary, W. E. Bingham.

The new building is at the southeast corner of Monument Avenue and Jefferson Street, facing the river.

The pioneering genius has made Dayton unique among American cities. The creative work of Wilbur and Orville Wright has been acknowledged internation-

NEW HOME OF THE ENGINEERS' CLUB OF DAYTON, OHIO

through a meeting of the heads of 187 colleges, universities and technical schools, held in Washington on May 5, the work of carrying on the national relation between the colleges and the nation was turned over to the education section. Detailed references are made to the work of the members of the various other committees.

Recently it has become feasible to discontinue the

ally, and Dayton, the birthplace of aviation, to-day has a magnificent airplane factory, one experimental flying field devoted to research and development work, the McCook experimental field of the aircraft engineering department of the United States Signal Corps, and the Wilbur Wright Field, the largest aviation training school in the world.

Associations and Societies

A complete Directory of Electrical Associations is printed in the first issue of each month on the next-to-last text page.

New York Chapter, A. A. E.—Edmund F. Perkins, consulting engineer, Chicago, president of the American Association of Engineers, will address the New York chapter at the Hotel McAlpin on Tuesday, Jan. 15, at 8 p.m., on the subject "National Association Service for Engineers."

Schenectady Section, A. I. E. E.—John L. Harper, chief engineer Hydraulic Power Company and Cliff Electric Distributing Company of Niagara Falls, N. Y., addressed a meeting of the Schenectady Section of the A. I. E. E. on the subject of "Niagara Power or a Real Coal Shortage?" This meeting was held Jan. 4.

Minneapolis Section, A. I. E. E.—R. F. Pack, general manager of Northern States Power Company and the Minneapolis General Electric Company, was one of the speakers at the meeting of the American Institute of Electrical Engineers at Minneapolis Jan. 11. His subject was "Public Service Corporations and What They Have Done in the War."

New York Section, I. E. S.—On Jan. 10 this section held a meeting in the Engineering Societies Building to discuss the code of lighting school buildings. L. B. Marks, chairman lighting legislation committee, presented the code in abstract, and C. B. Snyder, superintendent of school buildings, Department of Education, city of New York, discussed the practical application of the code.

Vancouver Section, A. I. E. E.—The following officers were elected for the coming year by the Vancouver (B. C.) Section, A. I. E. E.: Chairman, R. F. Hayward; secretary, T. H. Crosby; executive committee, E. P. La Belle, C. N. Beebe and L. B. Philpot. At a recent meeting of this section M. L. G. Robinson presented a paper on "The Present Trend and Development of Electrical Business, with Possibilities for the Future."

Brooklyn Company Section, N. E. L. A.—The December meeting of the Brooklyn Company section of the N. E. L. A. was held in the Y. M. C. A. auditorium on Tuesday evening, Dec. 18, with the largest attendance for the year. Almet F. Jenks, presiding justice of the Appellate Division of the New York State Supreme Court, delivered an address on the world war, contrasting every-day life in Germany with our own. The competition paper entitled "Economy in Ordering Printed Forms," presented by A. O. Kohloff of the purchasing department, pointed out many important features in connection with this subject and was discussed by a number of the members present. Motion pictures and other entertainment were provided.

New York Section, A. S. M. E.—Walter Rautenstrauch addressed the New York Section of the American Society of Mechanical Engineers Jan. 8 on the subject "Relation of Manufacturing to Banking and Research."

Jovian League of New York.—Former Senator Theodore E. Burton addressed the members of the Jovian League of New York on Jan. 9. The following officers and directors were elected for the year 1918: President, James M. Wakeman, Society for Electrical Development; vice-president, George Williams, Henry L. Doherty & Company; vice-president, H. A. Pratt, Westinghouse Electric & Manufacturing Company; secretary, F. M. Feiker, editorial director ELECTRICAL WORLD and *Electrical Merchandising*; treasurer, L. L. Strauss; directors, Arthur Williams, New York Edison Company, and James R. Strong, Tucker Electric Construction Company.

Cleveland Electrical League.—E. J. Laibman of Zhitomir, Russia, spoke before the league on Jan. 3. Whether a separate peace is concluded or not, he declared that from a military standpoint Russia is out of the war for good. A new offensive would be impossible, he said, because the nation is too demoralized to become again a potent military factor. The peasants, he continued, want peace and an education. They may be in sympathy with the Bolsheviks, because the Bolsheviks are promising them things. The peasants do not realize the position in which the country is at the present time. Mr. Laibman was exiled to Siberia by the imperial government for revolutionary activities.

Ohio Electric Light Association at Dayton.—The program for the meeting of the new-business co-operations committee of the Ohio Electric Light Association, to be held Jan. 16 at Dayton, has been arranged as follows: Address of welcome, Judge E. P. Matthews, vice-president Dayton Power & Light Company; "Low-Temperature Industrial Heating," Dwight D. Miller, Society for Electrical Development, with discussion by H. J. Kuhns of Toledo, C. W. Bartlett of Schenectady, N. Y., and Wirth S. Scott of East Pittsburgh, Pa.; luncheon address by George C. Smith of Baltimore, Md., on "Industrial Surveys for Intensified Service; afternoon session—"The Uses of Electricity for the Manufacture of Chemicals," by C. A. Winder of Niagara Falls, with discussion by C. D. Carlson of Cleveland and J. C. Matthieu of Dayton; "Water Pumping by Electricity," by R. L. Yates of Dayton, with discussion by C. I. Crippen of Youngstown, F. H. Hooper of Van Wert, Ohio, and Frank B. Steele of Dayton. At the banquet Judge Roland W. Baggott, Dayton, will be toastmaster. The speakers will be J. W. Lieb of New York on "The Electrical Industry and the War"; J. M. Switzer of Dayton on "The City and the Public Utilities"; D. L. Gaskill of Greenville, C. F. Kettering of Dayton, E. R. Kelsey of Toledo, Le Warren James of Dayton and R. H. Grant of Dayton.

Current News and Notes

Timely items on electrical happenings throughout the world, together with brief notes of general interest.

Chicago Sued for Electricity Bill of \$1,900,000.—The Sanitary District of Chicago has filed a suit in the municipal court to collect \$1,900,000 from the city of Chicago. The suit includes amounts for electrical construction and for electrical energy for lighting streets and the city hall. The largest item was \$1,607,486, principal and interest on construction.

Announcing Change to New Location.—The Worcester (Mass.) Electric Light Company moved recently into a new office at 11 Foster Street, Worcester. In addition to the usual announcements in the press the company is adding a sticker to about 35,000 bills mailed for the current month's service. These stickers are also available for use on packages of lamps, appliances, etc., sold from the new office.

Navy Radio to the Philippines.—Secretary of the Navy Daniels has been surprised by the receipt from Admiral Knight, commanding the Asiatic fleet, of a radio message which announced the successful completion of the chain of high power stations whose construction was authorized by the act of Aug. 22, 1912. The stations comprising this chain are Arlington, Darien, San Diego, Pearl Harbor and Cavite. The Darien station was completed about two years ago, San Diego in March of this year, and Pearl Harbor in October; and while it was known that the acceptance test of the Cavite station was under way, the Secretary was quite unprepared for a message of greeting from Admiral Knight.

French Committee Formed to Cooperate with American Electric Committee for France.—There has been formed in America, on the initiative of Capt. Gustave P. Capart of the general staff of General Pétain, a committee of which Dr. C. O. Mailloux is chairman and which has for its objects, first, to render immediate and effective assistance to the French armies and the national defense of France, and, in addition, to promote in times of peace the relations between French and American industry. As the board of management of the Union des Syndicats de l'Electricité deemed it desirable that there should be in France a corresponding committee, it decided to constitute in the body of the union a special Franco-American committee. The president of the union, G. Cordier, requested F. Meyer, managing director of the Continental Edison Company, to take the chairmanship of this new committee. In accepting this position Mr. Meyer received full power to enlarge the committee by adding to it all persons whose assistance he might deem desirable.

E. B. Craft has been appointed an assistant engineer of the Western Electric Company.

W. F. Hendry has been appointed an assistant engineer of the Western Electric Company.

E. H. Colpitts has been appointed an assistant engineer of the Western Electric Company.

J. F. Olney succeeds H. P. Harley as manager of the Ozark (Ark.) Citizens' Service Light & Power plant.

H. P. Harley, who has been manager of the Ozark (Ark.) Citizens' Service Light & Power plant, has been promoted to be manager of the district, which includes several towns.

Philip I. Robinson, superintendent of the Houghton (Mich.) County Electric Light Company, has been transferred by the Stone & Webster Management Association to the Fort Madison (Iowa) Electric Company.

W. R. Emerson, auditor of the Oklahoma Gas & Electric Company, has been selected as one of six accountants from the United States who will perfect a new system of accounting for the American Red Cross.

Earle L. Milliken has been transferred by the Stone & Webster Management Association from being manager of the Cape Breton Electric Company, Ltd., Sydney, N. S., to be general manager of the Houghton (Mich.) County Electric Light Company.

Monroe J. Frankel, chief of the office of gas and electricity, Louisville, Ky., has resigned. Previously he was in the engineering departments of Fairbanks, Morse & Company at Detroit, Mich., and Indianapolis, Ind. Mr. Frankel is a graduate of the University of Kentucky.

W. R. Thompson, formerly manager of engineering and construction for H. M. Byllesby & Company, has been promoted from captain of the 109th Regiment of Engineers, stationed at Camp Cody, Deming, N. M., to major in the same regiment. Mr. Thompson is a graduate of Pennsylvania State College with the class of 1897. For several years he was engaged in electrical engineering work with J. G. White & Company of New York and later in the engineering department of the company's London branch. He became connected with the British Westinghouse Electric & Manufacturing Company in 1903, where he gave considerable attention to problems of power-house design and heavy steam-railroad electrification. He again entered the employ of J. G. White & Company in the United States in 1906 and two years later became assistant electrical engineer for the Public Service Commission of the First District of New York, subsequently becoming acting electrical engineer. He resigned from this position to become assistant chief engineer for H. M. Byllesby & Company of Chicago, and on Jan. 1, 1913, he became manager of the engineering and construction department of this company, in which work he continued until he entered the army.

Men of the Industry

Changes in Personnel
and Position—
Biographical Notes

John G. Galloway, a San Francisco consulting engineer, has been appointed a major in the United States Engineer Corps and has been called into service. Mr. Galloway was consulting engineer for the building of what is believed to be the longest single span of wire in the world, the Carquinez crossing of power lines for the Pacific Gas & Electric Company, near Benicia, Cal.

C. H. Andrews, assistant to president and chief engineer of the North Carolina Public Service Company, Greensboro, N. C., has been appointed general superintendent of the Southern Utilities Company, which corporation operates electric, gas and ice properties

C. H. ANDREWS

throughout Florida, under the management of the J. G. White Management Corporation, New York. He will assume his new duties on Jan. 1. Mr. Andrews was graduated from Purdue University, Lafayette, Ind., in 1908, receiving the degree of B. of S. in E. E. After graduation he entered the employ of the Public Service Corporation of New Jersey, serving in the meter department of that company. In 1909 he became connected with the North Carolina Public Service Company. Soon after joining this organization he was appointed superintendent of the light and power department; later on he was made departmental manager of new business; in 1911 he was promoted to the position of assistant general manager, in charge of electric, gas and street railway utilities in Greensboro and High Point, N. C., and in 1917 his position became that of assistant to the president and chief engineer. In connection with his general duties, Mr. Andrews has devoted much time with success to studying the question of rates and their application.

Alan Sullivan, secretary of the Canadian Electrical Association, has joined the Royal Flying Corps as an equipment officer.

Prof. O. J. Ferguson, head of the electrical engineering department of the University of Nebraska since 1912, has been made acting dean of the engineering college of that university because of the entrance of Dean O. V. P. Stout into active military service. Professor Ferguson is a graduate of the University of Nebraska, class of 1903, and took his master's degree in electrical engineering in 1909 at Union University, where he was professor of electrical engineering from 1905 to 1912.

L. G. Van Ness, vice-president of the Memphis Gas & Electric Company, has resigned to engage in consulting engineering work in Memphis. After being graduated from the course in electrical engineering at the University of Wisconsin in 1896, Mr. Van Ness was for three years variously engaged in machine-shop, pole-line, wiring, engine, meter and testing work in central stations. In 1899 he associated himself with the Emerson-McMillan company and occupied himself in designing and redesigning many of the electric plants under the control of the company. Conspicuous among the plants on which he worked were those of Columbus, Ohio; Madison, Wis.; San Antonio, Tex.; Montgomery, Ala.; Denver, Col.; St. Paul, Minn.; Lincoln, Neb., and a hydraulic generating and distributing system for Quebec. From purely engineering work he went into the study of cost-rate making and accounting for both electric and gas plants. For two years after this he was associated with the Laclede Gas Light Company of St. Louis and the Union Electric Light & Power Company of the same city. His work there covered a period of two years and included chiefly the revision of the accounting systems. In 1906 Mr. Van Ness went to Memphis, Tenn., to build an electric plant and system for the Merchants' Power Company of that city. He became vice-president and general manager of the company, which position he retained until the rate readjustment and consolidation of Memphis utilities some months ago, when he became vice-president of the new company. From this position he has now resigned, as stated.

Obituary

William Maher, Flushing, L. I., connected with the Long Island Railroad Company at Long Island City in the capacity of stationary engineer for forty years, died Dec. 19.

Henry A. Herrick, who built the Black Eagle dam at Great Falls in 1890, died suddenly at Butte, Mont., Dec. 14, at the age of sixty-one. Mr. Herrick had been identified with the engineering features of practically all dams built along the Missouri River by the Montana Power Company or its predecessors in the last twenty-seven years.

Recent Court Decisions

Findings of higher courts in legal cases involving electric light, power and other public utility companies.

Discrimination in Rates.—A city ordinance providing that "water meters will be used wherever and whenever in the judgment of the board they should be attached," in the absence of any charge that the meter rate is unreasonable, will not be held unreasonable as discrimination because meter rates are charged against certain consumers and flat rates against other consumers of the same class, nor because small consumers are charged by the room and large consumers according to the quantity of water used, the Supreme Court of North Carolina held (94 S. E. 3).

Injury from Live Guy Wire.—In an action for injuries to one coming in contact with a live guy wire on an electric light pole evidence was held by the Missouri Court of Appeals, in *Faris vs. Lawrence County Water, Light & Cold Storage Company* (198 S. W. 449), to make plaintiff's contributory negligence in getting close to the pole out of curiosity, on account of the pole being afire, a question for the jury. Persons have a right to travel on streets even to satisfy curiosity, and unless it appears positively that they voluntarily and knowingly come in contact with a live wire or other dangerous agency, or have such knowledge as would suggest caution to an ordinarily prudent person, they are not guilty of contributory negligence. An electric company was prima facie negligent in allowing a dangerous current to escape to a guy wire which had no current breaker or insulator.

Liability for Injuries Received After Assurance of Safety by Foreman.—Where a telephone lineman engaged in painting poles was ordered by his foreman to paint a certain pole, at the top of which were electric power wires, under the foreman's assurance that they were "always dead until after 4 o'clock," the finding that the order given by the foreman was within the scope of his authority as superintendent, and that it was negligent, was warranted, it appearing that the wires carried a potential of 2300 volts, whereby plaintiff received a shock causing him to fall and break his leg, it was held by the Supreme Judicial Court of Massachusetts (117 N. E. 620). A notice of injury under the employers' liability law, stating that the injuries were caused by defective insulation and improper covering of wires on a telephone pole, such wires being charged at a time with an electric current which caused the employee to receive a shock whereby he fell and sustained injuries, was sufficient, without specifying the negligent order of the superintendent in pursuance of which the lineman as-

cended the pole. A notice of injury under the employers' liability law, alleging defective insulation and improper covering of wires, whereby a lineman fell from a telephone pole which he had climbed in pursuance to orders from his superintendent, was held not to be misleading as to the cause of injury.

Safety Precautions Where Wires May Come in Contact.—Where electric street railroad wires, electric light wires, telephone wires and telegraph wires cross each other those maintaining them are bound to use the highest degree of care, commensurate with the danger occasioned thereby, by the use of such appliances, devices and precautions as are practicable to prevent contact of the wires in the event that any of them should break and fall, the Supreme Court of Kansas held in *Lewis vs. Harvey* (168 P. 856).

Provisional Valuation Orders of Public Service Commission.—Provisional orders of the Public Service Commission valuing the property of and fixing rates to be charged by a public service corporation for experimental purposes, and retaining the case on its docket for future action after the result of such experiment is ascertained, are not final orders, subject to the control of the court under the Public Service Commission act, it was held by the Supreme Court of Appeals of West Virginia (94 S. E. 121). The valuation of the property of a public service corporation and prescribing rates for tolls and charges for services to be rendered are purely legislative acts, not subject to judicial review except in so far only as may be necessary to determine whether such rates are void on constitutional or other grounds.

Municipal Plant Discrimination.—Municipal corporations in operating a water plant exercise business and administrative functions rather than those strictly governmental in their nature, and in the exercise of such functions are governed largely by the rules applicable to individuals or private corporations engaged in the same business, the Supreme Court of Oklahoma held (168 P. 800). Municipal corporations operating water plants are not required to give absolute equality of service or rates, but are only required not to act arbitrarily in exercising the discretion vested in them in such matters and not to maintain a discrimination between patrons which is essentially unjust. The law against unjust discriminations rests on public policy, and it is not in violation of the public policy of the State, in the absence of specific legislation on the subject, to permit discriminations by a municipality in favor of a state institution which redounds to the intellectual, moral and commercial benefit of the general public resident in such municipality. Under the facts alleged in the instant case, it was held that the donation of water by the city of Edmond to the Central State Normal School does not constitute an unjust discrimination against a citizen, taxpayer and water consumer of the city who is required to pay a fixed rate for water used by him.

Commission Rulings

Important decisions of various state bodies involving or affecting electric light and power utilities.

Salaries of Utility Officials.—A decision of the New York Public Service Commission, Second District, affecting the Ithaca Traction Corporation, refers thus to salaries: "In the attack which the representatives of the city have made upon the alleged extravagance of the company's operation, considerable stress has been laid upon the number and amounts of the salaries paid, the claim being that the company's salary list is unwarrantably burdensome and that a reasonable allowance for this purpose might materially affect the commission's opinion upon the question before it in the present case. We do not agree with this view. The salaries paid are not in our opinion too high." Higher fares were granted.

Quality of Service.—The Wisconsin Railroad Commission, in a decision affecting the Pulaski Light & Power Company, holds that the electric service furnished by respondent is inadequate; that the equipment is now generally sufficient, but that certain alterations and improvements are necessary; that, as regards night service, it is the standard practice to make such service available at one-half hour after sunset on clear days; that respondent should obtain one of the various tabulations worked out on substantially such basis and govern its operations accordingly; that on cloudy days conditions vary and the time of commencing service must depend upon good judgment; that in case of reasonable doubt, however, as to the necessity for lights at such times the energy should be made available, and that the alterations and improvements specified are necessary for reasonably safe and adequate service.

Development of California Properties.—The Southern Sierras Power Company and the Corona Gas & Electric Light Company have filed with the California Railroad Commission a joint application for authority for the Corona company to lend to the Southern Sierras company for six months \$33,000 from its treasury on a promissory note at 6 per cent. Both companies are practically owned by the same interests, the Southern Sierras corporation operating in Inyo, Kern, San Bernardino and Riverside Counties and the Corona in Riverside County only. They have separate offices, but the Sierras concern is planning to buy all the properties of the Corona company and other small associated companies to economize in management. The Southern Sierras company says that since April of this year it has spent or contracted for nearly \$400,000 for enlargements, and will need large further sums to complete important work.

TRADE & MARKET CONDITIONS

News of the Trade for the Manufacturer, Wholesaler and Jobber
of Electrical Equipment and Supplies—
Notes on Industrial Activities and Business Methods

HEATING DEVICE STOCKS CLEANED OUT IN EAST

Extreme Cold Spell, Coupled with Acute Shortage of Coal and Other Fuels, Results in Record Demand for Radiators and Other Appliances

As far as could be learned the stock of radiators and other heating appliances in the East prior to the unexpected arrival of the unprecedented cold weather of last week was as large as it usually is at this time of year under normal conditions. Distributors, jobbers, dealers, hardware and department stores and other retailers of electrical goods in and about New York had made their usual preparations to meet what they supposed would be the customary demand. But when the intense "cold wave" of last week arrived and persisted in hanging on very much longer than any previous record, stock in these lines melted away more rapidly than even the most sanguine believed possible. Coal, oil and every other fuel that could be utilized were exceedingly scarce, and the pressure for electric radiators became acute. Many apartment houses had no coal for three or four days. The market was swept bare and not a heater could be had at any price. Orders for stock on generous lines were wired to the factories and every effort was made to rush express shipments into the city, but without avail. Freight and express were under embargo, and while the goods were in transit none arrived until practical relief came through heavier receipts of fuel expedited by official pressure on the transportation facilities.

As it stands, merchandise of the description on December delivery is now being distributed to the retail houses as rapidly as it reaches the market. During the most acute stage of the cold spell irons, percolators, grills, toasters, pads and every conceivable type of heating appliance that could contribute warmth were not only short but pretty well cleaned out. The situation is far from easy yet, and final relief is not expected by the trade in the East for a couple of weeks at least. The West seemed to be better prepared and conditions were not so strenuous.

EASTERN ELECTRICAL TRADE FEELS FREIGHT CONGESTION

Difficulties Met in Trying to Get Shipment of Motors from Middle Western Concern Expedited

So far as can be learned from leading shippers and receivers of electrical commodities, deliveries have grown worse rather than better. The situation is said to be more acute in the New York territory than at any other point in the country. The congestion of freight and that of unloaded cars causing this condition has reached the stage where drastic action has been found necessary. Secretary McAdoo, Director General of Railroads, has named the week of Jan. 14 to 21 for the unloading of cars which have for months been used by consignees here as warehouses.

As one electrical goods distributor stated, the demurrage of \$10 a day, instead of \$1 or \$2, should have been put into effect months ago. A jobber carrying one of the largest stocks in the country said deliveries are not only a sore spot, but the situation is almost unbearable. Not only is freight affected by the embargoes, but the express companies, which afforded some relief, even at a higher cost, have in some cases embargoed all but direct and incidental government business.

Shipping West to East is the most difficult to accomplish.

A Middle West manufacturer of motors, who has an important market in New York, Philadelphia and contiguous territory, says he has tried in vain for over a week to move a shipment taken from stock in the New York and Philadelphia warehouses and going South. To expedite deliveries this manufacturer has a traffic man in Cleveland, Ohio, and one in Buffalo, N. Y., who follow shipments. When the train starts, not only is its number taken, but also that of the car containing the merchandise and that of the engine. In addition, the engineer's name and personal appearance are noted. This information is wired to the man ahead, who in turn is on watch, and so it is followed to destination. This factory's deliveries are behind two months, mainly owing to this congestion of transportation facilities. As yet government railroad control has made no perceptible improvement.

SITUATION TO BE MET IN STOCK REPLENISHMENT

Generally Felt that Orders for Merchandise Should Be Placed Early—Fears Concerning Non-Essentials Crop Up

With a reported tendency to economize in buying, the various interests engaged in the manufacture and distribution of electrical goods were called upon by the ELECTRICAL WORLD to verify the statement, so far as they were concerned. They were also asked whether there would be any trouble, hesitancy or unusual delay in replenishing the stocks of jobbers and dealers in staples. The firms approached, of unquestioned standing and influence in the trade, were found to hold diverse views. It was generally agreed, however, that orders should be placed early if stocks of merchandise were to be replenished and maintained at standard strength and levels.

No disposition toward a pessimistic outlook was voiced. On the contrary, buying, in some instances exceeding expectations, was generally characterized by more conservatism and discrimination. The volume of trade in electrical staples and specialties was well maintained and both manufacturers and sellers were preparing for a busy season. At the present time the larger jobbers appear to be carrying strong stocks and fortifying them at every possible chance, owing to the uncertainty of deliveries. Smaller concerns are spoken of as already feeling the pinch and are said to have been calling on the others to help them out by "borrowing" to relieve the immediate pressure of order filling for dealers and general stores. It is stated that establishments of this caliber will encounter more or less trouble in the replenishment of stocks. Other lines of business are in the same predicament. For instance, on lighting fixtures, with the finished articles following the fluctuations of the metal market in price, it is believed that not only will the demand show a curtailment, but that it will be difficult to get goods. Manufacturers are finding it by no means easy to obtain material; hence they are taking no speculative chances with buyers, whether jobbers, dealers or contractors.

Wire and cables are short in this market, and when it comes to replenishing stock there is a question of deliveries and dependence upon the manufacturers. Some of them just now are described by the distributing trade particularly as efficient and therefore will be prepared to replenish stocks, while others, working around in circles, are an uncertain quantity when it comes to filling and shipping orders in a given time. The avenues of distribution are also seriously considering the probability of certain lines being designated as non-essentials and are acting accordingly when placing orders.

RULING ON GOODS
FOR USE IN ONTARIO

All Electrical Equipment Must After April 1 Next
Meet with Approval of the Hydro-Electric
Power Commission of That Province

The Hydro-Electric Power Commission of Ontario has, under date of Jan. 1, sent out the following notice regarding the sale of electrical products in the Province of Ontario:

"Pursuant to the Power Commission act and amendments thereto, and the rules and regulations of the Hydro-Electric Power Commission covering the design and construction of electrical machinery, apparatus, appliances, devices, material and equipment for use in the generation, transmission, distribution or use of electric power or energy in the Province of Ontario, in connection with any electrical installation or wiring for electric light, heat or power, where the electric pressure delivered to or from the same exceeds 10 volts, manufacturers of, jobbers, agents and dealers in electrical machinery, apparatus, appliances, devices, material and equipment, and others interested, are hereby notified that the commission orders that on and after three months from date of this notice no such electrical machinery, apparatus, appliances, devices, material or equipment used, or to be used, as above may be used or disposed of in the Province of Ontario unless and until the design and construction of same has been submitted to the Hydro-Electric Power Commission of Ontario and approval of such has formally been obtained."

METAL MARKET SITUATION

Copper Buying Sharply Reduced by Lesser Demand—
Ample Supply—Tin Scarce and Lead Advancing

An ample supply of copper—at the rate of 50,000,000 lb. per month—is now estimated to be guaranteed for industrial or commercial requirements during the first half of 1918. The demand for this purpose, however, has fallen off sharply in the last six or eight months. An authority states that the difficulty of securing funds to finance power and lighting plant extensions and similar enterprises is held responsible for the smaller buying of copper other than for government uses. This undoubtedly had its influence on the price for base wire which governs the quotations on the various trade commodities. Wire or cable is in a weak position and slightly lower. Rubber-covered wire is a shade off in price also. Solid wire can be shipped from stock, but stranded wire is behind from three weeks to three months on delivery, dependent in large measure upon the varying manufacturing efficiency of the respective individual producers.

Lead is again advancing, but tin, with none offering even at the high figure nominally quoted, is still scarce. It is expected that with the official restrictions placed on the export of Straits tin there will be none received here before the beginning of next May.

NEW YORK METAL MARKET PRICES

	Dec. 31	Jan. 7
	£ s d	£ s d
Copper:		
London, standard spot	110 0 0	110 0 0
Prime Lake	Govt. price 23.50	Govt. price 23.50
Electrolytic	Govt. price 23.50	Govt. price 23.50
Casting	Govt. price 23.50	Govt. price 23.50
Wire base	27.00*	27.00*
Lead, trust price	6.25	6.50
Nickel, ingot	50.00	50.00
Sheet zinc, f.o.b. smelter	19.00	19.00
Spelter, spot	7.82½ to 7.92½	7.82½ to 7.92½
Tin, Straits	85.00†	85.00†
Aluminum, 98 to 99 per cent.	34.00 to 36.00	34.00 to 36.00

OLD METALS

Heavy copper and wire	22.00 to 22.50	22.00 to 22.50
Brass, heavy	14.00 to 14.50	14.00 to 14.50
Brass, light	10.00 to 10.50	10.00 to 10.50
Lead, heavy	5.75 to 6.00	6.00 to 6.12½
Zinc, old scrap	5.00 to 5.50	5.00 to 5.50

*Nominal. †None offering.

THE WEEK
IN TRADE

ACTIVITY is the keynote of the manufacturing, distributing and selling branches of the electrical merchandise field. Where shipbuilding and other governmental work is being developed and carried forward on a great scale the buying of heavy or large electrical equipment is notable. In staple lines ordering since the opening of the year is reported as showing no marked curtailment; when it has occurred conservatism in buying is responsible for the reduction. Conduit pipe and line material are stated to be in a precarious position for lack of deliveries. The sale of farm lighting sets, storage batteries, fans, lamps, etc., is developing optimistically.

No specific complaints are heard regarding collections. Not a few reports say they are unusually prompt, while others declare they are fair. Credit restrictions continue to engage the attention of all sections of the trade.

NEW YORK

Notwithstanding the difficulty of securing sufficient labor—skilled and unskilled—manufacturing activities are not appreciably reduced, if they do not continue unabated. With the business outlook rather obscure and likely to continue uncertain in some lines, there is still a disposition on the part of jobbers and dealers to operate with caution. Earnings have been unprecedented. Building operations continue to be quiet. Government requirements remain the dominating influence. The freight congestion is in a particularly serious situation, although the government's action in reducing passenger traffic will undoubtedly have a beneficial effect.

Collections are variously spoken of as slow, fair and prompt, depending greatly upon the vigorous methods of the creditors. Credits are drawn more closely than ever.

RADIATORS.—An acute shortage of radiators and all heating appliances, amounting to practically a bare market, during the recent cold weather of last week was a cause of embarrassment to distributors, jobbers, dealers and the department stores in this district.

LIGHTING FIXTURES.—Stock goods are moving slowly, as has been noted from time to time, on account of flat building conditions. Fixtures made to order are, if possible, in a weaker position, as their sale is limited to special purposes, with an outlook for even a smaller demand, as reported by leaders in the line.

LINE MATERIAL.—Conditions are being very much affected by the scarcity of material. Shipments held up by embargoes east of Pittsburgh are a cause of anxiety on the part of distributors. An order for locust pins placed early in June last has not been delivered yet. An acute shortage is in sight. Yellow-pine cross-arms are also in bad shape. Of three cars ordered six months ago one was received here; the others are "somewhere" in the South in transit. Fir arms are hard to get, as the lumber is being requisitioned by the government for aeroplanes and ships.

COLLECTIONS AND CREDITS.—Generally speaking collections, when energetically looked after, are returning good results. Over-trading is evident and steps are under way to check it. The day of free credit accommodation is gradually passing away hereabouts. Leading jobbing houses are not reducing their efforts toward a more general introduction of trade acceptances in place of open book accounts. Dealers in this section are inclined to regard the innovation askance, but a brief and clear explanation of their financial and credit advantages dissipates this prejudice. An amended or new form of trade acceptance as adopted by the Federal Reserve banks, which supersedes all other forms used heretofore in the trade, is announced.

LAMP CORD.—A scarcity is reported on silk-covered lamp cord. Prices are at the apex, in the view of the jobbing houses, and no further advances are anticipated.

DRY BATTERIES.—Labor conditions and poor deliveries are interfering with the free movement of dry batteries. Stocks are none too strong.

PORCELAIN.—Goods in this line, with the strikes at the factories adjusted, are in better supply and the situation is greatly improved, but yet not up to normal.

LAMPS.—The position of lamps, with the exception of a few types, is much better than formerly. Orders under the new price schedule, effective Jan. 1, are being booked on a larger scale than before. Jobbers are making their assortments broader and along lines more representative for current demands.

BELLS AND GONGS.—The United States Shipping Board Emergency Fleet Corporation is requesting bids this week for 300 lots of call-bell materials. In all, about 3000 2½-in. vibrating bells for use on 10 volts are called for and also 900 6-in. and 300 8-in. vibrating gongs.

CHICAGO

Nothing but optimism over the outlook for 1918 is expressed by the commercial branches of the industry in the Middle West. The last week has been quiet, some companies being still engaged in taking stock and holding sales conferences. At these conferences manufacturers have held out the opinion that, while trade may slow up in certain branches of the industry, it will go ahead at increasing speed in others. The industrial outlook continues bright.

Several inquiries indicating a good volume of business have been received from railroads in the last week. There is some question in the minds of jobbers, however, as to whether or not the government's taking over the railroads will have any effect upon the buying of railroad maintenance supplies. As yet there is no information at hand which would indicate that a change will be made.

Inventories are developing that some jobbers are carrying stocks which are actually considerably larger in volume than those carried in the end of 1916. The statement with regard to this condition is that the railroad situation makes this necessary in order for the jobbers to deliver the goods. Many big shipments are going out of jobbers' stocks these days by express.

WIRE.—Manufacturers have brought their prices down to a 30-cent base. Certain jobbers within the next week will reduce their prices on rubber-covered wire and weather-proof wire to a 30-cent base. Lamp cord is already on the 30-cent base.

MINE SUPPLIES.—Trolley hangers, signaling systems and the like are being bought quite freely by mines in the Northwest. Traveling salesmen in from that territory report unusually successful seasons among the mining companies, but decreasing business from central stations.

CONDUITS.—The government is still taking such large quantities of conduit that some Chicago jobbers have not been able to replenish stock.

FARM LIGHTING SETS.—The salesmen engaged in selling farm lighting plants report that the soft condition of corn throughout the corn belt is responsible for the loss of much of their farm-lighting plant business. While the farmers are prosperous, they are not as prosperous as they expected to be on account of the fact that the elevators cannot store the soft corn, and the farmers hence cannot get their money out of it until it either dries out or is sold in the local community for feeding stock.

AUTOMOBILE SUPPLIES.—While the automobile outlook may be curtailed in the coming year, the accessory and repair market looks especially bright, since it will be necessary for present car owners to use their old cars, which otherwise they might have discarded for new ones. Using old cars means buying more repair equipment. A good season is therefore expected in this branch of the trade.

PORTABLES.—Floor lamps and silk shades were reduced in price from 25 to 33 1/3 per cent immediately following Christmas in an attempt to clear out stock that had been on the floor for some time. The sales were quite successful.

BOSTON

Business continues in fair volume, though a slight falling off is reported during the period of analyzing last year's conditions and results. Inquiries are coming in and recent price advances in fans and lamps seem to be no deterrent to prospective purchasers. The lamp situation is greatly improved and jobbers are well stocked. The coming of longer days will soon be a real factor in easing the lamp situation still further, combined with the federal "lightless night" program. Jobbers report improved deliveries along many lines; manufacturing facilities are being rapidly brought up to meet present demands and the local stocks of motors are better than for some time. Fan price advances have not yet been passed along to the retail trade and resale contracts are yet to be received by jobbers.

Government demands are very active. One Boston jobber has sold a lamp order to Halifax as a result of the explosion in December. Central stations are pursuing a very conservative policy regarding appliance purchases. Pole-line material is now available at Boston in substantial quantities. Labor conditions are unusually free from disturbance, all danger of a telephone strike having passed. Textile mills are very active. As yet the expected new business from the railroads under government control fails to appear, but it is bound to be a factor in this year's sales. Collections are still a little slow, except where closely followed.

APPLIANCES.—Jobbers are still conservative as to the 1918 outlook, but optimistic reports are in hand respecting the prospects of labor-saving devices, especially irons and washing machines. Industrial heating appliances are in considerable demand. One jobber sold 700 washing machines in 1916, his first year handling these.

LAMPS.—Stocks are much larger and more varied. A 10 per cent advance took place Jan. 1, but this is likely to cause little falling off in the volume of trade. The prospect is for a further accumulation of stocks despite heavy government orders. Jobbers are not yet being supplied on a maximum scale, but one house which recently became agent for a large manufacturer received a heavy initial stock in excess of the normal business allowed under present conditions.

POLE-LINE MATERIAL.—A large jobber specializing in this line reports his stock in ample volume, prices remaining steady and industrial business good. The central-station outlook is for a quiet spring on new construction, but some interconnection of lines and plants should result from the recommendation of the Massachusetts Gas and Electric Light Commission to the Legislature for greater inter-system efficiency.

INDUSTRIAL ELECTRIC TRUCKS.—Inquiries are very active, with considerable government business and keen competition. A delivery of ten days in a drop-frame type of truck was offered the Navy Department last week. Manufacturers are developing this field intensively and the outlook is excellent for the new year.

ATLANTA

Business in general is considerably off this week as compared with the pre-holiday period. New Year's Day falling on Tuesday, thus breaking into the week, combined with a post-inventory lethargy, has tended to slow up orders. But representatives of the various manufacturers and jobbers at this point have begun to cover their territories and business is expected to be equal to, if not greater than, what it was in the last few months of 1917.

The shipbuilding program seems to hold the center of the business activity at this time. The Tennessee Coal & Iron Company's new shipyards near Mobile, Ala., incorporated by the Chickasaw Shipbuilding Company, is one of many instances of the activity in this industry. Speculation is rife regarding Henry Ford's trip South this week in the interest of the government and the location of his large steel shipbuilding plant. With the freight situation growing worse each day at the Eastern ports, it is expected that the facilities of the Southeastern ports will receive more consideration in the shipbuilding program.

Motor manufacturers have received specifications this week covering the electrification of the Saxon Mills and Spartan Mills Nos. 1 and 2, Spartanburg, S. C. Bids on the former mill are to cover 1500 hp. individual and group drive, and those on the latter 4000 hp. group drive. J. E. Serrine & Company, Greenville, S. C., are the engineers. Power will be supplied by the Blue Ridge Power Company, Spartanburg.

The Unity Cotton Mills, Lagrange, Ga., contemplate the purchase of 400 hp. individual motor drive, securing energy from the Columbus Power Company, Columbus, Ga. Specifications covering wiring and motor installation of approximately 4000 hp. for the Langley Mills, Langley, S. C., have been sent out by C. R. Makepeace, engineer, Providence, R. I.

Steam turbine sales for this section were given quite a boost recently by the Emergency Fleet Corporation's purchases to the extent of \$1,000,000, covering equipment for ship propulsion.

A few manufacturers and jobbers report a slowing up in collections from municipalities. The theory is advanced that this condition is due to the fact that these municipalities are diverting a large amount of current funds toward abnormal fuel costs. The continued cold spell has tended to increase further the difficulties of the various public utilities depending on coal for fuel.

MOTORS.—The demand for the standard three-phase type has slackened. This is, no doubt, due to a number of causes, such as priority investments, scarcity of fuel, lack of available water power and increasing length of shipment. A number of substantial orders have been placed recently and some big business is in sight, but it is not expected that the pressure on this line will be so great for some time as it was during June, July and August, 1917. There is practically nothing available in local stocks. Prices firm.

FLOODLIGHTING.—Shipbuilding plant and yard construction, together with munition plants and other industries working on war materials, has stimulated the demand for all types of light projection in the Southeast, with good prospects for continued activity in this line. Lamps rated at 200, 400 and 1000 watts are in great demand, the 400-watt size being the most popular.

FANS.—Jobbers and dealers are placing more substantial orders for fans at this time than they did last year, as they are afraid that fans may be put on the luxury or non-essential list later on.

SEATTLE

Staple lines, mainly equipment for ships under construction, are selling about the same as for the past month at peak prices. Wholesalers state that the past year's business was far better than anticipated and are looking forward to still greater activity during 1918. The big increase in retail business last year was due to heavy buying by shipyard workers. This class of buying has increased enormously. Wholesalers state that without a doubt industrial business will hold up and increase in volume during the year in spite of prices considerably higher than last year at this time.

Stocks are not in quite so good shape as last year at this date. Heavy orders are being placed on account of the anticipated difficulty of getting materials to the coast due to railroad congestion, as well as in consideration of the list of non-essentials which dealers expect will be very materially increased within the next few months. The main stock shortages are conduit, particularly black and the $\frac{3}{4}$ -in. size, which is used extensively by the government. The lamp shortage still exists and, if possible, is worse than heretofore reported. The movement of wire in all sizes is about the same, with prices remaining firm. Securing of wire stock is spasmodic, although stocks are in fair shape. Motors are selling satisfactorily in both large and small sizes, with large orders for new mills or shipbuilding plants coming intermittently.

The volume of repair work on small and medium-sized vessels in Puget Sound harbors is gaining steadily and will continue until about March 1. Electrical dealers are realizing a nice business from this source. Owners of repair

yards state that the volume is running far ahead of former records. Motors, wire and lamps are being bought for that purpose.

The transfer of all wooden-ship contracts from the Southern pine district to the West Coast fir territory because of speedy delivery is expected by West Coast lumbermen. The establishment of a central purchasing office for standard commodities used in construction of wooden ships will be suggested to the United States Shipping Board by the Washington wooden-ship builders. Shipbuilders are desirous of having the government take over the assembling and distribution of materials used in construction. The Seattle Metal Trades Council, representing 15,000 shipyard workers, recently voted to request the United States Shipping Board to reopen the shipyard wage scale award made last fall and authorize an upward revision of shipyard wages in the Puget Sound district on the ground that the rise in cost of living since Aug. 1 justifies corresponding increase in wages. During the week plans were announced for the establishment of a steel shipbuilding plant in Portland, a machinery installation plant in Aberdeen, and the first unit of the steel plant in Seattle to be equipped with electric furnace and electric machinery. Building is showing no signs of renewed activity with exception of orders for additional structures at Camp Lewis, the Vancouver barracks and the Puget Sound forts.

Relief of congested conditions of the Puget Sound terminals is expected to result speedily from the appointment of a joint committee of railway and steamship officials to devise a solution of the problem. Federalization of railroad lines will lead, it is believed, to an early settlement of terminal problems and is certain to result in an issuance of an order to abandon intraterminal switching. Transcontinental lines are striving to reorganize service, which was disrupted during the past ten days by floods. Work of repairing and rebuilding washed-out bridges in mountain divisions particularly is being rushed under difficulties. Collections fair.

SAN FRANCISCO

Government orders are probably of first importance in point of volume in the San Francisco field just now, even excluding the requirements of the Shipping Board. Construction is under way at the naval training stations, navy yards, military encampments and fortifications, and electrical materials constitute a considerable part of the orders placed for such work.

The time required for Eastern freight deliveries has jumped from seventeen days, which was the average a month or six weeks ago, to thirty to forty days, which is the time in which shipments are now arriving. However, government control of railroads is confidently expected to improve freight shipments.

The California Railroad Commission has decided that government railroad control will not affect the applications for rate increases which electric railways have filed. This news has strengthened electric railway securities, and, with the freight business these lines are developing, the prospects in this field are much better than they have been.

SMALL MOTORS AND TRANSFORMERS.—There is an outlook for a heavy demand in the agricultural field. Stocks are improving in small sizes. About eight months' time is generally desired for motors of more than 50 hp., and about four months on sizes of more than 15 hp. On emergency calls, however, the leading manufacturers do better.

STORAGE BATTERIES.—The demand for automobile storage batteries continues very heavy, but with improved facilities for assembly in San Francisco this demand is being handled satisfactorily. Battery orders for the United States Shipping Board continue heavy, and in recent months the demand from firms which assemble motor trucks on the Pacific Coast has been steadily increasing. The manufacture of farm tractors also calls for an increasing supply.

FARM LIGHTING SETS.—With agricultural district prosperity the attention to farm lighting sets has been renewed, and one of the leading manufacturers reports having sold more equipment of this sort in the last two months than has been placed in the two years previous.

Current Prices of Electrical Supplies

New York and Chicago Quotations

THE prices quoted are those prevailing in standard packages or specified lots on apparatus and appliances in Eastern and Middle West markets at the beginning of business on Monday of this week. They are in all cases the net prices or prices subject to discounts from standard lists of contractors, central stations, dealers and others engaged in the resale of such goods.

Prices in Southern and other nearby markets will rule about the same as those in the Middle West, although slight modifications to cover increased freight and local demands should be expected. In the Far West and on the Pacific Coast the prevailing prices are naturally higher, covering as they must

increased freight and the necessity of larger stocks with increased interest and warehouse charges on account of the distances from sources of supply, infrequent turnover of stock and uncertainty as to delivery of goods in transit. Moreover, the Far West presents a wide variation in demand due to a small population spread over a wide area in agricultural and mining communities, as contrasted with the denser population of the East and Middle West, their nearness to the source of supply, the more frequent turnover in stocks and the constant demands which arise in industrial centers. Price variations may be due to difference in grade of products of different manufacturers, to local conditions, or to both.

NEW APPARATUS & APPLIANCES

A Record of Latest Developments and Improvements
in Manufacturers' Products Used in
the Electrical Field

Renewable Cartridge Fuse

The Trico Fuse & Manufacturing Company of Milwaukee, Wis., points out seventeen superior features for its renewable cartridge fuses. Several of the claims made follow. To renew or inspect these fuses in the ferrule type end screws and caps are removed, and in the knife-blade type one cap only is removed. The renewals are powder-filled and carry starting or momentary overloads, yet positively protect apparatus from prolonged overload, it is claimed. No blackening or burning of contacts is had, as the powder smothers the arc. The knife blades and terminals are self-aligning, which insures perfect contact with clips, eliminating blow-outs due to terminal heating. In the ferrule type the cap is screwed over the fiber shell to terminals of renewal cartridge, then secured with a heavy brass screw. In the knife-blade type the renewal elements have solid copper terminals securely bolted to blades, making perfect copper-to-copper contact and doing away with oxidized and burned-out renewal elements due to heating or contact bolts.

Motor-Operated Polishing Machine

The Ernst Koppen organization of New York City has developed a motor-operated knife-cleaning and silver-buffing machine. According to the motor supplied, it can be used on circuits of 110 volts or 220 volts, direct current, or on 60 cycles, alternating current of 110 volts or 220 volts.

The complete device consists of a pair of patented cleaning or polishing brush disks and a fractional-horse-power motor made by the General Elec-

KNIFE-CLEANING AND SILVER-BUFFING MACHINE

tric Company, which drives the disks through gears and besides has a buffing-shaft extension for the buffing of light silverware or rinsing of teapots, etc.

The knife cleaning takes place between the brush disks in the inclosed drum on the left of the motor, and the cleaning or polishing brush disks will, it is claimed, serve several hundred thousand knife blades without renewal, which is done at a low cost. The butt of the knife handle is polished by the special attachment at the right end of the back-gear shaft.

Electric Cleaner with Few Parts

The "America" vacuum cleaner, which is just being placed upon the market by the Wise-McClung Manufacturing Company of New Philadelphia, Ohio, is said by the manufacturer to have fewer parts than any other electric cleaner. A number of distinctive features are claimed for this appliance, among them a patented floor brush the design of which permits sewing-room litter, threads, etc., to pass through a center vent direct to the dust bag, thus

EQUIPPED WITH PATENTED FLOOR BRUSH

leaving the brushes always free from accumulation. A positive catch for raising and lowering the nozzle can be adjusted by the tip of the operator's shoe, as can also the patented electric control switch. It is made under the Kenney patent.

Insulating Material

A material which is known as "leatheroid" and comes in sheets of various thicknesses for use in place of fiber is now made by the Leatheroid Manufacturing Company, 43 West Sixteenth Street, New York City. This material is made in different colors, including black, reddish tan and gray. According to tests made by the Electrical Testing Laboratories, New York City, the dielectric strength of this material is about 350 volts per mil thickness. It is now being used by a number of large manufacturing companies as an insulating material.

Alternating-Current Motors

The St. Louis Electrical Works of St. Louis, Mo., have just finished complete development of a full line of alternating-current motors, single-phase motors from $\frac{1}{4}$ hp. to 2 hp. and polyphase motors from $\frac{1}{2}$ hp. to 10 hp.

EQUIPPED WITH CENTRIFUGAL STARTING DEVICE

These motors are for a frequency of 60 cycles and a speed of 1750 r.p.m. A speed of 1200 r.p.m. can be furnished in the two-phase and three-phase motors. Any of the frame sizes can be furnished for frequencies of 50, 40, 30 and 25 cycles.

The frame construction is of the skeleton type and so put together as to give excellent ventilation to both the stator and rotor, and the design has been so worked out that the frames are interchangeable for both the single-phase and the polyphase motors. With the use of this special winding and the proportion of the ratio of the rotor to the stator very low iron losses take place.

Ball bearings have been adopted exclusively for these motors. The oiling arrangement is such that all oil that gets to the bearing has to filter through a felt washer that is used in inclosing this bearing. A ball bearing oversized in comparison to that recommended by ball-bearing manufacturers is used at the pulley end of these motors. The rotor construction is such that it acts as a fan for the stator, and this fanning is done by the rotor bars, which extend out.

In the single-phase motors the split-phase winding is used in starting and on all sizes up to and including $\frac{1}{2}$ hp. A centrifugal starting device is furnished. This centrifugal starting arrangement can also be furnished on larger sizes if specified by the purchaser; otherwise a double-throw starting switch is furnished. This centrifugal starting switch is mounted outside the motor on the end plate and rotor shaft. It is completely inclosed

and gives the motor all the features of a completely inclosed motor, still allowing ventilation at the ends. Inside of the end plates of the single-phase motor there is a simple squirrel-cage rotor. This design gives this single-phase motor all the simple features of the ordinary squirrel-cage, two-phase or three-phase motors.

This starting device is so constructed that in breaking the contact which cuts out the starting winding it does it with a snap. The quick break eliminates chattering or the burning of the contact points by arcing. The points used for making and breaking contact are tungsten, which assures minimum wear. The 5-hp., 7½-hp. and 10-hp. motors are furnished with leads brought out so that the motors can be started by the Y-delta starting arrangement if desired. The bringing out of these leads also permits the motor to be connected either for 110 or 220 volts.

Bell-Ringing Transformer

An improved bell-ringing transformer is announced by the Packard Electric Company of Warren, Ohio. The former type made by this company had a brass-bolted two-piece case with lugs projecting from the top and two lower sides, and these have been eliminated by making the heavy porcelain case in one piece. This results in a neater, more compact instrument—the only projecting parts being the bell-wire binding posts and two small slotted flanges on the base to receive the screws by which the instrument is secured in place.

The electrical element is inserted in the case through an opening in the base and then completely covered with a fine grade of sealing compound, thus forming the unit into practically one solid piece. The leads are marked in raised letters on the adjacent porcelain, insuring against any possible mistake in making connections.

The instrument is so made that a dead short circuit on the secondary or bell side for an indefinite length of time will pull less than 15 watts from the 110-volt service wires. The cases are finished in blue with a high glaze which renders the unit attractive to the eye and assists materially in making sales.

Box Connector

Box connectors that are easy to apply and that hold conduit tightly are made by S. R. Fralick & Company, 15 South Clinton Street, Chicago. It is

HOLDS CONDUIT TIGHTLY

claimed that there is no danger of the conduits pulling out when these connectors are used. The accompanying illustration clearly shows how this

connector is applied and how it holds the conduit. The screw, it is said, eliminates the danger of the conduit pulling out.

Magnetic Brakes

The principle of the type of magnet which has been so successfully incorporated in the design of magnetic controllers by the Westinghouse Electric & Manufacturing Company of East Pittsburgh, Pa., has been employed by the company in a new design of magnetic brakes just developed for use with mill, crane and hoist motors. The use of a clapper-type magnet eliminates all moving parts within the coil and the consequent wear, sticking or damage to insulation. The modified and improved type A alternating-current brake with which the trade is already familiar and the new type B direct-current brake are similar in operation and have common parts throughout except for the armature lever and magnet.

These brakes are characterized by the quickness of their operation. They respond almost instantly, "releasing" when the power is applied and "setting"

PARTS OF BRAKE ARE READILY ACCESSIBLE

when the power is cut off. This is due to the design of the operating magnet, which gives high initial pull and a very small distance of travel, ¼ in. to 1 in. (6 cm. to 2.5 cm.).

Their operation is similar. When voltage is impressed on the motor the magnet is energized and the magnet armature lever overcomes the pressure of the compression springs through a toggle and releases the brake-shoe grip upon the brake wheel. While the magnet remains unenergized the brake wheel is allowed to rotate freely. As soon as the current is shut off from the motor the brake magnet releases and the compression springs force the shoes against the brake wheel and bring the motor quickly and smoothly to rest without shock or jar. The compression exerted by the springs can be easily adjusted so that any holding or retarding torque up to the full capacity of the brake can be obtained for equal braking effort for both directions of rotation. Simple means for making adjustment for shoe wear are provided.

In case adjustments for shoe wear should be neglected, a safety feature has been introduced so that the brake does not fail to hold the load but the magnet will not release the grip on the brake wheel. This insures proper brake operation and the elimination of accidents due to the brake wheel slipping.

Outlet-Box Receptacle

The Arrow Electric Company of Hartford, Conn., has just placed on the market an outlet-box receptacle with a removable porcelain ring grooved for shade holder. This shade-holder

EQUIPPED WITH A REMOVABLE GROOVED PORCELAIN RING

groove is the new feature of the device, as the receptacle base is nothing more than the standard short type of sign and outlet-box receptacle which has been on the market for a number of years. The ring is threaded sufficiently to support a considerable weight, and it can be fitted to bases, for ordinary cleat wiring, for weatherproof work and for concealed terminals.

Adjustable Light Fixtures

Fixtures that consist of a ball-and-socket arrangement to be secured to the ceiling and a steel rod provided with brass sliding or extension tube which can be drawn out or pushed back over the rod at will are made by the Peter Forg Manufacturing Company of Somerville, Mass. It is pointed out that the ball-and-socket arrangement permits the fixture to be at once adjusted to any desired position. The lower end of the sliding tube is provided with a ball-and-socket clamp, to which the lamp can be readily attached and which permits the lamp to be turned to any desired angle. On this fixture the upper part of the wire is coiled around the rod, and as the lamp is drawn down the coil is extended, the cup at the bottom of the coil pushing the wire back to a close coil as the lamp is raised.

Motor-Operated Vegetable Washer

The American Machinery Company of Philadelphia has developed motor-operating machines for simultaneously paring and washing all hard-root vegetables. These machines are extensively used by the United States government in the navy and all governmental institutions. They remove the outer skin of the vegetables and turn them out ready for cooking.

The machines are made in a variety of sizes suitable for use in restaurants, hotels, hospitals and institutions of various kinds. Power for the machine is obtained from fractional-horsepower motors manufactured by the General Electric Company. The motors are inclosed and are moisture and dust proof, furnished either in direct current or alternating current to meet the service conditions. These motors are regular equipment for these machines.

Trade Notes

HESS & SON, Philadelphia, owing to need of increased manufacturing facilities, have removed from 1031-1033 Chestnut Street to 1302-1304 Filbert Street.

C. P. COLEMAN was elected president of the Worthington Pump & Machinery Company of New York City at a meeting of the board of directors on Dec. 31, 1917.

JOHN N. TIMBERLAKE resigned as power apparatus sales engineer of the Northern Electric Company on his appointment as Montreal (Canada) district sales manager of R. E. T. Fringle, Ltd.

THE MENOMINEE ELECTRIC MANUFACTURING COMPANY, Menominee, Mich., has moved its office and stockroom from 30 Church Street to 150-152 Chambers Street. The change was made Jan. 1.

THE WESTERN ELECTRIC COMPANY of New York City has leased the eight-story building at 152 to 156 West Thirty-sixth Street for a term of years. The building is to be used for a warehouse.

H. H. HONDE, sales manager of the Electric Railway Manufacturers' Supply Company, has resigned to become associated with the North Coast Electric Supply at Seattle, Wash., of which Harry Byrne is manager.

PERCY E. WRIGHT, consulting mechanical engineer of Seattle, Wash., has taken the management of the Jeffery Manufacturing Company of Columbus, Ohio, for the Northwest and opened offices in the L. C. Smith Building, Seattle.

THE NEW YORK CITY BETTER HOMES EXPOSITION will be held in the Grand Central Palace, New York City, from May 18 to 25, inclusive, under the management of Louis W. Buckley. The floor space to be occupied equals 100,000 sq. ft.

L. W. SHIRLEY, formerly general sales manager for the Link Belt Company of Chicago, is now stationed in Seattle, Wash., as secretary and manager of the Washington Corporation of the Link Belt Company, with plant and offices at 574-576 First Avenue South.

C. G. COX has been transferred as district manager of the McIntosh & Seymour Corporation from St. Louis, Mo., to San Francisco, Cal. The St. Louis office is discontinued. Mr. Powelson, who formerly represented the company in San Francisco, is no longer connected with it.

THE WAR TRADE BOARD, Washington, D. C., has issued bulletin No. 1, containing the complete text of the trading-with-the-enemy act, approved by the President Oct. 6, 1917, and also a full list of the enemy trading list, with the index of the names by countries. Notes on the list are also embodied.

D. GLEISEN, manager of the industrial bearings division of the Hyatt Roller Bearing Company, Newark, N. J., is a mechanical engineer, a graduate of Stevens Institute, and has been connected with the Hyatt company for the last six years. He was formerly assistant manager of the company in charge of bushings sales.

THE CREDIT ASSOCIATION OF THE BUILDING TRADES of New York City has distributed a pamphlet entitled "The Present Trouble with the Building Trades." It relates the causes of the present unsatisfactory conditions in that line of business. The remedy suggested is co-operation between all interests concerned.

JAMES MOREY, formerly representing the Multi Refillable Fuse Company of Chicago, recently absorbed by the Chicago Fuse Company, has become connected with Hathaway & Knott, Inc., electrical merchandise, New York City. Mr. Morey, whose appointment became effective Jan. 2, will travel the Southern territory and Pennsylvania.

NIXON & KIMMEL, electrical engineers and contractors of Spokane, Wash., have been appointed distributors for the Edison storage batteries and Edison farm lighting plants for all territory east of the Cascade Mountains in Washington, and all of Idaho and the western part of Montana. They are also distributors of the Robbins & Myers motors, etc., the Sangamo meters and the Maloney transformers. Nixon & Kimmel have been in Spokane for twenty years.

GARNETT, YOUNG & COMPANY, San Francisco, Cal., announce their succession to the business of the Telephone-Electric Equipment Company, which will be conducted without interruption at San Francisco, Los Angeles, Seattle and Portland,

there being no change in the address of the respective offices. The personnel of the management and sales staff is exactly the same as in the old company, while the character and policy of the business holds without modification.

THE TELEPHONE-ELECTRIC EQUIPMENT COMPANY, San Francisco, Cal., is exclusive Pacific Coast sales agent for the following manufacturers: American Electric Works, Chicago Pump Company, Hart & Hegeman Manufacturing Company, Harvey Hubbell, Inc., Holtzer Cabot Electric Company, National Metal Molding Company, H. T. Pulste Company, Pratt Chuck Company, Shuplex Wire & Cable Company and the Stromberg-Carlson Telephone Manufacturing Company.

FRANK J. POLEY, manager of the mining section of the industrial department of the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has taken a position as manager of the mining and traction department of the Edison Storage Battery Company, Orange, N. J. Mr. Poley, who is a graduate of Pratt Institute, Brooklyn, N. Y., has been with the Westinghouse company for twelve years, commencing with the service department in New York City and later being transferred to East Pittsburgh.

FRANK W. HALL has been appointed commercial manager of the Sprague Electric Works of the General Electric Company, New York City. With the exception of a short period Mr. Hall has been connected with the Sprague Works continuously for twenty-two years in various engineering and sales capacities, and for the three years prior to his present appointment occupied the position of sales manager. D. C. Durland, former executive head of the Sprague Electric Works, has resigned to accept the presidency of the Mitchell Motors Company, Inc.

SWISS COMMERCIAL LAWS. — The Swiss commercial laws are analyzed in a new report of the Bureau of Foreign and Domestic Commerce, Washington, D. C., entitled "Commercial Laws of Switzerland," Special Agents' Series No. 150. The bulletin has been prepared primarily for American business men who have dealings in Switzerland, special attention being given to the jurisdiction of the several courts and to partnerships and corporations, powers of attorney, collection of debts, attachment, bankruptcy laws and laws relating to trusts and unfair competition. It is the work of Commercial Agent Archibald J. Wolfe, supplemented by Robert P. Shick of the Philadelphia bar and Phanor James Eder of the New York bar. Copies can be obtained for 10 cents.

New Incorporations

THE KINCANNON SILENT TRANSMISSION COMPANY of Boschob, Wis., has been incorporated with a capital stock of \$3,200 by J. J. Blaine, George C. Kincannon and others.

THE PYRINOL FLASHLIGHT COMPANY of New York, N. Y., has been incorporated with a capital stock of \$25,000 by F. Dameric, S. Goodman and N. F. Lefkadtis, 140 Liberty Street, New York City.

THE AUSTRALIAN GENERAL RAILWAY SIGNAL COMPANY of Gates, N. Y., has been chartered with a capital stock of \$10,000 by J. S. Fitch, H. Satterlee and L. A. Plumb of Rochester. The company proposes to manufacture railway signals, etc.

THE STANDARD ELECTRIC MANUFACTURING COMPANY of Jersey City, N. J., has been incorporated by Jules E. Brand, H. A. Black and Walter J. Hilton of Jersey City. The company is capitalized at \$200,000 and proposes to manufacture electrical appliances of all kinds.

THE EUGENE F. PHILLIPS ELECTRICAL WORKS, Ltd., of Montreal, Que., has been incorporated by Frank B. Common, Francis G. Bush, George R. Drennan and others. The company is capitalized at \$4,000,000 and proposes to manufacture hydraulic and compressed-air machinery, devices, etc.

THE BRECO ELECTRIC COMPANY of Toledo, Ohio, has been incorporated by M. G. Lang and H. A. Stafford of the E. Pauck Machine Company. The company is capitalized at \$50,000 and proposes to manufacture electric machines for charging storage batteries. The company, it is stated, holds valuable patents on several electrical appliances for automobile equipment, which will be manufactured later on. The office of the company is located at 206 Huron Street.

Trade Publications

BOX CONNECTOR. S. R. Fradlek & Company of Chicago have issued a leaflet descriptive of "Kwikon" box connections.

COAL CONVEYOR. — The Godfrey coal conveyor is illustrated and described in a circular prepared by John F. Godfrey of Elkhart, Ind.

ELECTRIC SOLDERING IRON. — The Dover Manufacturing Company of Dover, Ohio, has issued a folder descriptive of its garage special electric soldering iron.

WATER-COOLING SYSTEM. — Cooling water with sprays is the subject of bulletin No. 71 prepared by the American Spray Company, 26 Cortlandt Street, New York City.

PLUGS AND RECEPTACLES. — Harvey Hubbell, Inc., of Bridgeport, Conn., has prepared a leaflet descriptive of Hubbell interchangeable attachment plugs and T-slot receptacles.

CONDENSERS. — Bulletin No. 50, descriptive of the Rees rotorho patent rotary jet condensers, has been prepared by the Manistee Iron Works Company of Manistee, Mich.

WATT-HOUR METERS. — The General Electric Company of Schenectady, N. Y., has published an erratum to accompany bulletin No. 14,201A, on single-phase watt-hour meters.

INCLOSED FUSES. — "Union" renewable inclosed fuses for 250 volts and 600 volts are described in a leaflet prepared by the Chicago Fuse Manufacturing Company of Chicago and New York.

MILITARY CAMPS OF OUR ALLIES. — The Consolidated Expanded Metal Companies of Braddock, Pa., is distributing a book with this subject which has been copied from a pamphlet issued by the Expanded Metal Company, Ltd., of England.

FIXTURE SOCKETS. — The Wirt Company of Philadelphia, Pa., has published a leaflet entitled "Thrifty in Sugar Coats." This leaflet gives information on the various uses of the "Dim-A-Lite" and tests made by the Bureau of Standards on how this device saves electricity.

ELECTRIC WELDING. — The Wilson Welder & Metals Company, Inc., of New York City has prepared its catalog No. 2, on electric welding. This book includes information on the development of the Wilson system, specifications of equipment, portable equipment, size, weight and use of electrodes and schedule of equipment, table of economies, physical tests of welded joints, economy and operation, etc.

DEALERS' CATALOG. — A catalog confined entirely to electric socket and other appliances which may be sold over the counter to consumers has been prepared by the Mohawk Electrical Supply Company of Syracuse, N. Y. It is said that when this catalog was prepared the Goodwin movement of co-operation between the different classes of electrical business, especially that between jobber and contractor-dealers, was in mind. This catalog contains 120 pages.

MANUFACTURE OF IRON AND STEEL. — The Youngstown Sheet & Tube Company, Youngstown, Ohio, has issued an attractive calendar for 1918. It is featured by twelve large two-color illustrations of as many different operations in the manufacture of iron and steel. The plates were made from photographs taken in the works of the company and are both handsome and instructive. The calendar will be sent to any address on receipt of 4 cents in stamps to pay cost of mailing.

FIREBRICK. — Under the title "How Any One Can Make a Jointless, Gas-Tight Furnace Lining," the Betson Plastic Fire Brick Company of Rome, N. Y., has published a sixteen-page illustrated folder showing how the "plastic firebrick" made by it is used in forming one-piece linings for steam-boiler furnaces. The old lining of firebricks or blocks is first removed and the plastic material is then placed in the form of chunks, consolidated with a mallet and smoothed with a trowel, occupying the same thickness as the old lining. The special mechanical process used in the preparation of this material is said to eliminate expansion and contraction with temperature changes, so that not only side walls but also door arches, rear arches and arches for Dutch ovens and other forms of furnace can be formed as solid monolithic structures. After the material has been dried and set by a slow fire for four or five hours the furnace can be put into full service. No molds or special forms are used. The same material is used for baffles in water-tube boilers.

New England States

MANCHESTER, N. H.—The Public Service Commission has authorized the Manchester Traction, Light & Power Company to issue \$340,000 in bonds and coupon notes to an amount not exceeding \$1,500,000, the proceeds to be used for defraying the cost of new construction, most of which is required for a dam now under construction at Gregg's Falls.

HARWICH, MASS.—The Buzzards Bay Electric Light Company of Falmouth has been granted permission to erect transmission lines in Harwich to enable it to supply electricity to the government aviation plant at Chatham.

HAVERHILL, MASS.—The Haverhill Electric Company is installing a 5000-kw. Westinghouse turbine. J. E. Frank is superintendent.

HUDSON, MASS.—The town officials are planning the installation of a 600-kw. turbine with condenser and an additional boiler in the municipal electric-light plant. George A. Brothers is manager.

IPSWICH, MASS.—The Newburyport (Mass.) Gas & Electric Company has petitioned the selectmen for permission to erect its electric transmission line across certain streets in Ipswich in order to supply electricity to Ipswich Mills.

PALMER, MASS.—The Wright Wire Company is contemplating the construction of a rolling mill in Palmer, to have a daily capacity of 200 tons of steel. The company has purchased the Stephen Jones property on the west side of the Quabog River, on which the proposed plant will be erected. The plans provide for the construction of a power house a short distance down the river, where 9000 hp. will be generated. George M. Wright of Worcester is president of the company.

WEBSTER, MASS.—Work has been started by the Webster & Southbridge Gas & Electric Company on an addition to its plant in Webster to provide space for five new boilers of 400 hp. each, together with coal-handling and conveying machinery. Overhead bunkers will be built.

BLOOMFIELD, CONN.—The Board of Selectmen is considering extensions to the electric street-lighting system. The service is supplied by the Hartford (Conn.) Electric Light Company.

NEW HAVEN, CONN.—The Public Utilities Commission has given its approval to the petition of the Connecticut Company to erect electric transmission lines in New Haven and North Haven.

NEW HAVEN, CONN.—The Rock River Company, which is developing the water power of the Naugatuck Valley, at an estimated cost of between \$4,000,000 and \$5,000,000, expects to have the dam built near Stevenson and the water power developed by the latter part of 1918. J. Henry Roraback, attorney for the company, has consulted with Charles J. Bennett, highway commissioner, on the project to build a State highway to take the place of the road that is to be eliminated in connection with the construction of the proposed dam near Stevenson.

NORWICH, CONN.—The Eastern Connecticut Power Company has purchased the Warner property at Trading Cove. The use to which it is to be put has not been made public.

TORRINGTON, CONN.—The proposal to construct three reservoirs, near Torrington, to cost about \$1,300,000, is reported to be under consideration. C. H. Preston, Jr., of Waterbury is engineer.

WALLINGFORD, CONN.—The installation of an additional 250-hp. Porcupine boiler, with piping, etc., at the municipal electric-light plant is under consideration. A. L. Pierce is manager.

Middle Atlantic States

BORDER CITY, N. Y.—The Empire Gas & Electric Company has taken over the plant and holdings of the Empire Coke Company. The latter company furnishes gas to the former company, which supplies the cities of Auburn and Geneva and the towns of Waterloo, Seneca Falls and Lyons.

BROOKLYN, N. Y.—Plans have been filed by the E. W. Bliss Company for the erection of a large factory in Fifty-third Street near First Avenue, South Brooklyn. The new building will be 380 ft. by 200 ft., seven stories high, and will cost about \$1,400,000.

BUFFALO, N. Y.—The report of Bernard J. McConnell, fire chief, submitted to the City Council, giving an estimate of placing the wires of the fire and police departments underground in various sections of the city,

Construction

News of Projects, Plans, Bids and Contracts. Notes on Work Under Way

places the cost at about \$40,000. If it should be decided to place the wires in Genesee Street, from Jefferson to Bailey, underground, the additional cost is estimated at \$20,000.

CITY ISLAND, N. Y.—Plans are being prepared by the Kyle & Purdy Shipbuilding Company, Fordham Street, for the construction of a one-story power house.

IRVINE, N. Y.—Work has begun on the construction of a new power house for the National Forge & Tool Company in Irvine. When completed the plant will furnish electricity for lamps and motors in the village as well as to operate the works of the company.

NEW YORK, N. Y.—The capital stock of the Electric Reduction Company, 50 East Forty-first Street, has been increased from \$100,000 to \$500,000, to provide for extensions and improvements.

NEW YORK, N. Y.—The contract for the installation of a vacuum cleaner system in the Hotel Commonwealth has been awarded to the Spencer Turbine Cleaner Company of Hartford, Conn. The work consists of a central plant in the basement, with piping extensions to several hundred stations.

NIAGARA FALLS, N. Y.—The Prospect Electric Company of Niagara Falls has secured contracts for the electrical installations at the large plants of the National Electrolytic Company and the Niagara Alkali Company of Niagara Falls.

NORTH TONAWANDA, N. Y.—The capital stock of the Tonawanda Power Company has been increased from \$250,000 to \$750,000.

ROCHESTER, N. Y.—Notice has been filed by the Rochester Railway & Light Company of an increase in capital stock from \$10,250,000 to \$17,250,000 for expansion.

SALAMANCA, N. Y.—Contract has been awarded by the Board of Water, Light and Power Commissioners to G. F. Miller & Son, 58 East Elm Street, for the construction of an addition to the municipal electric-lighting plant.

JAMESBURG, N. J.—Plans are being prepared by F. H. Bent, State House, Trenton, for the installation of a new heating system to cost about \$5,000 at the New Jersey State Home for Boys.

NEWARK, N. J.—Plans have been prepared by the Butterworth-Judson Company, Avenue R, for the erection of a new one-story power house, about 85 ft. by 95 ft., at its works on Roanoke Avenue, to cost about \$24,000.

NEWARK, N. J.—Plans are being considered by the Public Service Railway Company for extending its electric railway system from Newark to Port Newark, via Avenue R, to reach the large shipbuilding plants at the latter place.

CHESTER, PA.—The Philadelphia (Pa.) Electric Company, it is reported, because of war conditions, has abandoned temporarily the construction of its proposed power plant at Beach and Palmer Streets, the preliminary work for which was started last fall.

CONNELLSVILLE, PA.—The West Penn Power Company of Conneltsville has filed petitions with the Public Service Commission asking for approval of franchises and contracts with the boroughs of Carmichaels, Bentleyville, North Irwin, Clarksburg, Jefferson and Rice Landing, covering the construction of electric-lighting systems and electric-lighting contracts in the above boroughs.

FRANKFORD, PA.—Contracts will soon be awarded for the construction of an artillery range firing house, power house and bomb-proof building at the Frankford Arsenal for the United States government. Lowest bid was submitted by William R. Dougherty.

HARRISBURG, PA.—The City Council, in its annual budget for the year, has made a requisition for an appropriation of \$63,833 for electric street-lighting for a section of the city.

HARRISBURG, PA.—An ordinance has been adopted by the City Council, providing for the consolidation of the lighting, police and fire-alarm bureaus into one department, to be known as the City Electrical Bureau, and which will be in charge of Clark E. Diehl, city electrician.

HAZLETON, PA.—One of the large turbo-generators in the plant of the Harwood Electric Company was recently damaged by fire, causing a loss of about \$25,000.

LANCASTER, PA.—Notice has been filed by the Edison Electric Company with the Public Service Commission of an issue of \$75,000 in capital stock, the proceeds to be used in part payment for the acquirement of the property of the Akron Electric Light & Power Company.

MANAYUNK, PA.—Plans have been filed by the Glen Willow Ice Manufacturing Company, 3517 Main Street, for the construction of a power house, 35 ft. by 75 ft. Contract has been awarded to the Brown Construction Company, 4600 Main Street, for construction of building.

NEW BRIGHTON, PA.—The Borough Council has awarded the Beaver County Light Company a contract for lighting the streets of the borough for a period of three years.

PHILADELPHIA, PA.—The United States government is planning the erection of a one-story power house at the Frankford Arsenal, Philadelphia.

PHILADELPHIA, PA.—Plans have been prepared for alterations and improvements in the administration building of the Bell Telephone Company at Eleventh and Filbert Streets.

PHILADELPHIA, PA.—Contract has been awarded by F. A. Poth & Sons, Thirty-first and Jefferson Streets, to Charles Casper, Horner Building, for the construction of an addition to boiler house, to cost about \$18,000.

READING, PA.—Notice has been filed with the Public Service Commission by the Metropolitan Edison Company of an issue in capital stock of \$316,300, the proceeds to be used for extensions, improvements, etc.

WEST CHESTER, PA.—The Philadelphia Suburban Gas & Electric Company, which has a large electric plant on the Schuylkill River at Crombie, it is reported, is contemplating the erection of an electric transmission line from that place to Coatesville for the purpose of connecting its plant with the power plant of the Chester Valley Electric Company, to be used in case of emergencies. West Chester, Phoenixville and Pottstown are already connected. The Lenape plant is connected by a high-tension line with the Chester Valley Company's plant at Coatesville.

INDIAN HEAD, MD.—Contract has been awarded by the Bureau of Yards and Docks, Navy Department, Washington, D. C., to the Austin Company, Bulletin Building, Philadelphia, Pa., for the construction of an addition to power house, 40 ft. by 60 ft., with other building, 30 ft. by 100 ft., at the naval proving ground at Indian Head, to cost about \$40,000; also pulping and poaching house, 60 ft. by 200 ft., with monitor and two blending towers, 38 ft. by 35 ft., and 123 ft. by 35 ft.

RIISING SUN, MD.—Bonds to the amount of \$8,000 have been sold, the proceeds to be used for improvements to the municipal electric-lighting plant.

CHARLESTON, W. VA.—The West Virginia Water & Electric Company, it is reported, is considering an increase in its capitalization to provide for expansion.

RICHMOND, VA.—Plans are being prepared for a tobacco factory for the Allen & Ginter Tobacco Company, a branch of Liggett & Myers Tobacco Company of St. Louis, Mo. The proposed building will be six stories high, main frontage 86 ft. by 286 ft.; two wings, 86 ft. by 152 ft. and 86 ft. by 109 ft. respectively, forming U-shaped building with boiler house and engine room in the rear. Automatic conveyors to deliver coal to overhead bumpers, automatic sprinkler system and four electric elevators will be installed.

WASHINGTON, D. C.—The Secretary of the Interior recently recommended and the President has approved, the inclusion within a power site reserve of about 196 acres of public land in the Big Sandy River Basin, Ore., in order that this land may be used in connection with the development of power, but not for other purposes. The land recommended for withdrawal is located near or adjacent to Big Sandy River below the mouth of Salmon River. A tract within the Eldorado National Forest, Cal., for power site purposes has also been recommended by the Secretary of the Interior and approved by the President.

WASHINGTON, D. C.—Bids will be received at the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., for furnishing at the various navy yards and naval stations supplies as follows: Puget Sound, Wash., Schedule 1646—miscellaneous single and two-conductor lighting and power cable and wire, and interior communication cable. New York, N. Y., Schedule 1647—miscellaneous rubber-covered duplex wire; Schedule 1649—miscel-

laneous twin conductor, plain and leaded and armored wire. South Charleston, W. Va., Schedule 1641, miscellaneous wet tool and power vibrating device drill grinders, Mare Island, Cal., Schedule 1639, 100,000 ft. plain bell wire. Application for proposed blanks should designate the schedule desired by number.

North Central States

AKRON, OHIO. Plans are being prepared by William C. Owne & Company of Cleveland, engineers, for the construction of a factory and power plant for the Akron Billwell Tire & Rubber Company of Akron.

CLEVELAND, OHIO.—The Elliott Electric Company, manufacturer of electrical devices, contemplates the erection of an addition to its plant.

CLEVELAND, OHIO.—The Canada Gas & Electric Corporation, recently incorporated under the laws of Delaware, with a capital stock of \$2,500,000, with headquarters in Cleveland, will open many branches in the principal cities throughout Canada. A branch has already been established in Brandon, Man. The company is contemplating the construction of many plants and all business will be transacted through the headquarters at Cleveland. Electric equipment, wire, generators, transmitters, etc., will be required. Cyrus S. Eaton, Cuyahoga Building, Cleveland, is president.

MONROEVILLE, OHIO.—Connections have been made with the Lake Shore Electric Shore service and the new lighting system was put in operation recently and a 24-hour service established. The municipal plant will be held in readiness for use in case of emergencies. Connections will be made next summer with both the east and west end power plants of the electric company.

OWENSBORO, KY.—Preparations are being made by the Owensboro Home Telephone & Telegraph Company for improvements to its system, including the installation of a new switchboard, etc., to cost about \$50,000. Contracts have been awarded for the work.

UZ, KY.—The West Virginia & Kentucky Coal Company, it is reported, would like to receive prices on copper wire, hangers and bonds. Thomas P. Jones of Uz is manager.

INDIANAPOLIS, IND.—The William A. Corroa Electric Company, a Missouri corporation, has been granted a charter to do an electrical contracting business in Indiana. C. E. Crowley of East Chicago, Ind., is named as agent.

KENDALVILLE, IND.—Improvements are being made to the water-works system, including the construction of a 500,000-gal. reservoir (completed) and the installation of three motor-driven centrifugal pumps, already contracted for and to be installed in April. S. E. Dickinson is superintendent.

PIERCETON, IND.—Plans are being considered to secure electricity from Winton, 7 miles west of Piercet, in the spring, to operate the municipal electric-lighting system. About 65 hp. in motors have been installed during the last year. J. R. Winsley is superintendent.

CENTRALIA, ILL.—The Southern Illinois Light & Power Company of Hillsboro has taken over the utility plants in Centralia and, it is said, will make this city a distributing center for various systems controlled by the company. The plants which will be controlled from Centralia are at Mount Vernon, Du Quoin, Chester, Sparta, Collinsville, Litchfield, Hillsboro and Nashville.

KEWANEE, ILL.—The City Council has awarded the contract for wiring the new water-works plant to Messrs. Smith and May.

MURPHYSBORO, ILL.—Application has been filed with the Public Utilities Commission by the Murphysboro & Southern Illinois Railway Company for permission to issue \$63,000 in capital stock and \$250,000 in bonds. The company is constructing a railway between Murphysboro and Carbondale, and the new capital is desired to extend the car line from Carbondale to Carterville or to Herrin.

ROCKFORD, ILL.—The Rockford Electric Company is equipping its former power plant at the corner of Wyman and Chestnut Streets as an auxiliary heating station.

MINNEAPOLIS, MINN.—Plans have been announced for the reconstruction of the Minneapolis, St. Paul, Rochester & Dubuque Electric Traction Company's railway from the Minneapolis terminal at Seventh Street and Third Avenue, N., to Northfield and Faribault, to cost approximately

\$750,000. If the plans go through the road will be equipped for electrified operation for freight and heavy traffic as well as for passenger traffic. C. T. Hainboer, who was receiver for the railroad, is in charge of the proposed plan.

ST. PAUL, MINN.—The Twin City Rapid Transit Company of Minneapolis is erecting an automatic substation at Concord and Isabel Streets, St. Paul. The new station will have an output of 2000 hp.

EDDYVILLE, IOWA.—An election will be called within 60 days to vote on the proposal to issue \$10,000 in bonds for improvements to the municipal electric-light plant. It is proposed to change the system from direct current to alternating current. A Lieberman is manager.

GRUNDY CENTER, IOWA.—The Grundy Center Electric Company is erecting about 5 miles of electric transmission lines to supply electricity in the farming districts. J. B. Calderwood is owner and manager.

SUMNER, IOWA.—The erection of an electric transmission line between Sumner and Tripoli is reported to be under consideration.

GREGORY LANDING, MO.—The Gregory Drainage District is contemplating the construction of a pumping station, to cost about \$75,000. The Edmund T. Perkins Engineering Company of Quincy, Ill., is engineer.

KANSAS CITY, MO.—The Southwestern Bell Telephone Company has awarded the general contract to the Swenson Construction Company, Shubert Theater Building, for construction of a new telephone building 14 stories and basement, at the corner of Eleventh and Oak Streets, to cost about \$800,000.

KANSAS CITY, MO.—The city officials have authorized R. E. McDonnell, of the engineering firm of Burns & McDonnell, and Burton Lowther, chief engineer of the water department, to make surveys to establish the first unit of a municipal electric-light plant in conjunction with the Turkey Creek pumping station of the water works system. It is proposed to install a plant at the Turkey Creek station to provide electricity for that district bounded by Twelfth and Thirty-fifth Streets, from Main Street to the State Line.

OREGON, MO.—The City Council is considering the purchase of electricity to operate the municipal electric-lighting system from the St. Joseph Transmission Company for a period of ten years.

ST. LOUIS, MO.—F. C. Adams of St. Louis has been appointed chairman of the committee representing the electrical interests of St. Louis on the board of a permanent organization which has been formed to urge the advantages which this city possesses as a center for the manufacture of materials for the government which will be needed in the prosecution of the war.

BELFIELD, N. D.—The City Council is considering the purchase of the Chrysler Light & Power Company, to be owned and operated by the municipality.

BLOOMFIELD, NEB.—The Nebraska Electric Company of Cedar Rapids, Iowa, has been granted permission by the State Railway Commission to erect an electric transmission line between Bloomfield and Hartington. The company operates electric plants at both towns and desires to connect them for commercial purposes. This, it is understood, is the beginning of a transmission system to cover most of northeastern Nebraska.

OMAHA, NEB.—The City Council has decided to install an ornamental lighting system on Leavenworth Street, from Sixteenth Street to Park Avenue. Lamps similar to those on Farnam Street will be used.

CHANUTE, KAN.—Contracts have been awarded by the Commissioners of Public Utilities for improvements to the municipal electric-light plant as follows: For building to George A. Copley of Chanute, at \$4,440, and to the Merkle Machinery Company, Inter-State Building, Mo., for boilers and machinery, at \$19,900.

MACKSVILLE, KAN.—The local electric light plant, it is reported, was recently damaged by fire.

WICHITA, KAN.—Bids will be received by the Wesley Hospital Commission, care of O. A. Rorabaugh, chairman of building commission, Wichita, until Jan. 15 for construction of hospital building, five stories and basement, 236 ft. by 44 ft., with wings, 44 ft. by 16 ft., and 58 ft. by 44 ft., including steam heating, plumbing, electric wiring, telephone system, silent call system, ventilating fans, vacuum cleaner, freight and passenger elevators, etc. The cost of the first unit is estimated at \$250,000. Richards, McCarty & Bulford, Columbus, Ohio, are architects. A. H. Kagy, 402 Sedgwick Block, is local manager.

Southern States

LEXINGTON, N. C.—The Columbia Power Company has filed an amendment to its charter increasing its capital stock to \$250,000. Dermitt Shemwell is president.

SOUTHERN PINES, N. C.—John T. Patrick of Southern Pines, it is reported, is in the market for electrical machinery (second-hand) for a water-power development of from 25 to 50 hp.

ATLANTA, GA.—Plans have been adopted by the City Council for the installation of an electric generating plant at the city crematory, to cost about \$75,000. The Georgia Railway & Power Company has agreed to purchase all electrical energy generated at the plant, paying for it at the same rate that the city now pays the company for electricity for lighting and power purposes.

PORT WENTWORTH, GA.—Plans have been prepared by Sprout, Waldron & Company of Muncy, Pa., for the construction of a meal mill and grain elevator for the Port Wentworth Mill & Elevator Company, recently organized. Fred C. Beckham is manager.

GAINESVILLE, GA.—The Southern Bell Telephone & Telegraph Company has awarded contract to A. J. Krebs & Son of Atlanta, for construction of new exchange building in Gainesville. The company also plans to change all stations to drop system and place overhead wires in the business district underground. The cost of the improvements is estimated at \$50,000.

JACKSONVILLE, FLA.—The Jacksonville Traction Company has been granted a franchise by the County Commissioners to construct a car line from Ortega to Camp.

MEMPHIS, TENN.—The Memphis Gas & Electric Company has purchased 1100 acres of coal lands at Mannington, Christian County, with two mines already developed, which it will operate to obtain its coal supply.

FLORENCE, ALA.—Contract has been awarded by the Ammonium Nitrate Air Nitrates Corporation, controlled by the United States government, for designing and constructing manufacturing buildings, workmen's houses, streets, sewers for a complete plant, excepting power plant, for the manufacture of ammonium nitrate, near Muscle Shoals, to the Westinghouse, Church, Kerr Company, 37 Wall Street, New York, N. Y. J. W. Young of New York, N. Y., is superintendent of construction at Florence; F. E. Caldwell of New York, N. Y., is resident engineer at Florence.

MOBILE, ALA.—The Mobile Electric Company is planning to erect an electric transmission line (5 miles long) to supply electricity to the plant of the Chickasaw Shipbuilding Company, now under construction.

MOBILE, ALA.—The Mobile & Ohio Railroad Company is contemplating improvements to grain elevator and pier on which it is located, involving an expenditure of about \$115,000. The proposed work will include reconstruction of a 250,000-bushel grain elevator, which has been out of commission 10 years; replacing steam power with electrically-operated machinery, building 600 ft. of overhead conveyor in order to convey grain to ships. R. C. Stone Engineering Company, Merchants' Exchange Building, St. Louis, Mo., will have charge of installation of elevator machinery. B. A. Wood, chief engineer of maintenance of ways and structures of the company, will have charge of the proposed improvements.

ONEONTA, ALA.—The plant and holdings of the Oneonta Utility, Water & Light Company have been purchased by the Alabama Water Company. The new owners, it is stated, will install new pumps, mains and fire hydrants at once.

GULFPORT, MISS.—The local power house of the Gulfport & Mississippi Traction Company, which supplies electricity in Gulfport, Ocean Springs, Pass Christian, Hattiesboro and Biloxi, was recently badly damaged. The plant had been idle for some days owing to a strike.

MAGEE, MISS.—Contract has been awarded to the Inglenook Construction Company of Birmingham, Ala., for the construction of buildings for nurses' home, servants' building, power house and cold-storage plant at the Mississippi State Tubercular Sanatorium. B. Price, 518 Empire Building, Birmingham, Ala., is architect. For information address Dr. Henry Boswell, at Magee.

BARATARIA, LA.—Bids will be received at the Bureau of Yards and Docks, Navy Department Washington, D. C., until Jan. 21 for constructing two 125-ft. steel towers on concrete and timber pile foundations, one 12,000-gal. water tank, dormitory and receiving buildings with equip-

ment and water, electric-light and power and sewerage systems at the Naval Radio station at Barataria Bay, La. Drawings and specifications (No. 2686) may be obtained upon application to the above bureau or to the commandant of the naval station, New Orleans.

THIBODAUX, LA.—The Southern Traction & Utilities Company, it is reported, is planning to construct an electric railway from Donaldson to Bayou Lafourche, a distance of 56 miles. Practically all of the right of way has been secured. C. C. Barton of Albemarle is president of the company.

BRISTOW, OKLA.—The City Council is considering taking over the local electric-light plant, to be owned and operated by the municipality. The price, it is understood, is placed at \$25,000.

CHANDLER, OKLA.—The Chandler Electric Company, it is reported, is contemplating the construction of a new power house and installation of new equipment.

HOOKER, OKLA.—The electrical apparatus in the municipal electric-light plant was recently destroyed by fire, causing a loss of about \$22,000. There was no insurance and the city will have to issue bonds to install a new plant.

MIAMI, OKLA.—Plans are being considered by the Bilharz Mining Company for the construction of a central electric power plant to supply energy for plants 1, 2 and 3.

SAPULPA, OKLA.—The board of education has awarded the general contract to the Manhattan Construction Company of Muskogee for construction of high school building at \$179,872. Contract for heating and electric wiring has not yet been placed.

SEMINOLE, OKLA.—At an election held recently bonds to the amount of \$5,000 were voted for the installation of an electric-light plant.

BURNET, TEX.—The power house at the mine of the Southwestern Graphite Mine was recently destroyed by fire, causing a loss of about \$6,000.

McALLEN, TEX.—The Rio Grande Public Service Corporation contemplates extensive improvements to its local plant, involving an expenditure of about \$40,000. R. F. McCord is manager.

ORANGE, TEX.—The Orange (Tex.) County Irrigation Canal Company is contemplating the installation of a new pumping plant, to cost about \$25,000.

SABINAL, TEX.—The electric plant and ice factory of the Sabinal Light & Ice Company has been purchased by R. T. Robinson of San Antonio. The new owner, it is understood, will enlarge the plant and make other improvements to the property.

SAN BENITO, TEX.—The Commonwealth Electric Light & Water Company is planning to enlarge its power house and will install a new 100-hp. engine and other equipment in its plant.

SAN MARCOS, TEX.—Bids will be received until Jan. 14 by A. C. Goeth, of Austin, president of the State Normal School Board of Regents, Austin, for the construction of buildings, including heating, plumbing and wiring, for the Southwest Texas State Normal School at San Marcos and Sam Houston State Normal School at Huntsville. C. H. Page & Brothers of Austin are architects for the school at San Marcos, and Endress & Watkins, Austin and Houston, are architects for the school at Huntsville.

Pacific and Mountain States

SEATTLE, WASH.—The City Council has authorized the erection of a substation for the Light Department on B 166 Gilman Park Addition, and appropriated \$20,000 for same.

SEATTLE, WASH.—An ordinance has been introduced in the City Council directing the Board of Public Works to purchase the railway and equipment of the Loyal Railway Company, to be operated as a part of the municipal street car system. Harry Whitney Treat, owner of the Loyal Heights line, has agreed to sell the property for \$40,000.

SHELTON, WASH.—The Commissioners of Mason County have granted the Shelton Light & Power Company a franchise to erect and operate electric transmission lines over the highways of Mason County.

SPOKANE, WASH.—Plans have been prepared by the Washington Water Power Company for extending its electric transmission line into Coeur d'Alene. The company is planning to issue \$2,800,000 in notes, of which \$640,000 will be used for extensions and improvements and the remainder for refunding purposes.

TACOMA, WASH.—Plans are being considered for placing the electric wires of the Municipal Electric Light Department underground, for which estimates of cost are being prepared.

BANDON, ORE.—Contract has been awarded by the Glenisch & Joplin Condensed Milk Company of Portland to the Northwest Process Company of Portland for the construction of a milk condensing plant in Bandon, to cost about \$100,000. The building, 106 ft. by 240 ft., two stories, will be located on the water front with a detached power house, 40 ft. by 60 ft.

BYRON, CAL.—Improvements are being made by the Sierras & San Francisco Power Company of San Francisco, which supplies electricity in this district, involving an expenditure of \$25,000, to meet the demands for electrical service for irrigation and other purposes. The work will include the erection of a 17,000-volt transmission line from pumping plant No. 1 of the Byron-Bethany system to plant No. 4, near the Brentwood border, a distance of about 12 miles. Later the local distribution lines in Byron and Brentwood will be rebuilt.

CHICO, CAL.—The City Council is considering a proposal submitted by the Northern California Power Company for lighting the streets of the city for a period of four years. The company agrees to furnish electricity to maintain the entire system at \$275 per month. The contract provides for larger lamps in the residence districts, the cost of which has not yet been determined, and which the city will bear.

CORONA, CAL.—The Southern Sierras Power Company, which operates in Inyo, Kern, San Bernardino and Riverside Counties, is planning to take over the property and holdings of the Corona Gas & Electric Light Company, which operates in Riverside County. Both companies are practically owned by the same interests.

EUREKA, CAL.—The Rolph Shipbuilding Company has taken over the Bendixson ship timber mill, which it proposes to enlarge and equip for electric motor drive. Electrical service is supplied by the Western States Gas & Electric Company, which is installing a larger transformer at the yards of the company.

HANFORD, CAL.—The city trustees have entered into a contract with the H. G. Lacey Company for service for the downtown electric-lighting district for a period of two years, at \$11,400.

LA GRANGE, CAL.—The Railroad Commission has authorized the Sierra & San Francisco Power Company to use \$13,670 from the sale of its \$1,000,000 bond issue for additions and improvements to the La Grange division of the Yosemite Power Company, recently purchased by the company.

OAKLAND, CAL.—The Commission Merchants' Protective Association has petitioned the City Council for the installation of additional street lamps on lower Franklin Street.

OAKLAND, CAL.—The Kings Electric Company, Oakland Bank of Savings Building, has been awarded contract for electrical work in public library building at Fifty-sixth Street and San Pablo Avenue, at \$1,955; also for public library building at Fifty-second Street and Telegraph Avenue, at \$1,955.

PALO ALTO, CAL.—The City Council has decided to call a special election to vote on the proposal to issue \$66,000 in bonds for the purchase of a Diesel engine and electric generator for the municipal electric-light plant.

RIVERSIDE, CAL.—The National Ice Company, it is understood, is contemplating using electricity instead of water power to operate its plant.

RIVERSIDE, CAL.—The Board of Public Utilities Commission has decided to offer for sale to the Southern California Edison Company all the city pole line north of the city limits, provided it will move the point of delivery from Palm and Mount Vernon Avenues in San Bernardino County to the Riverside city limits on La Cadena drive. If the sale is not consummated a rental agreement may be made whereby the Edison company will secure the use of the poles for an extension of its transmission lines to the city limits.

SAN BERNARDINO, CAL.—Extensive improvements are contemplated by the Atchison, Topeka & Santa Fe Railroad Company at its local works which include the construction of a new blacksmith shop, an electric power plant and subway. The cost of the electric plant and blacksmith shop is estimated at \$240,000.

SALT LAKE CITY, UTAH.—A permit has been granted the Latter Day Saints Church to erect a power plant, to cost about \$30,000.

SALT LAKE CITY, UTAH.—An agreement subject to the approval of the State Public Utilities Commission is to be entered into between the Commissioners of Salt Lake County, the Utah Power & Light Company and the Progress Company for lighting the public roads and streets of the county with electricity for a period of 20 years. Under the terms of the contract the company is to furnish a minimum of 400 lamps.

LIBERTY, ARIZ.—The mining company at Liberty, it is reported, contemplates the installation of electric lighting, water and sewer systems for the proposed town near the mine. Lescher & Kibbey of Phoenix are engineers.

CASPER, WYO.—The electric plant of the Natrona Power Company was recently destroyed by fire, causing a loss of about \$150,000.

CARSON CITY, NEV.—The Board of City Trustees is considering extending the street-lighting system throughout the city. The Truckee River General Electric Company of Reno furnishes electrical service in Carson City.

RATON, N. M.—The Superior Coal Company of Raton, it is reported, is in the market for a second-hand storage battery locomotive, 36-in. gage, with 12 nickel-iron batteries, preferably Jeffrey make.

SILVER CITY, N. M.—The large Diesel engine in the plant of the Silver City Power Company was recently damaged by an explosion, causing a loss of about \$10,000.

Canada

BASSANO, ALTA.—The purchase of an electrically driven pumping unit, to cost about \$2,000, is under consideration by the Water Works Department. George W. Murtagh is engineer.

NELSON, B. C.—Application has been made to the council by the Kootenay General Hospital for the installation of an electric-lighting system, to cost about \$1,180.

VANCOUVER, B. C.—The British Columbia Telephone Company is planning to lay another submarine cable across False Creek, work on which will soon begin.

VANCOUVER, B. C.—An electric-lighting plant, it is understood, will be installed at the shipbuilding yards of J. J. Coughlan & Sons; also 12 electrically operated cranes.

BARTON TOWNSHIP, ONT.—The township of Barton is considering the purchase of electrical equipment, to cost about \$55,000.

GALT, ONT.—A by-law has been passed by the ratepayers appropriating \$45,000 to pay for extension to municipal hydroelectric system.

MERRICKVILLE, ONT.—The Rideau Power Company has authorized the Hydro-Electric Power Commission of Ontario to prepare plans and purchase the necessary equipment for high-tension service for its power house in order to supply power to the commission.

RENFREW, ONT.—The International Molybdenum Company is planning to remove its plant from Orillia to Renfrew. Power for operating the plant will be secured from the Calabogie Light & Power Company.

TORONTO, ONT.—The Hydro-Electric Power Commission, it is reported, is planning to build a third tunnel at the plant of the Ontario Power Company (the plant purchased by the Hydro-Electric Commission), which it is expected will develop an additional 50,000 hp., to be utilized by plants manufacturing munitions for the war. Work, it is understood, will begin at once and will be completed within a few months. The cost is estimated from \$1,500,000 to \$2,000,000.

WELLINGTON, ONT.—The Town Council is considering an issue of \$10,000 in debentures for the purpose of purchasing the local electric-lighting system and remodeling it. The Niles estate, owner of the distributing system, has agreed to sell it to the town for \$3,000.

WHITBY, ONT.—Work has begun in Whitby on a track from the station on the Grand Trunk main line to the military hospital on the lake front. This road will be the initial unit of street railway system in Whitby, authorized by a vote of the municipality in adopting the Hydro radial proposal from Toronto to Whitby.

VALLEYFIELD, QUE.—The Montreal Cottons, Ltd., it is understood, will rebuild its power plant, recently destroyed by fire, at once, causing a loss of about \$100,000. The plant had a generating capacity of 4300 hp.

(Issued Dec. 18, 1917)

1,250,129. INCANDESCENT ELECTRIC LAMP SOCKET. Carl H. Russell, Syracuse, N. Y. App. filed June 22, 1911. Comprises, generally, a base having two sections, one of the sections being formed with a recess opening through the end face thereof opposed to the other section, and such other section serving as a closure for the recess, wire terminals and lamp-contact terminals carried by the base, a switch being placed in the recess.

1,250,110. PROCESS FOR LOOSENING THE SKINS OF TOMATOES AND THE LIKE; William H. Chapman, Portland, Me. App. filed April 25, 1917. A comb conductor charged with high-voltage alternating

1,250,324.—Electrical Switch Instrumentality.

electricity is located adjacent to the tomato and the apparatus is so formed and manipulated that all portions of the skin are presented to the discharging points.

1,250,142. BUFFER FOR RAILWAY CARS; Samuel S. Cole, Cokeburg, Pa. App. filed May 8, 1917. Improvements.

1,250,146. ELECTROLYTIC APPARATUS; John Coulson, Wilkinsburg, Pa. App. filed Jan. 6, 1917. Improvements.

1,250,152. AUTOMATIC SWITCH; Carl W. Eisenmann, Nebraska City, Neb. App. filed April 5, 1916. For use in connection with storage-battery systems.

1,250,164. SYNCHRONOUS-BOOSTER ROTARY CONVERTER; Floyd T. Hague, Pittsburgh, Pa. App. filed Nov. 12, 1915. Provides means for the exact regulation of the commutating field in order to insure effective commutation under all conditions of load.

1,250,175. JUMPER CABLE TAP; Albert F. Hills, Syracuse, N. Y. App. filed June 19, 1911. Comprises, generally, a body, a fixed jaw carried by the body, and a spring-pressed jaw movable toward and from the fixed jaw.

1,250,188. ENGINE-STARTING SYSTEM; Charles F. Kettering and William A. Chryst, Dayton, Ohio. App. filed Sept. 13, 1913. Improvements.

1,250,192. TELEPHONE REPEATING INSTRUMENT; Charles D. Lanning, Boston, Mass. App. filed Jan. 21, 1901. Improvements.

1,250,210. FLUID-PRESSURE-CONTROLLED SWITCH; Harry Y. Norwood and Fred K. Taylor, Rochester, N. Y. App. filed May 20, 1915. Improvements.

1,250,211. CONTROL SYSTEM; Stanley G. Nottage, Wilkinsburg, Pa. App. filed Oct. 9, 1915. For dynamo-electric machines.

1,250,231. ELECTRICALLY PROPELLED VEHICLE; Theodore H. Schoff, Pittsburgh, Pa. App. filed May 3, 1915. Improvements.

1,250,243. SYSTEM OF DISTRIBUTION; Norman W. Storer, Pittsburgh, Pa. App. filed April 4, 1914. Means for supplying a suitably low voltage to a receiving circuit from a supply circuit of relatively high voltage.

1,250,250. HIGHWAY SIGNALING APPARATUS FOR RAILROAD SERVICE; Eugene W. Vogel, Oak Park, Ill. App. filed June 5, 1914. Grade crossings.

1,250,286. ELECTROLYTIC APPARATUS; John Coulson, Wilkinsburg, Pa. App. filed Jan. 6, 1917. Means for forming each set of plates composing such apparatus from a single set of film-forming material.

1,250,290. CONTROL MECHANISM FOR PREVENTING EXCESSIVE SPEED OF MOTOR

Record of Electrical Patents

Notes on United States Patents

VEHICLES; Richard A. Dunern, Adelaide, South Australia, Australia. App. filed Dec. 28, 1915. Improvements.

1,250,302. ELECTRIC LIGHT CONTROLLER; Raphael A. Granquist, West Duluth, Minn. App. filed April 8, 1914. The apparatus is constructed in such a manner as to permit of its being housed in the canopies of the fixtures so as to be concealed from view and yet ready of access should repairs be necessary.

1,250,324. ELECTRICAL SWITCH INSTRUMENTALITY; Hubert F. Krantz, Brooklyn, N. Y. App. filed March 13, 1915. Creates a compact few-part switch-moving mechanism conducive to a greatly simplified panelboard arrangement.

1,250,342. RECEPTACLE FOR ELECTRIC LAMPS; Axel V. Olson, San Francisco, Cal. App. filed July 8, 1914. Sign receptacle.

1,250,387. ELECTRIC INSULATOR; Percy H. Thomas, Upper Montclair, N. J. App. filed May 16, 1913. Insulator is of the suspension type and is adapted to extra-high-tension service.

1,250,401. ELECTRIC HAMMER; Alex. Wendelburg, New York, N. Y. App. filed July 28, 1914. Improvements.

1,250,467. PIPE CLAMP; Frederick I. Johnson, Warren, R. I. App. filed Feb. 1, 1917. For grounding or bonding electric wires.

1,250,501. ELECTRIC SWITCH; Clarence D. Platt, Bridgeport, Conn. App. filed Aug. 2, 1916. Improved.

1,250,502. COMBINATION ELECTRIC SWITCH; John E. Powers, Pike, N. Y. App. filed Jan. 8, 1917. For use in connection with automobiles or other vehicles.

1,250,536. ELECTRIC DISTRIBUTING SYSTEM; William L. Waters, Milwaukee, Wis. App. filed May 25, 1914. Improvements.

1,250,708. EMERGENCY STOP FOR ELECTRICALLY DRIVEN APPARATUS; Caswell D. Swett, Redwood City, Cal. App. filed April 5, 1916. Improvements.

1,250,716. HOLDER FOR TELEPHONE RECEIVERS; Katherine G. Townsend, New York, N. Y. App. filed Jan. 27, 1917. Low-cost device.

1,250,718. DYNAMO-ELECTRIC MACHINE; William A. Turbayne, Niagara Falls, N. Y. App. filed Dec. 24, 1912. Adapted for efficient operation as a motor where great variations in speed are desired.

1,250,719. VARIABLE-SPEED MOTOR; William A. Turbayne, Niagara Falls, N. Y. App. filed Dec. 31, 1912. Improved means for reducing the effects of armature reaction at high speed.

1,250,720. STARTING AND LIGHTING SYSTEM; William A. Turbayne, Niagara Falls, N. Y. App. filed Dec. 26, 1912. Close inherent regulation is obtained.

1,250,731. X-RAY SYSTEM; Harry F. Waite, New York, N. Y. App. filed March 22, 1917. Hot cathode is employed.

1,250,743. ELECTRICALLY PROTECTED HOLDER FOR POCKETBOOKS AND SIMILAR ARTICLES; John P. Williams, New York, N. Y. App. filed July 28, 1915. Improved.

1,250,746. TIME-LIMIT TRIPPING MECHANISM; George Wolff, Berlin, Germany. App. filed Jan. 21, 1914. Improvements.

1,250,752. APPARATUS FOR PRODUCING AN ELECTROMOTIVE FORCE FOR SPECIAL WAVE FORM; Ernest F. W. Alexanderson, Schenectady, N. Y. App. filed Aug. 22, 1914. Improvements.

1,250,754. ELECTRIC-CIRCUIT CONTROLLER; Johan M. Andersen, Boston, Mass. App. filed April 29, 1914. Means for locking the movable member of the switch in its closed position, so as to prevent accidental opening of the switch.

1,250,757. ELECTRODE USED IN THE ELECTROLYTIC PROCESS OF REFINING METALS; Frank L. Antisell, Perth Amboy, N. J. App. filed Feb. 8, 1913. Improvements in anodes and cathodes used in the multiple system in the electrolytic process of refining copper and other metals.

1,250,769. SIGNALING SYSTEM; Clarence E. Beach, Binghamton, N. Y. App. filed

Dec. 18, 1916. May be employed as combination fire-alarm and police signaling systems, as combination watchman's time detector and fire-alarm systems, as combination watchman's time detector, fire-alarm and police call systems, and as combination fire dismissal and fire-alarm systems adapted for use in factories and buildings where many persons congregate.

1,250,782. ELECTRIC CLOCK; John G. Blessing, Chicago, Ill. App. filed April 2, 1917. Ratchet mechanism and electric switch are simplified.

1,250,804. SELECTIVE SIGNALING SYSTEM; Leslie E. Coon, Chatham, N. J. App. filed June 18, 1917. Provides means whereby an audible signal, such as a single-stroke bell, may be operated at all stations simultaneously and in consonance with impulses from an extraneous source, such as time signals over a telegraph line.

1,250,806. TIME-LIMIT RELAY; James R. Craighead, Schenectady, N. Y. App. filed Sept. 2, 1914. Improvements.

1,250,815. INCANDESCENT LAMP; Frank M. Dorsey, Cleveland, Ohio. App. filed Feb. 5, 1914. Tungsten or like metal.

1,250,834. CURRENT REGULATOR; Charles Le G. Fortescue, Pittsburgh, Pa. App. filed June 21, 1912. Relates to constant-current regulators and to systems of distribution embodying the same.

1,250,835. ELECTRICAL DISTRIBUTING SYSTEM; Charles Le G. Fortescue, Pittsburgh, Pa. App. filed June 21, 1912. Special relation to alternating-current rectifying systems comprising constant-current regulators.

1,250,854. ELECTRICAL REGISTERING SYSTEM; Charles L. Goodrum, New York, N. Y. App. filed June 29, 1916. Telephone.

1,250,856. ELECTRIC SOLDERING IRON; James T. Griffin, Oak Park, Ill. App. filed Jan. 3, 1916. Separable parts.

1,250,870. MAGNETO-DYNAMO UNIT; Otto Heins, New York, N. Y. App. filed Aug. 12, 1915. Improvements.

1,250,879. METHOD OF AND APPARATUS FOR FRACTIONATING HYDROCARBONS; Leon E. Hirt, Los Angeles, Cal. App. filed Oct. 21, 1916. Simple and highly effective manner.

The Urgent Need for Coal

COMMON experience throughout the eastern and central sections of the country with reference to the coal problem is such as to indicate that the solution of the task calls for large statesmanship in Washington. In all directions we are urged to curtail, even to check, industries, if necessary to save fuel. The disposition is to suppress. Every news item breathes of drastic measures. Nowhere is there a ray of hope for better conditions. We get promises, conferences and priority orders, but little relief. Notwithstanding the testimony of the soft-coal producers and the added assurances from miners themselves that the present coal shortage is inexcusable so far as they are concerned, no one apparently has taken steps to do what seems most vital—increase the production of coal to a point commensurate with present demands. It is admitted that the solution of the immediate problem rests primarily with the railroads. Given sufficient cars, the miners and operators promise to supply the coal. Under the government control, hundreds of passenger trains have been taken off to make room for freight movement, and with what result every traveling man and shipper knows. The congestion remains. The public will endure from the government what it would not tolerate for one moment from the railroad companies. Power to remedy conditions is not lacking—the government has it all; but we are still looking for the man with vision and foresight to apply that power—for the Moses who is to lead us out of this wilderness. Surely there are men big enough, patriotic enough and willing enough to take charge of the whole question of coal production, transportation and distribution and co-ordinate this work effectively. The task demands the best brains available and the country will not be satisfied with less. Action is also necessary. We have dallied too long with a serious situation.

The Close of the Eighth Crusade

ON Dec. 10 last the official entry of the British and allied forces into Jerusalem was witnessed by the inhabitants. The procession is stated by General Allenby to have been entirely on foot, after the manner appropriate to pilgrims at the gates of the tomb of Christ. Seven centuries have elapsed since the previous crusade, and this last, or eighth, crusade differs from all its predecessors by having had its base in Egypt. The desert of Sinai, which separates Palestine from the Nile delta, has been heretofore passable only to caravans or relatively small bodies of men, owing

to the difficulties of water supply and transport. But in this case it was conquered by engineering. A broad-gage railroad line was laid over the desert for a distance of some 250 kilometers, and an American pipe line is stated to have been installed to carry water from the Nile to the troops as they advanced. Scouting and reconnaissance were carried on by means of airplanes in radio communication with the advancing line. The eighth crusade succeeded not merely by valor and military skill, but also by the aid of engineering, with electricity taking its share.

Emergency Plants for France

THE coal crisis is world-wide and has already involved the mechanism of production to a serious extent. More than that, the labor required in mining and transportation is so very grave a matter in regions where man power is already short that the suggestions of Messrs. Clogher and Hammel in our current issue must be taken very seriously not only as regards France but in our own country as well. The situation in France is the more acute, but even here the quick development of considerable amounts of electric power is a step which should be taken at the earliest possible moment to help out in the present crisis.

France is in a specially bad way because coal has to be imported in large quantities under great difficulties, and its distribution puts added strain on transportation facilities already overtaxed in the conduct of the war. France has, however, a very large amount of water power, not generally in large blocks, but scattered rather widely over the central and eastern parts of the country, where it is within striking distance not only of industrial centers but even of the fighting front by modern methods of power transmission. There are a few great French projects like that for supplying Paris from the falls of the Rhone, but they are less quickly and easily developed than some of the minor ones. We need, too, in France liberal supplies of power for the necessary work back of our lines.

The suggestion of Messrs. Clogher and Hammel is an eminently workmanlike and sensible one. Experience in this country has taught that outdoor power stations and switching stations constitute now good conservative practice, and this is doubly true in the climate of France. Talk with a French or Swiss engineer of our extraordinary precautions against sleet, and he will stare at you open-eyed, wondering at the misfortunes which assail his American colleagues. Moreover, it is an indisputable fact that structures of elaborate and dignified architectural character are not in the

slightest degree necessary to house waterwheels and dynamo. They may prove impressive to the bondholder, but do not add to the effectiveness of the system. The proposition before us, therefore, is for the construction of hydroelectric units of as nearly standard type as practicable and their rapid installation, wherever feasible, to back up the industrial needs of the fighting fronts. There is nothing in the least impracticable about the idea.

The French government is probably in possession at the present moment of rather full details regarding a very considerable proportion of the water powers in France, including some of those whose development has already been studied. The efficient utilization of these would depend on the selection of such as make the least demands in the matter of time of constructing the hydraulic works, beginning operations at once, and concurrently starting production of hydroelectric units, transformers and line wires in this country. Much of the minor line material could undoubtedly be purchased in France, Switzerland or Italy more easily than it could be shipped from here. As is pointed out in the article, the delivery of the material does not make any great demand on tonnage and saves a large amount of continuous coal supply. Further, after the war is over, all these plants will prove serviceable in rebuilding the shattered industries of France, for which power will be sorely needed.

As regards the present power-plant requirement of the American army in France, we could well be undertaking it now by prompt co-operation of our own government with the French, and there are enough American engineers already on the ground to lay out and superintend the execution of the work. The distances to be covered are nothing serious from the American standpoint, and much of the construction would prove to be of permanent value. An obvious corollary of this proposition is that such plants should be thrust into service wherever possible in our own country. In this particular the lessons of the coal shortage may prove to be valuable ones. It is not often appreciated how much fuel hydroelectric plants save.

Power Requirements for Traveling Cranes

STILL another of Professor Clewell's excellent papers examines in considerable detail the special requirements of motor equipment for the traveling cranes in which it is so widely used. The electric crane needs no commendation here. It has become practically standard for all permanent work and for much temporary work. As its use has become more familiar the motor drive has been more and more refined. The things most imperative in its organization are unusual mechanical strength, accurate speed control and reliability. These have led to the development of many highly specialized devices, which Professor Clewell considers, and have resulted in apparatus which has proved exceedingly successful from every standpoint. One particular point in design to which attention should be directed is the question of efficient co-ordination between the speed and the requirements of the particular work for which the crane is designed. Here more than anywhere else is the finesse of the engineer needed in planning a successful crane equipment.

The New Bill Dealing with Water Power

A PROPOS of the dire need of increase in the development of electric power to meet our fuel difficulties, attention should be called to the administration bill concerned with this matter which will soon come before Congress. Its provisions are in no respect worse and in some respects better than those of several previous bills which have failed of passage. The present scheme provides for the institution of a federal power commission composed of the Secretaries of War, the Interior and Agriculture. To them will be given rather plenary authority over the public lands and navigable streams. The development of the bill follows somewhat the lines of those of the preceding Ferris and Shields bills. It differs from them somewhat in the disposition of the receipts obtained from power licenses, in that all these go to the Treasury of the United States, with provision for the proceeds being used in specified portions for the service of the national forests, public lands and navigable streams.

As respects the service and charges of the licensee companies, they are to be regulated in all interstate relations, and in states having no public commission charged with similar work directly by the federal water power commission. The states having commissions, of course, retain jurisdiction over the service and charges wholly within their own territory. The most important part of the bill, as of others, lies in the matter of charges and the regulations concerning the tenure of the privilege. Under the present proposal the license charges must be not less than 10 cents per horsepower per annum without any maximum fixed and for a period not exceeding fifty years. At the end of the license period the United States may take over the entire development upon a suitable payment therefor, or it may issue a new license either to the old or a new licensee on such terms as may then seem equitable. Now it is just at this point that the success of the bill may be made or broken. The expenditures put upon such a property in a license term of fifty years involve the building up of a business and interconnections probably of a very intricate kind, with other plants and powers both on the public domain and on private lands. It is not clear from the present proposals on what basis the government will be at liberty to take over part or the whole of the resulting business. The present provisions would include payment for severance damage, which seems to be a more reasonable provision than has heretofore appeared.

After all, the success of this or any other water-power bill in developing water powers must in the last resort depend on the temper and policy of the government regarding private property at the end of a long but somewhat indeterminate period. If the licenses hold for fifty years, there is reasonable opportunity for making financial provisions which will take care of this element of doubt. If a policy of relatively short-term licenses should be inaugurated, the financial side of the matter would be left hung up in the air. It would be better to assure licenses for a minimum period long enough to allow the enterprise to be properly and profitably developed, and there seems no good reason why the fifty-year term should not be regularly specified, considering the large powers which lie with the com-

mission in the way of regulating service and charges. The uncertain factors in any short-term development must necessarily be reflected in the price paid for power. The present bill provides a complete defence for the consumer, and therefore there would seem to be no reasonable excuse for shortening the term of the license, and there might be good reason for lengthening it. The chief need is to pass speedily the best available regulations, under our existing limitations of knowledge of the future, to encourage speedy development of all the available powers. We need them sorely, and every bit of delay adds to the gravity of the situation. A liberal policy toward the investor will hasten the construction of much needed works; an illiberal one which leaves his future in grave uncertainty will simply serve to cause further delay.

Inherent Voltage Regulation of Direct-Current Units

A DIRECT-CURRENT generator unit may consist of the electric generator and its prime mover, say a steam turbine. Such a unit, when supplied with steam of definite pressure and quality at the throttle, will deliver current at a rated voltage. If the throttle is left open and the field rheostat of the generator is untouched, the delivered voltage will vary in a definite manner as the load is applied to the generator. If the machine is a shunt generator, the voltage may be expected to fall very appreciably as the load comes on. This is partly due to the fall in speed of the prime mover, and partly due to the IR drop in the generator armature, as well as to the reduced generator-field excitation.

In numerous cases where the unit is supplied by one and the same manufacturer the total inherent voltage drop under load can be estimated in advance from previously acquired data concerning the prime mover and the generator; so that the specifications for inherent voltage regulation in the unit seldom produce difficulty when the unit is tested before delivery. When, however, one manufacturer supplies the prime mover and another manufacturer supplies the generator, there is an obvious opportunity for disagreement between the two and the purchaser in case the inherent voltage regulation of the unit does not come up to the limits stated in the specifications.

In the case of a compound-wound generator the difficulties involved are much less, partly because the inherent voltage regulation is much better than in a shunt machine and partly because the field excitation at constant speed may be almost independent of the load, so that the correction for change in driving speed may be much smaller and easier to determine.

This question of resolving the inherent regulation of a unit into the proper proportion assignable respec-

tively to the prime mover and to the generator is discussed this week in an article by W. B. Kouwenhoven. A simple technique and procedure are outlined for the case of a compound-wound generator. These call for the experimental determination of two characteristics of the unit—namely, voltage-load characteristic at constant steam pressure and the voltage-speed characteristic at no load and with adjusted steam pressure. From these two series of observations the voltage-load characteristic of the compound-wound generator for constant speed can ordinarily be inferred within satisfactory limits of precision.

The corresponding problem in relation to a shunt generator is much more complicated, as the article points out. In practice there is first the influence of change in speed on the delivered voltage at no load for constant field excitation. Second, there is the effect of change in temperature on the shunt-field circuit influencing the terminal voltage. Third, there is the effect of IR drop in the generator armature on the terminal voltage. Fourthly, there are the effect of change of voltage on the shunt-field excitation and its influence on the generated emf. The article offers no solution for this more difficult case. A solution has, however, been claimed by some engineers, although it is complicated and open to some uncertainty.

The Power Factor of Three-Phase Systems

THE power factor, or ratio of the active to the apparent power, in any single-phase alternating-current circuit considered as carrying substantially only the fundamental frequency is readily obtained from the readings of a voltmeter, ammeter and wattmeter connected to the circuit, or it may be obtained directly from the dial of a power-factor-indicating instrument joined to the circuit. In the case of a three-phase system, however, it is rare to find a power-factor indicator installed for the system, but the system power factor can be readily computed from the voltages on two sides of the system, the current strengths in two lines, and the readings of two wattmeters, one on each side. The computation is almost as easy for an unbalanced three-phase system as for a strictly balanced three-phase system.

E. G. Barrington develops this week a method for evaluating the power factor of a three-phase system when a polyphase wattmeter is employed. The method is shown to be applicable either to three-wire or four-wire three-phase systems. The method is evidently readily applied in the case of a balanced three-phase system. When the system is unbalanced modifications are described for making the necessary corrections, but the procedure takes considerably more time and is not as simple in application.

IN NEXT week's issue of the ELECTRICAL WORLD further attention will be given to the coal situation, which is of increasing seriousness and calls for the best thought and most careful management ever demanded by any exigency in the industry. The next installment of Professor Cléwell's article will contain a discussion of the motor and control

The Coming Issues

requirements for blowers, fan and air-compressor service. A rather technical article dwelling on the effect of color, thickness and temperature on the electrical properties of vulcanized fiber will also be presented on Jan. 26. Interest attaches to the results which will be given next week of somewhat unusual tests on electric range efficiencies.

Facing the Fact of Coal Shortage

Conditions of Supply Remain Very Serious for Central-Station Companies—
How They Have Worked to Get Coal Enough to Provide a
Reserve Supply—Cost High, Quality Poor

COAL supply conditions became increasingly serious as 1917 drew to a close; and in the opening month of the new year they are not only no better, they call for all the ingenuity of private and government agencies in order that the service of electric central stations may not be disrupted.

Contrary to precedent and cherished tradition of the central-station industry, service has been interrupted in many communities. To the extent that this is attributable to war needs and the urgent priority to which they are entitled, the industry has no ground for complaint; to the extent to which coal shortage is due to lax production methods or faulty distribution the industry passes criticism, not for the sake of complaining, but so that the conditions may be remedied as well as possible.

For a year the *ELECTRICAL WORLD* has consistently warned its readers of the dangers of coal shortage. It has advised forehandedness in accumulation of reserve supplies, has urged the study and introduction of economical boiler-room practices, has counseled quick and willing co-operation with efforts of the Fuel Administration to conserve power and coal. The object of the present article is to show how the companies operating steam stations using coal as fuel view the situation at present, what specific steps they have taken to lessen the strain of conditions, how they think improvement can be assured. The information published is based on a country-wide inquiry.

THE PROBLEMS OF COST, QUALITY AND SUPPLY

In general the companies have tried to meet these by furthering boiler-room efficiency, by looking more carefully into contracts for purchase of coal, by the purchase of mines in some cases and, so far as cost is concerned, by increasing rates for energy to large power users. In notable exceptions rates have not been increased.

An illustration of an analysis of boiler-room conditions which proved successful follows:

It was apparent during the latter part of 1916 that the demand for coal would be unusual, and in an endeavor to increase the general over-all efficiency of our production plants it was ascertained from a study of the log sheets that the greatest gain in economy would be in the boiler room. Previous to October the evaporation of one of our large boiler plants was averaging about the equivalent of 7 lb. (3.1 kg.), which gave a boiler efficiency in the neighborhood of 50 per cent. With this information we decided to make a thorough study of the boiler-room conditions and to conduct the necessary tests in order to ascertain the causes contributing to this lower efficiency. This study involved the handling of fires, draft conditions, gases, etc. We equipped all of our boilers with steam-flow meters and found that some boilers were carrying an average load of only 68 per cent of rating. This condition we found was caused by draft loss, settings, soot accumulation, etc. Capacity tests were run, and the best performance showed that only about rating could be got out of the boilers in the way they were operating and when they were entirely free from soot. These studies were conducted at a considerable expense, but we were able to increase the over-all efficiency of our plant by approximately 50 per cent.

We are not satisfied by any means that we have reached the maximum of the plant, but are continuing our studies from day to day, and the results justify a continuation of the expense involved. Coal clauses have been added to all large contracts and enforced.

Many companies installed coal-handling apparatus in order to be able to store even a greater reserve supply than under ordinary conditions, although subsequent events showed the impossibility of accumulating the amount of fuel desired. One company operating a relatively small plant spent \$5,000 on coal-handling apparatus.

One of the greatest difficulties, about which widespread complaint is made, lies in poor quality. Typical comments on this condition follow:

Owing to our inability to get our regular run of coal, we have to take all grades and kinds of coal; consequently our operating conditions are not at all satisfactory. Our economy has been poor, and it is impossible to adjust our fire-room conditions for a very fine slack coal and then in the next half-hour have lump coal.

The quality of coal which we ordinarily obtain averages

about 13,500 B.t.u., with about 9 per cent ash. Owing to the difficulty of obtaining an adequate amount of coal, we have been compelled to burn all kinds down to that running as low as 9600 B.t.u. and as high in ash as 34 per cent.

Where coal has been purchased on the market we have not found it possible to control the quality, which is wretched.

In anticipation of serious coal shortage many companies planned to store extraordinarily large reserve supplies, while others, as stated in previous issues of the *ELECTRICAL WORLD*, bought coal mines or an interest therein so as to strengthen their control at the source. Most of the companies found it impossible to store coal in adequate quantities. One company, for instance, reports having "only about 15 per cent of that stock ahead of us which would insure against a shutdown resulting from a long period of inclement weather with the consequent delay in freight movement."

Another company, in which complete shutdown had just been threatened, writes that the Fuel Administra-

ENFORCED ABANDONMENT OF THE HISTORIC PRACTICE

Publication of this survey of the coal situation coincides with the most acute crisis, due to coal shortage, in electric central-station history.

The practice of storing adequate reserve supplies of coal to guard against the danger of mine or railroad strike or interruption of operation from any other cause has grown with the years. Its wisdom, tested time and again, has given the public continued service in past years. A less forehanded policy would have been followed by curtailed service or complete cessation of operation, with the result of public inconvenience and distress.

It is greatly to be regretted that events have prevented the companies from carrying out their time-honored, justified policy of maintaining adequate storage piles at generating stations.

When normal times are here again this policy will be re-established more firmly than ever. It is a necessary and effective safeguard.

tion has thought it wise, in effect, "to clear out our stock piles and put us on a hand-to-mouth basis, thereby wiping out our own plans and provisions for the winter."

The purchase of an interest in a coal mine gave one company sufficient coal to take care of requirements, although car shortage brought anxiety several times. However, there has been a considerable advance in the cost of coal to this company.

"Considering the expense other companies are having on account of the high price of coal," says this company, "we are of the opinion that the purchase of our interest in the mine has materially assisted us in this trouble."

A holding company which followed the policy of buying coal mines where the consumption of coal by the operating utility warranted it says: "We have been able to mine this coal at a considerably lower figure than the price fixed by the administration."

Experiences on the question of price vary widely be-

cause of the radical differences in coal-producing conditions and costs in the country. Increased cost, however, is the burden of the complaint. Comment on this point follows:

We formerly paid 85 cents per ton for coal at the mines, but we are now paying the government price of \$2.85, plus 15 per cent for brokerage, with a possibility of paying 45 cents in addition if the miners get the increase for which they are asking.

I had occasion to collect some information with reference to effect on operating conditions, and my recollection is that before the present prices were established by the government the average increase in coal cost of the various companies with which I corresponded was about 145 per cent and the average increase in the operating cost was about 45 per cent.

Are buying coal at the market price, which is about 300 per cent more than it was two years ago.

We were fortunate enough to have made a contract for two years' supply of coal and have received the bulk of our coal under this contract, although we were forced to cancel it so far as price was concerned and pay practically the government price.

RAISING RATES TO MEET INCREASED COST OF FUEL

Many companies have raised rates to offset in part the increased cost of fuel, or plan to take this step. Some have not raised rates and do not expect to do so. One executive writes:

"We feel it a part of our patriotic duty not to raise our rates unless absolutely necessary. The new wholesale contracts that we have made carry a coal clause. These clauses, however, barely pay for the increased cost of coal, without considering other items."

The attitude of companies generally in trying to protect themselves by increasing rates is shown by the following statements:

The problems raised by increased cost of coal during 1917 came upon us so quickly that it was impossible to provide adequate additional revenue against them in time to have much effect upon the earnings for 1917. We have done something in the way of securing increased wholesale power rates, but not on all of our properties and have been able to do very little except get started in other directions.

We are endeavoring to meet, although it has not yet been accomplished, the increased costs of coal due to bonus which we have been obliged to pay in order to get the necessary supply, although under contract until 1921, by increasing rates. If we can obtain sufficient increases to offset the increased costs, we are perfectly satisfied. At this writing this has not been accomplished, and probably will not be accomplished for another sixty days.

Surcharges on power and steam-heating rates will yield approximately 45 per cent of our increased coal cost.

[A continuation of this article, to be published next week, will deal with other vital phases of the critical coal situation.]

Japan's Electrical Industries

The Department of Communications of Japan has published the following statement of the condition of the electrical industry in that country at the end of July, 1917: Plants supplying energy, 568 companies with \$160,796,063 capital; electric railways, forty-two companies, \$21,706,985 capital; engaged in both branches, forty-eight companies, \$148,482,339 capital. Compared with the figures for the corresponding period last year there is an increase in the number of enterprises of thirty-five, with an aggregate capital of \$17,892,057.

A Solution for an Acceptance-Test Problem

Simple Method of Correcting Generator-Unit Load-Characteristic Curve for Variations in Speed—Of Entire Accuracy When the Magnetic Circuit Is Highly Saturated

BY W. B. KOUWENHOVEN

Associate in Electrical Engineering, Johns Hopkins University

SYNOPSIS.—From experimental results the conclusion is drawn that there is no simple method for correcting the generator-unit characteristics of shunt generators for variations in speed unless the iron is highly saturated. In the case of compound generators the results show that there is a simple method for correcting the generator-unit characteristic for variations in speed. This method gives the true load characteristic of the generator within a plus and minus variation of about 1 per cent for ordinary machines. This method may also be used to determine a generator-unit load characteristic from the true generator characteristic of a given generator when that generator is combined with a prime mover whose speed variation with load is known.

AS THE load on a prime mover increases its speed falls so that the resulting regulation of a generator connected thereto is not the true generator regulation but a combination of the speed regulation of the prime mover and the voltage regulation of the generator. A question therefore arises sometimes when the generator and prime mover are purchased from different concerns whether the generator gives the regulation called for in the specifications* or some other value.

Such a case having been brought to the writer's attention, he undertook the problem of determining from the load characteristics of the generator unit the true load characteristics of the generator. The load characteristics of shunt and compound generators were studied both theoretically and experimentally. The ex-

FIG. 1—CHARACTERISTICS OF GENERATOR CORRECTED FOR SPEED VARIATIONS

The lower curve is the load characteristic belonging to a generator unit. The figures 1100, 1080, etc., refer to the speed of the set at which the readings were taken. The upper full-line curve is the true generator-load characteristic taken at a constant speed of 1100 r.p.m. The broken-line curve shows the characteristic that is obtained when the generator-unit characteristic is corrected according to the ratio $(n_1/n_2)^2$ and the dotted-line curve is the characteristic that is obtained when the generator-unit characteristic is corrected proportional to the ratio n_1/n_2 . It is evident that the true characteristic of the generator lies between these two corrected curves, and that neither of the above speed corrections gives a method by which the true characteristic or regulation can be determined from the generator unit characteristic or regulation.

perimental work was performed in the laboratories of the electrical department of Johns Hopkins University.

THEORETICAL ANALYSIS OF REGULATION

At rated speed and no load the emf. induced in a direct-current generator is given by the relation

$$E = k_1 n \Phi,$$

where E is the induced electromotive force, n the revolutions per minute, Φ the flux per pole and k_1 a constant whose value depends upon the number of armature con-

FIGS. 2 AND 3—LOAD CHARACTERISTICS OF TWO COMPOUND GENERATORS, THE LATTER CORRECTED FOR SPEED

ductors connected in series, the number of poles and numerical constants.

Since the flux per pole is proportional to the mmf. divided by the reluctance, and the mmf. depends upon the number of ampere turns that there are in the field circuit, $\Phi = k_2 (i_f/R)$, where i_f is the field current in amperes, R the reluctance and k_2 a constant. Substituting the value of Φ in the equation for the induced voltage, $E = Cn(i_f/R)$, where C is a new constant which equals the product of k_1 and k_2 .

The field current i_f is found by dividing the terminal voltage by the resistance of the shunt-field circuit. But at no load the terminal and induced voltages are practically equal and therefore the field current is directly proportional to the induced voltage E . Assuming there is no load on the generator and that at n_1 revolutions per minute the induced voltage is E_1 , then at a lower speed of n_2 revolutions the induced voltage E_2 would be less by the ratio n_1/n_2 , provided the field current was maintained constant. But in an actual machine, where the resistance of the shunt-field circuit is constant, the drop to E_2 volts would cause a proportional drop in the field current i_f . If the flux were directly proportional to i_f , the value of E_2 would be expected to be less than E_1 by the ratio of $(n_1/n_2)^2$.

However, the flux is not proportional to the field current because the reluctance of the iron is not constant. The reluctance decreases as the flux decreases, and the flux does not decrease as rapidly as the field current decreases. Therefore, the resultant change in induced voltage for a fall of speed to n_2 revolutions will

*A. I. E. E. Standardization Rules, Article 571.

be less than that given by the ratio $(n_1/n_2)^2$ and greater than that given by the ratio n_1/n_2 (see Fig. 1).

No simple method was found for correcting shunt generator characteristics for variations in speed unless the flux saturation of the iron was high (see Fig. 2). At high values of the saturation it was found possible to correct† the generator-unit characteristic-load characteristic by adding to it an ordinate that was equal to the drop in voltage between the no-load voltage at rated speed and the no-load voltage at the lower speed for which the correction was desired.

In securing the data for Fig. 2 the shunt excitation only was used, and load curves were taken for 200, 141 and 100-volt values of no-load voltage. The resulting characteristics are the curves A, B and C. The speed was maintained constant at rated speed throughout each run. Then, in order to investigate the effect of a change in speed, another set of curves was taken. In this second set the voltage was adjusted to the corresponding no-load voltage at rated speed, i. e., 200 volts; the speed was allowed to drop 10 per cent to 1080 r.p.m., and a new characteristic was found during which the speed was held constant at 1080 r.p.m. The corresponding characteristics are given by the A', B' and C' curves respectively.

Compound-generator characteristics were also studied graphically, using Arnold's methods. The analysis indicated that the method of adding to the generator-unit characteristic an ordinate which is equal to the difference in voltage between the no-load voltage at rated speed and the no-load voltage at the lower speed for which the correction is to be made will give good results and is furthermore simple in application. In order to test the correctness of this theoretical conclusion a number of compound generators were tested. As in the case of the shunt generator, load characteristics were taken at different speeds, the resistance of the field circuit remaining unchanged throughout. These points determined by the graphical method were found to lie almost entirely upon the true characteristic curves of the generators, their maximum plus and minus deviation being less than 1 per cent.

The success obtained with this method of correcting for speed variations led to a further study of other compound generators. In all of these tests the true load characteristic of the generator was obtained at constant rated speed. Then a load characteristic of the generator unit was obtained. In each case the set started at rated speed and the terminal voltage was measured as the load was applied, the speed being allowed to fall in accordance with the inherent speed characteristics of the prime mover. The load was removed and then at no load and rated voltage, or at the voltage for which the true-load characteristic was determined, a third curve, which will be called the no-load-voltage-speed characteristic, was taken by simply allowing the speed of the prime mover to drop and noting the armature voltage for various values of speed. The resistance of the field circuit was maintained constant throughout the entire run. The load characteristic of the generator unit was then corrected for speed variations by adding to it a correction obtained from the no-load-voltage-speed characteristic for the given reading (Fig. 3).

The calculated load characteristics checked very closely with the true generator load characteristics and indicated that the correction is independent of the saturation and speed at which the characteristics are desired over a considerable range.

APPLICATION OF THE METHOD

A method of actually securing the data necessary for determining the regulation is as follows: Starting at no load, rated voltage and rated speed, take the necessary data for plotting the load characteristic of the generator unit, noting the speed at which each reading is taken. Remove the load and, starting again at rated voltage and rated speed, throttle the prime mover and reduce the speed throughout the same range of speed as was found when determining the load characteristic,

FIG. 4—MEASURED AND CORRECTED CHARACTERISTICS OF SHUNT GENERATOR, SHOWING AGREEMENT AT HIGH SATURATION

noting the no-load voltage at various values of the speed. Plot the generator-unit characteristic, marking at each point the corresponding speed and the no-load voltage-speed characteristic of the unit.

For a given point on the generator-unit characteristic determine the correction as follows: From the no-load voltage speed curve determine the difference in volts between the voltage at rated speed and the voltage at the speed corresponding to the given point. Add this difference to the ordinate of the generator-unit characteristic at

the given point and the corrected point will lie on the true generator characteristic curve of the machine.

Proceed in a similar manner to correct the other points on the generator-unit characteristic. Draw the curve through the corrected points and the result will be the true generator load characteristic. From this curve the true regulation of the generator can be found.

Not only can the true load characteristic of the generator be obtained from the generator-unit characteristic by this method, but it may also be applied in the reverse direction and the generator-unit characteristic determined from the true load characteristic of the generator. If the load characteristic at constant speed and the voltage-speed characteristic of a given generator are known, it is possible to predetermine, by the use of this method, the load characteristic that will be obtained when the generator is combined with a prime mover whose speed variation with load is known. In such a case the proper ordinate for a given drop in speed below rated speed is determined from the voltage-speed characteristic curve, and this ordinate is subtracted from the true load characteristic of the generator. The resulting curve is the load characteristic curve of the prime mover and generator combined.

Obtaining Power Factor by Use of Wattmeter

Explanation of the Manner in Which, by Making Simple Change in Connections of Polyphase Wattmeter, Power Factor on Three-Phase Circuits May Be Readily Obtained

BY E. G. BARRINGTON

Toronto Hydroelectric Commission

ALTHOUGH several methods have been proposed for obtaining the power factor on three-phase circuits, most of them prove to be incorrect when the phases are unbalanced, which is usually the case to a greater or less extent on all commercial circuits. By means of the following method the power factor of any

OA is equal to R'/E' and OB equal to R''/E'' . If, however, E' and E'' are equal, R' and R'' are proportional to these values and may be substituted for OA and OB in the above formula.

Referring to Fig. 2, in which the voltages of a three-phase system are represented by A , B and C and the currents by a , b and c , the current in the three lines will be ab , bc and ca . The currents ab and bc are considered as flowing through elements R and L of a polyphase wattmeter, in which case voltage A will be connected to element R and voltage C to element L .

By reversing voltages C and B (in which case they will be represented by C_r and B_r) and connecting them, instead of voltages A and C , to elements R and L respectively, a reading proportional to the components of currents ab and bc in phase with voltages lagging 60 deg. behind voltages A and C will be obtained. From this reading it is possible to find the total reactive volt-amperes and the tangent of the angle of phase difference by means of the preceding formula. This reading will be positive for any value of this angle between 30 deg. lead and 90 deg. lag.

For values between 30 deg. lead and 90 deg. lead it will be necessary to use the voltages B_r and A_r in order that the angle between the voltages may remain 60 deg. and so the same formula may apply. These voltages may also be used for any angle between 30 deg. lead and 30 deg. lag, making the total range with the lagging voltages from 30 deg. lag to 90 deg. lag, and with the leading voltages 30 deg. lag to 90 deg. lead. In the ma-

FIGS. 1 AND 2—VECTORIAL RELATIONS EMPLOYED IN DEVELOPING METHOD OF OBTAINING POWER FACTOR BY WATTMETER

three-phase circuit, three-wire or four-wire, on which the voltages are balanced may be obtained from the indications of a polyphase wattmeter when a simple change is made in the connections of the potential coils. It may also be used when the voltages are unbalanced, but in this case it is necessary to take additional readings, as will be explained later.

DEMONSTRATION OF THEORY

The principle upon which this method is based may be demonstrated as follows: Let I and E' (Fig. 1) represent the voltage and current of an alternating-current circuit in which I lags behind E' by the angle ϕ . The reactive component of I may be obtained if the component of I in phase with E' and also another voltage of known phase difference from E' is known. Let E'' represent a voltage θ degrees behind E' . Then OA and OB are the components of I in phase with E' and E'' respectively, and AD is the reactive component. Draw BC perpendicular to E'' to meet E' at C .

Then $OC = OB/\cos \theta$.

$OB/\cos \theta - OA = AC$.

But $AC \tan (90 - \theta) = AD$.

Therefore $[(OB/\cos \theta) - OA] \tan (90 - \theta) = \text{reactive component of } I$.

$$\text{And } \tan \phi = \frac{[(OB/\cos \theta) - OA] \tan (90 - \theta)}{OA}$$

The components OA and OB may be obtained from the readings of a wattmeter to which the current I is connected and the voltages E' and E'' are applied in turn. Calling the first reading R' and the second R'' ,

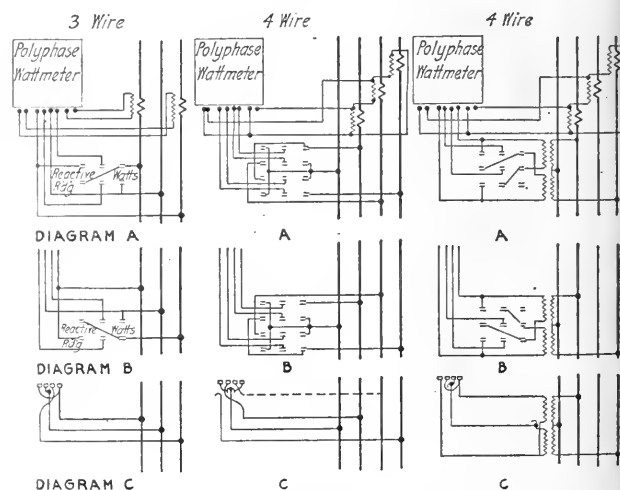

FIG. 3—CONNECTIONS NECESSARY FOR MAKING READINGS

jority of cases at least the power factor of a given circuit does not vary over these limits. However, if this is not the case, an additional double-throw switch will enable either set of voltages to be connected to the meter.

By means of this change in connections the two values required for the formula are obtained, the angle θ being

60 deg. The formula may now be written in a much simpler form, thus:

$$\frac{[(R''/\cos 60) - R'] \tan 30}{R'} = \frac{2R'' - R'}{\sqrt{3}k}$$

CONNECTIONS NECESSARY FOR MAKING READINGS

The connections which will give the required voltages under different conditions are as shown in the accompanying diagrams (Fig. 3), which give the connections for both leading and lagging voltages. It is impossible to tell which will result in leading voltages and which in lagging voltages, as this depends on the direction of phase rotation, which is not generally known. The correct one may easily be found, however, by trying out each connection and using the one that gives a positive reading, or the highest positive reading if both are positive, which will be the case if the power factor is above 87.7 per cent.

FIG. 4—VALUE OF POWER FACTOR FOR DIFFERENT VALUES OF R' AND R''

As a check on the connections it may be noted that a decrease in the power factor will cause a decreased reading on the meter with a given load in watts. Also, that at 100 per cent power factor the reactive meter will read 50 per cent of the reading of the wattmeter. At other power factors the ratio will be as follows:

Power Factor, per Cent	Ratio Watts to Reactive Reading
87.7	1:1
50	1:2

In case both connections give a positive reading, one reading will, when applied to the formula, result in a negative angle, thus indicating that leading voltages are being used with a lagging current or vice versa. By means of the accompanying chart (Fig. 4) the power factor may be read without the use of the formula. The scales R' and R'' in the chart may, of course, be changed to correspond with the scale of the meter. In case the chart is used with a leading power factor it is necessary to interchange the two words "lead" and "lag."

A useful and easily remembered method of temporarily changing the connections of a three-wire meter is shown in diagram C of Fig. 3. This change is most easily made at the meter terminals as follows: Disconnect the line wire on one element and the common wire on the other element; connect the disconnected line wire

of the one element to free terminal of the other; connect the two line terminals together, the position of the voltages obtained with reference to the original voltages depending upon which element the line wire is disconnected from. The connection for four-wire meters cannot usually be so readily changed, since for meters operating at line voltage it is necessary to carry an additional wire from the meter to the line, while with transformer meters the two transformers are usually connected to a common line. In this case it is necessary to open this connection. The required changes are, however, shown in the diagrams.

MODIFICATIONS NECESSARY WHEN VOLTAGES ARE UNBALANCED

While the formula in its simpler form is strictly correct only when the voltages are balanced, the amount of unbalance usually found on commercial circuits is not enough to affect seriously the result. The errors introduced may, however, if necessary, be corrected; but inasmuch as the value and phase difference of the voltages on each element will not be equal under these conditions, it is necessary to treat each element separately as follows:

With the potential circuit of one element open and a voltmeter connected across the potential terminals of the other, take readings on the wattmeter and voltmeter with the meter connected for both watts and reactive reading; then change over to the other element and take readings as before. Call the wattmeter readings V' and V'' . It will be found that two of the four voltmeter readings obtained will be equal since they have been taken on the same phase. By constructing a triangle with sides proportional to these values the angles between any two voltages may be measured. The value of the reactive volt-amperes for each element may then be found from the following formula:

$$\tan (90 - \theta) \left[\frac{R'' \times V'}{V'' \cos \theta} - R' \right],$$

θ being the angle between the voltages V' and V'' .

For four-wire meters operating at line voltage the formula is as follows:

$$0.577 \left[\frac{2R'' \times V'}{V''} - R' \right].$$

The algebraic sum of the reactive volt-amperes obtained for each element divided by the total watts will give the tangent of the angle of lead or lag.

Pacific Coast Company to Use Sawmill Waste for Fuel

Announcement has just been made in San Francisco that the Northwestern Electric Company of Portland, Ore., has contracted for construction of a 15,000-hp. steam generating station which will use sawmill refuse for fuel. This refuse consists of bark, splinters, short ends, slabs and sawdust, etc., which the lumber trade terms "hog fuel," and which has a very low value at the mill. It is understood that recent development of shipbuilding activity in Portland has created an increased power demand which is taxing the capacity of the system to the limit. The use of the new fuel will be a war measure in coal and oil conservation at the same time that it is expected to prove very economical.

Helping France to Help Herself

Hydroelectric Power Can Supplant Her Coal Supply Better than It Can Be Done by More Ships, and American Emergency Construction Can Provide Such Plants in from Six to Nine Months

BY ALEXANDER C. CLOGHER AND VICTOR F. HAMMEL

The object of the electric organization of the army is to distribute light and motive power as near as possible to the firing line by applying the established methods of the industry. Electric lighting of a general nature is the thing which next to nourishment contributes the most to maintain the morale of the men. Moreover, the use of electrical energy in the territory occupied by the armies increases the product of manual labor in multiple forms, a consideration not negligible in a war of attrition such as that we are waging.—Capt. Gustave P. Capart of the French Army, *ELECTRICAL WORLD*, Nov. 3, 1917.

EVERY man that we send to France, whether for the firing line or behind it, will necessitate the manufacture of additional electric power for min-

istering to his needs and comforts. The shops for repairing our rifles and guns will probably be larger than most of the munition plants in this country. These shops must be run by electric power. Most of the electricity generated in France is derived from coal. As France has no coal to spare, we must either make use of some of our ships for transporting our fuel for producing this power or obtain the power from other sources.

Electricity is produced from two sources, viz., fuel, either coal or oil, and water power. France

has no oil, an inadequate supply of coal but a large amount of undeveloped water power, a latent force which should be utilized for supplying the mechanical power so necessary in the prosecution of modern warfare.

It is well known that there is a great scarcity of coal in France, but it is probably not generally realized that a large part of the coal which is available from the French mines must be used for the manufacture of electric power for the use of the army, navy, munition

industries and, lastly, for the absolute necessities of commercial life. These demands on the scant fuel supply have raised the price of coal to a point where it is practically out of the question to use it for heating dwellings. This lack of heat has caused a great deal of suffering among the French people, and any measures which might be taken to relieve our ships from the duty of transporting fuel for our fighting forces could also be utilized to relieve the coal famine in that country.

The only practicable method remaining for relieving the coal shortage in France, other than providing more ships for the transportation of coal and oil, is to utilize some of the undeveloped water power now going to

waste in that country. It is possible for the United States to render signal aid to France in the development of this power, because of the large amount of capital required.

Conservatism has prevented the most progressive development in the use of electricity in the countries of Europe, just as it has held it back in the northeastern part of the United States. In this country we have our most complete and economical electric systems for the generation, transmission and distribution of electric power in the West and the South. Here we

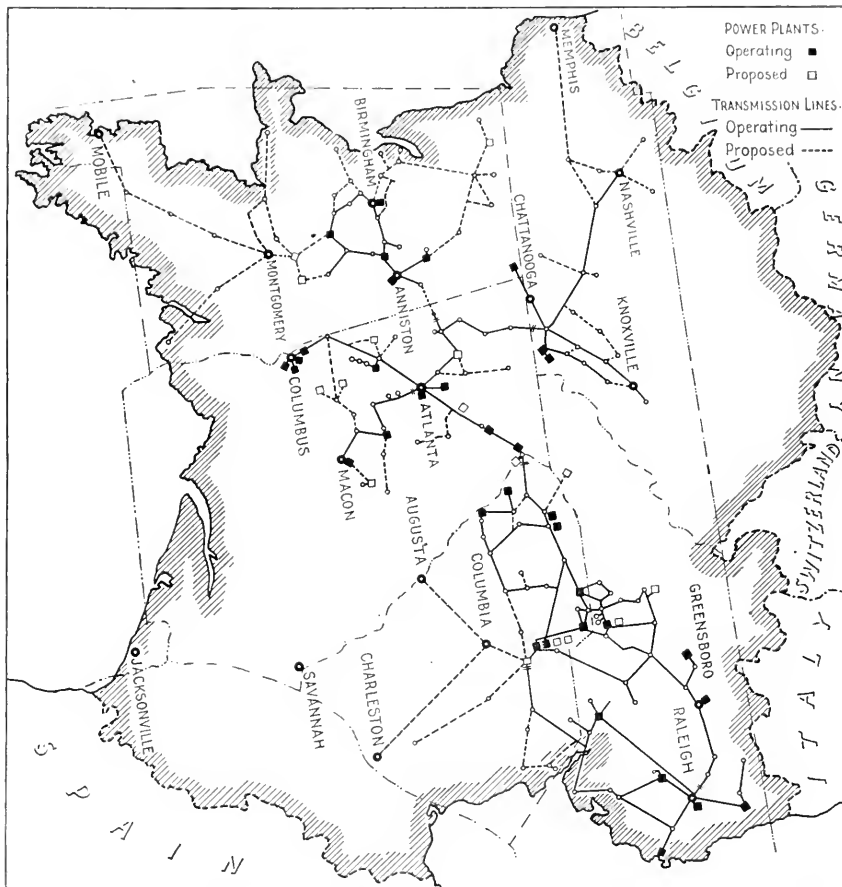

FIG. 1—INTERCONNECTED TRANSMISSION SYSTEMS OF THE SOUTH SUPERIMPOSED UPON THE MAP OF FRANCE

find a number of public utility companies serving territories as large as Switzerland from an interconnected transmission system. These companies generate, most economically, practically all of the power used by their respective communities in a few modern steam plants or in a number of hydroelectric plants.

Although there are many excellent examples of modern hydroelectric developments in France and Switzerland, it is probable that American engineers could more clearly see the potentialities for the complete develop-

ment and use of all of the hydroelectric resources in those countries. American practice proves that it would be possible to develop all of the available water power on a range of mountains in France and to distribute it throughout several provinces, whereas present developments in that country generally consist of the power available on a stream distributed to a few nearby towns and villages.

THE PROBLEM OF SHIPS

It would be unfortunate if our government did not awaken to the possibilities of this idea, which to the authors seem to be as effective a method for relieving the shipping shortage as the construction of more ships. The same amount of money would be required to build two 5000-ton steel vessels as would be required to build a 10,000-hp. hydroelectric or steam-electric power plant in France. Two such ships could easily

but for 100,000 hp., and it would release, not two ships, but twenty or more large-sized freight-carrying vessels.

If there were undeveloped power sites near our army base, the simplest solution of the army power problem would be for it to lease or purchase these power sites, develop whatever hydroelectric power it might need for its own use, and in this way avoid the necessity of using ships for transporting coal for steam-power plants which might otherwise have to be built.

LONG TRANSMISSION LINES

The topography of France, however, does not lend itself to so simple a solution of the problem. Most of the available water-power sites are situated in the extreme eastern and southern parts of France, and those nearest to our army's operations are of the type which require the longest time for construction. At first

FIG. 2—PLANTS OF THIS TYPE OF FROM 1000 HP. TO 15,000 HP. CAPACITY WILL HELP SOLVE THE COAL PROBLEM IN FRANCE AND RELEASE COAL-CARRYING SHIPS FOR OTHER SERVICE

transport all of the material required for construction in either case. On completion, the steam plant would require the continuous service of both vessels for supplying it with coal, in addition to the men and transportation facilities required in this country for mining and delivering the coal to the seaboard. The hydroelectric plant, when completed, would require the services of fewer than half a dozen men. This is indeed true conservation of man power and of natural mineral resources. It could be done not only for 10,000 hp.,

glance the transmission of water power from the Alps and Pyrenees for our army base seems out of the question because of the distance. When one considers, however, that coal in France is worth \$60 to \$70 per ton, the transmission of hydroelectric power 400 miles or even 500 miles (650 km. to 800 km.) might not only be economical but it might be desirable in any event in our conduct of the war, if it would make more ships available for transporting other supplies.

The solution of the problem might be an indirect one,

and our army might secure its coal by releasing the coal now used for producing commercial power in western France. We might provide hydroelectric developments for supplying this commercial power.

In localities where all of the available hydroelectric power is developed in small independent units there is certain to be an excessive waste of energy. It is impossible to make the demand for power from each

FIG. 3—A 10,500-HP. HYDROELECTRIC UNIT IS HOUSED HERE; THE ROOF ROLLS ASIDE SO THAT THE ELECTRIC CRANE OVERHEAD CAN LIFT THE HEAVY MACHINERY

small market conform to the supply of water available at its respective small power plant or plants. Some plants have large storage available which can be used to make the output uniform from a large number of plants which may have a great variation and no storage. One of our public utilities in the Rocky Mountains, using the power generated on about twenty-five streams, is able to provide a uniform production of power even in the driest year, on account of the large amount of storage it has on one stream only. This company's plants and customers are scattered over a territory larger than Switzerland, and 70 per cent of its production is transmitted 140 miles (225 km.) to its market.

GOVERNMENT AID NECESSARY

If it would be possible to secure from the French government rights which would insure the quick possession of the undeveloped water-power sites in France, efficient plants might be constructed and completed just as quickly as steam-power plants which the American Expeditionary Force would have to erect in order to carry on its operations.

Such development would require a tremendous outlay of money and could not be undertaken privately without a government subsidy. It might be accomplished by a federal corporation similar to our Emergency Ship Corporation. Such an undertaking would of necessity move slowly, and undoubtedly the greatest success (because the quickest) could be attained by making the project one of the auxiliary operations of our army.

Under the conditions it would appear that the most effective way to expedite victory over the enemy would be the emergency construction of water-power plants. It is not a question of conservation but the urgent need of the moment that should determine the action to be taken.

American practice is particularly well adapted to emergency construction. A great deal of our hydroelectric development has been done in the rough, mountain-

ous and sparsely settled country west of the Mississippi Valley, where the power was desired quickly for mining purposes, or for some town or city far from the power site. Consequently, methods of expediency were used which have been impossible in older and more settled communities.

EXAMPLES OF AMERICAN ENGINEERING GENIUS

The American engineer has often been told to secure results quickly and to expend the minimum amount of money. He often made mistakes, which many plants in existence to-day attest, but he has developed designs and types of construction which will admit of the quickest possible construction. To realize what has been accomplished one need only review our Western developments, with their successful outdoor equipment and elimination of large power houses. Comparatively, these are simplified structures, and incidentally enormous strides have been made in the time required for construction.

To illustrate the adaptation of such construction to emergency development, note the sketch of a 7500-hp. one-unit installation. This general idea could be used for a very wide range of water-power sites of from 1 hp. to 15,000 hp. in size. In this type of development the water is diverted by a small, low dam and conducted along the stream bank in a wooden pipe or flume, or in a concrete-lined canal. All the equipment is of simple character, which could be manufactured and assembled in America and set up in France, and be in operation in less than sixty days after its receipt at the site. The concrete work is of the simplest nature, and could be completed before the arrival of the machinery.

The gantry crane and the small steel building run on separate tracks, and both can be erected off to one side before the foundations are completed. It should be noted that with such a scheme no time is required to build a massive power house before the erection of the vital machinery can commence. The average American

FIG. 4—AN ATTENDANTLESS 2000-HP. STATION AT WHICH NOTHING IS INSIDE THE BUILDING EXCEPT THE WATERWHEEL AND GENERATOR

layman, and even many engineers, when thinking of power stations have in mind the esthetic structures seen on the large rivers in the Eastern States and the expensive steam plants in our large cities, all of them large structures and imitating in various degrees the architecture of almost every conceivable type of monumental building, from prisons to libraries.

European engineers are more prone to build such

monuments. In their densely populated countries they have always been required to erect imposing structures with infinite devotion to detail, that the developments might harmonize with the surroundings. After the war the emergency plants could be reconstructed and imposing superstructures might be erected over them to cover them up. It is questionable, however, if this could ever be done once the custom of placing this type of machinery outdoors were established.

Such a station could be operated individually or by tying in by transmission lines with a number of similar plants. Ten of these small single-unit plants connected together with transmission lines would give more reliable service than one large station containing ten generating units. A development of this type would be made to deliver power surely within a period of six months from the day of inception and selection of the

imperatively necessary that the consideration of the full use of the water power of the country and also the consideration of the systematic and yet economical development of such of the natural resources of the country as are still under the control of the federal government should be resumed and affirmatively and constructively dealt with at the earliest possible moment. The pressing need of such legislation is daily becoming more obvious."

Making Reports for the Income Tax

Income-tax experts are to be sent to every county seat and other cities and towns to meet the people and explain the provisions of the new federal income-tax law. Returns must be made by March 1. The government recognizes that many persons will have a good

FIG. 5—NO BUILDINGS ARE REQUIRED FOR MODERN 130,000-VOLT ELECTRICAL EQUIPMENT

power site. Hydraulic-equipment manufacturers in America have wonderful facilities, which are not being utilized to the best advantage because of the lack of this kind of construction.

It is hoped that we shall not be dilatory in grasping this wonderful opportunity to help France. Had Switzerland started developing extensively her abundant water power at the beginning of the war she would not have been forced to tie herself, perhaps irrevocably, to German control. Recently she was forced into very unfavorable trade agreements in return for coal that she could not obtain elsewhere.

America has tarried too long over conservation policies at home. Cognizance of this has been taken by President Wilson, and has called forth this admirable warning to Congress in his address of Dec. 4: "It is

deal of difficulty in filling out income-tax forms and that taxpayers resident at points where collectors' offices are not easily accessible find it hard to get proper instruction in the law.

Every married person living with wife or husband and having a net income of \$2,000 or more, and every unmarried person not the head of a family and having a net income of \$1,000 or more, for the year 1917, must make a return of income on the form prescribed by the law. Very many people assume that if an income-tax form is not sent or a government officer does not call, they are relieved from making a report. This is decidedly an error. The taxpayer has to go to the government, and if he doesn't go within the time prescribed he is a violator of the law and the government will go to him with its penalties.

Joliet Plant a Step Toward Higher Steam Pressures

Features of Boilers, Piping and Economizers in New Joliet Plant of Northern Illinois Company, with Arrangements for Handling Coal and Supplying Feed Water

COMPLETION of the first unit of the newest power house of the Public Service Company of Northern Illinois, situated near Joliet, Ill., marks another distinct step in the advance in power-plant engineering. A pressure of 325 lb. (22.8 kg. per sq. cm.) will be developed in the boilers at the Joliet station, and pressures around 300 lb. (21.1 kg.) will be used in the turbines. One 10,000-kw. (12,500-kva.), 12,000-volt machine is already in operation and another of the same size is being erected. This high-pressure practice, of course, makes possible a higher over-all plant efficiency by increasing the upper limits of the thermal cycle. Just what the exact extent of the gain in efficiency will be on account of adopting this practice will not be definitely known until the plant has been run under operating conditions.

The station was built on a carefully chosen site, on which it can be extended in unit sections to an ultimate rating of 60,000 kw. or more. While it is very far from the geographical center of the territory served, it is in reality very near to the electrical-load center of the present system. Moreover, the present tendency of industrial growth seems to indicate a more rapid development between Chicago and Joliet than south and west of the latter city. An adequate supply of good water and fuel is available, the former from the Desplaines River, which is constantly fed from Lake

Michigan, while coal can be received from Illinois and Indiana over either of two trunk-line railroads.

The general arrangement of the apparatus in the plant is not radically different from that in other modern stations. The boiler room, turbine room and switch house are all on one level. The present installation of two 10,000-kw. horizontal generators and the probable future installation of two larger similar machines are laid out in a single line end to end. The three boilers are arranged in the usual fashion along both sides of a firing aisle. The electrical installation is practically that which is standard for supplying 12,000-volt energy for industries near the station and 33,000-volt energy for transmission.

SOME OF THE FEATURES OF THE PLANT

Although the boilers are of the standard B. & W. cross-drum type, they are built to withstand higher than the usual pressures. The plates in the boiler drum are 15 16 in. (3.33 cm.) thick, the longitudinal seam being a butt and double-cover strap quadruple-riveted joint. The heads are secured by two rows of rivets. Tubes of No. 7 gage as compared to No. 10 for 200-lb. (14.1-kg.) pressure are used. All high-pressure steam piping is extra heavy and of relatively small diameter owing to the density of the steam. The length of straight runs has been limited, and numerous long-

radius bends are employed to provide for expansion. All fittings are of steel, the manifolds used in connection with the boiler leads having been cast and the smaller fittings forged. On pipes above 4 in. (10.2 cm.) diameter a special bolted joint with a welded seal at the periphery is used.

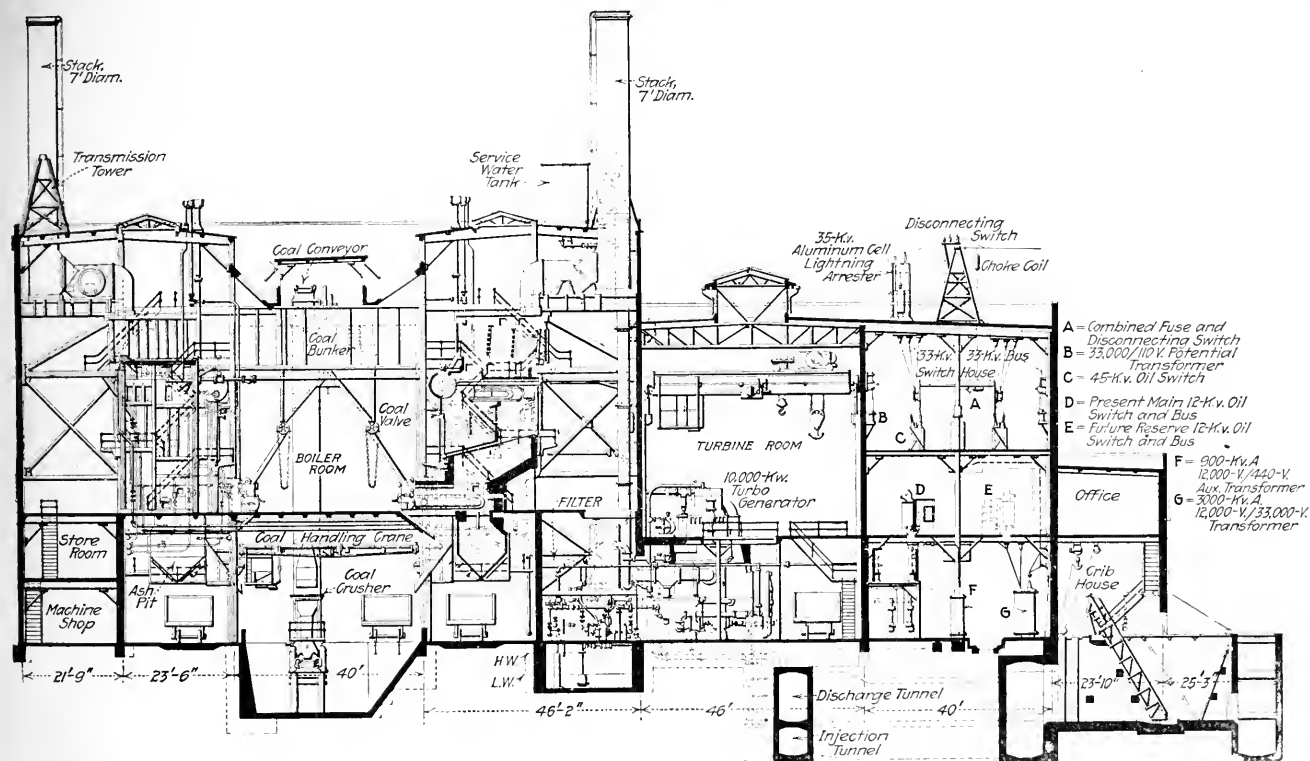

A notable feature of the steam equipment is the individual all-steel horizontal-tube economizers, the first of their kind in this country. Each economizer is placed above and integral with the boiler, with no dampers between, so that the gases pass directly from one to the other. The economizer is really a part or stage of the boiler. Furnace gases pass from the economizer at such low temperatures as to permit unlined steel stacks.

Another feature of the plant is a basement entirely above ground, the main operating floor being the second story of the building. This construction was employed as the plant is in an old stone quarry, which would have made excavation costly. Moreover, the construction gives head room for coal and ash cars to operate at the ground level and eliminates ash-handling equipment. There is gravity flow for the coal from the overhead coal bunker to the stokers and for the ashes from the stokers to the railway car waiting to receive ashes directly from the hoppers under the stokers.

Outside of stoker engines held as reserves for motor drives, there is no reciprocating machinery in the station. All pumps are of the motor-driven centrifugal

two cross-drum water-tube boilers, each having 9919 sq. ft. (970.8 sq. m.) of steam-making surface, a built-in superheater with 3100 sq. ft. (288 sq. m.) and an economizer containing 6730 sq. ft. (625 sq. m.) of surface. There are now three boilers in the plant, but when the second generating unit is installed another boiler will be added. With a good grade of Illinois coal it is the intention to use three boilers to carry the two generating units, leaving one boiler in reserve. Under this arrangement there will be 1.49 sq. ft. (0.1386 sq. m.) of active steam-making surface per kilowatt of generating capacity, or on the basis of 10 sq. ft. (0.92 sq. m.) 1 boiler-hp. will serve 7.67 kw. This does not take into account the economizer, which is really the first stage of the boiler. Each boiler, with its steel casing, masonry setting and retreating back, covers at the floor line an area of 294 sq. ft. (27.3 sq. m.), or 0.296 sq. ft. (0.022 sq. m.) per horsepower (10 sq. ft.) of rating. Including the overhang and the space occupied by the stokers, the floor space covered is 585 sq. ft. (54.3 sq. m.), or 0.59 sq. ft. (0.055 sq. m.) per horsepower. From the boiler-room floor to the top of the economizer the height is 42 ft. (12.8 m.).

Two chain grates are placed side by side in a common furnace, each being 8 ft. (2.4 m.) wide, 14.5 ft. (4.4 m.) long and containing 116 sq. ft. (35.15 m.) of active grate area. The ratio of the total grate area to the steam-making surface is one to forty-three. The stokers are motor-driven through reduction gears and belts,

RELATIVE POSITIONS OF PLANT APPARATUS AND ARRANGEMENTS FOR DISPOSING OF ASHES AT GROUND LEVEL

type with the exception of the boiler feed and one service pump operated by turbines. Provision is made to bleed steam if desirable under thermostatic control from the fourth stage of the main turbine. Another innovation is to utilize the condenser for drawing boiler make-up from the fresh water reservoir. The water enters the condenser and is passed to the heater in the usual way by the condensate pump.

For each 10,000-kw. generating unit there will be

with vertical engines in reserve. The general design of the setting and the positions of the economizer and induced-draft motor-driven fan are shown in the plan. Rising 65 ft. (19.8 m.) above the fan or 125 ft. (38.1 m.) above the grate is an individual self-supporting steel stack 7 ft. (2.13 m.) in diameter. Owing to the low temperature of the flue gases leaving the economizer (350 deg. Fahr.) the stack is unlined. The inner surface is lined with a heavy asphaltic paint.

Being the first of its kind in this country, the economizer is of special interest. The construction is similar to that of a B. & W. boiler, except that no drums are used. The headers are of wrought steel and the tubes are 4 in. (10.2 cm.) in diameter, $\frac{1}{4}$ in. (0.63 cm.) thick and 16 ft. (4.8 m.) long, of drawn steel. As low temperatures are expected, the tubes are galvanized inside and out to guard against corrosion. The economizer is vertically baffled for three passes, the gases from the boiler entering at the front and from the third pass rising vertically through the induced-draft fan to the stack. The fan has capacity to handle 75,000 cu. ft. (2100 cu. m.) per minute of gas at 350 deg. Fahr. At this rating the power required is 94 hp.

To give plenty of reserve capacity for contingencies and to reduce upkeep to a minimum, a 150-hp. motor was installed. In general, this policy of using large motors for the work has been adopted throughout the station.

Water to the economizer enters at the bottom of the rear header and passes through 396 tubes, leaving at the top of the front header. The relative flow of gas and water is thus counter-current.

Further information regarding the details of construction required by increased steam pressure, as well as features of the electrical part of the station, will be presented in a subsequent issue of the ELECTRICAL WORLD.

Motors and Control for Traveling Cranes

Types of Electrical Equipment Found Suitable with Different Cranes, Current Demand During Typical Operations, and Factors in the Effective Handling of Cranes

BY C. E. CLEWELL

Assistant Professor of Electrical Engineering, University of Pennsylvania

SYNOPSIS.—This article, the eleventh of a series on motor and control applications, contains a discussion of the suitability of variable-speed motors for traveling cranes. Reference is made to the various types of cranes in use, the types of motors commonly employed, the current required by the various motors under operating conditions, and the type of control for such equipment. In connection with control, various methods of braking are explained and a series of simplified wiring diagrams is used to show the typical schemes of connections for hoisting and lowering the load where dynamic braking is included in the control equipment. Reference is also made to the importance of the gearing between the driving motor and the crane bridge itself as a factor in the effective handling of the crane, and to the use of limit switches as a safety factor in hoisting.

THE term "traveling crane" includes several types, as follows: (a) The standard electric overhead traveling crane, where the crane travels upon an overhead framework or structure. In this type three

motors are usually required, one of which operates the hoisting device, a second moves the crane as a whole along the runway up and down the factory aisle, and a third moves the "trolley" back and forth along the crane girders. The hoisting equipment is mounted on the "trolley." (b) Gantry cranes, which are similar in general characteristics to (a), but where the crane is operated on tracks at floor level, the crane itself being supported on structural legs. (c) The usual equipment employed in telferage systems. (d) The jib crane, where a motor is used for driving the hoisting tackle. (e) Electric locomotive cranes, in which a number of motors may be used for driving the various elements. (f) Miscellaneous types, such as charging cranes, skip hoists and the like.

In this article the standard electric overhead traveling crane of class (a) has been selected as the basis of the discussion. As far as the motor is concerned

FIG. 1—ELECTRICALLY OPERATED YARD CRANES UNLOADING CASTINGS

or the three elements of the overhead traveling crane the straight series direct-current type is the one usually employed.¹ The speed-load characteristics of the series motor are such that under heavy loads the motor operates at a reduced speed, which is desirable from the standpoint of the supply circuits and generating equipment, while at reduced loads the motor operates at

of an overhead traveling crane when handling a 30-ton load² are shown in Figs. 5 to 8. These curves relate to one set of conditions only, but they indicate clearly the variations in the current requirements, and, moreover, they show that the demands on the various crane motors are likely to vary over wide limits except in those special cases where a fairly well-defined duty

FIGS. 2 AND 3—BRIDGE, TROLLEY AND HOIST MOTORS ON TWO TYPICAL CRANE INSTALLATIONS

higher speeds and the quick handling of the crane is thus facilitated under such conditions.

Where alternating current only is available it is sometimes satisfactory to use alternating-current motors of the slip-ring induction type, which are preferable as to torque and speed variation in comparison with the squirrel-cage induction motor. Neither of these alternating-current motors, however, has such a marked tendency to higher speeds at light loads as the series direct-current motor, and hence it may be desirable in those cases which require wide speed variation to convert from alternating current to direct current, so as to make possible the use of direct-current series motors (see footnote 1). Fig. 3 gives a good idea of one type of (inclosed) direct-current crane motor, while Fig. 10 shows the use of polyphase alternating-current motors for crane service.

Several features in the motors for cranes have received special attention. In the general class of inclosed direct-current motor shown in Fig. 3, for example, rugged construction is apparent. Reliability under the exceedingly severe operating conditions encountered has been secured by careful design of the bearings, so as to insure large and well-oiled bearing surfaces; the frame has been designed for unusual strength; the commutator and brush surface has been made large enough to meet the service conditions; the armature coils are heavily banded and in some motors the overhung portions of the armature coils are supported on shelves; and finally the use of commutating poles, which increase the life of the commutator and contribute to the ease of using the motor for reversing service permits handling sudden overloads without sparking. Similar care has been given to the design of alternating-current motors of the various types.

Graphic ammeter records taken on the three motors

cycle is repeated regularly, and possibly also in those cases where a crane is used only occasionally for repair work, as in a power house, where the heating of the motors is sometimes a problem of little or no importance.

Where the duty cycle is subject to fairly close determination the "square-root-of-mean-square" method for ascertaining the correct motor horsepower rating may be used, as fully explained in previous articles. One method employed by the manufacturers is to rate crane motors in brake horsepower on a basis of being able to operate continuously for thirty minutes, starting cold, at the full rated load without any part of the motor rising to any higher temperature than 55 deg. C. above the temperature of the surrounding air. A knowledge of the r.m.s. horsepower required, together with the manufacturer's rating basis, makes it possible to select the motor, whereas in those cases where the duty cycle is not well defined and where the maximum or full capacity of the crane is required at infrequent intervals it becomes more difficult to apply a definite method for the horsepower determination, and a greater degree of judgment must be exercised.

Care must be taken in the application of series motors to see that the maximum speed reached by the motor at light loads is not greater than the construction of the motor armature can stand. Some manufacturers, therefore, tabulate the maximum speeds for the various classes of series-wound crane motors, which must not be exceeded when the motors are carrying the friction load of the crane only. For example, the motors in Fig. 3 are listed at 2100 r.p.m. for this maximum speed, whereas low speed is listed as 550 to 600 r.p.m. and

¹The classification of cranes is based on an article by A. C. Eastwood, "Standard Handbook for Electrical Engineers," fourth edition, McGraw-Hill Book Company, New York.

²Figs. 2 and 3 are reproduced from C. W. Hill's treatise on cranes. Figs. 5 to 8 are due to the General Electric Company, Fig. 10 to the Wagner Electric Manufacturing Company, and Fig. 11 to the Crocker-Wheeler Company. Frequent references have been made to the "Standard Handbook for Electrical Engineers" and to bulletins or other data placed at the disposal of the writer by the Westinghouse Electric & Manufacturing Company and the other companies just mentioned.

moderate speed at 725 r.p.m. for this same type of motor.

A simplified wiring diagram showing the principal elements of a direct-current crane controller is shown in Fig. 4. In hoisting, the operation of this controller

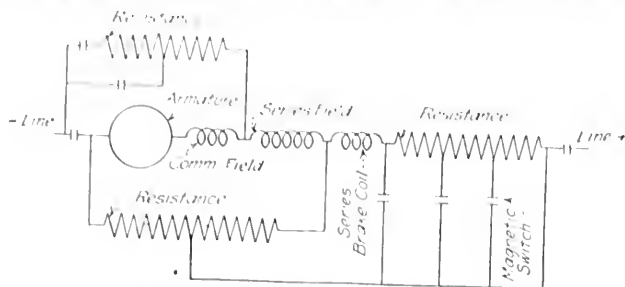

FIG. 4—SIMPLIFIED DIAGRAM OF DIRECT-CURRENT CRANE CONTROLLER

is similar to that of ordinary controllers, since the motor is merely connected to the line through armature resistance, as shown in the upper part of Fig. 9, for example, in which case the upper left-hand resistance is inserted for the purpose of starting up the motor at low speed. In lowering the load of a crane-hoist motor it is necessary to employ some means for braking the load. This may be done by an ordinary mechanical brake, by some form of electrically operated brake or by dynamic braking. The last two types are of interest from the motor or electrical control standpoint.

It is usually the practice to arrange electric brakes so that they exert their braking effect only when no current is being supplied to the motor from the line. As soon as the controller admits current to the motor the brake is released. Of the three types of electric brakes commonly employed (band, disk and shoe) it is the usual practice to furnish the disk brake when the brake is required merely for retarding the momentum of the moving parts, and it is constructed to hold, say, one-half of the full-load torque of the motors. For high retarding power the shoe brake is desirable, and it may be adjusted to hold more or less than full-load torque.

Dynamic braking is especially interesting because it involves some modifications in the controller. Consider, for example, the controller represented by Fig. 4. When the load is lowered the first position of the controller places the armature and the series fields across the supply mains through paths which are in parallel, each path having resistance, as in the third simplified diagram of Fig. 9. An inspection of this diagram shows that these connections place the armature and field winding in parallel, thus essentially making the machine a shunt motor for the time and starting the load at low speed. This first controller position for lowering is sometimes called the "kick-off" position.

As the load is lowered the armature is rotated and the motor is thus converted into a generator, which results in a "dynamic" braking current through the series field tending to stop the motor. By advancing the controller additional resistance may be inserted in the armature circuit, thus increasing the speed of lowering (see the lowest diagram in Fig. 9). Other types of controllers are available, but they differ chiefly in details and in some of the functions they are designed to cover.

THE CROSS BRIDGE DRIVE*

While the normal speeds of crane bridges vary considerably, depending on conditions, from 250 ft. to 300 ft. (76.2 m.) per minute, which correspond to about 3 miles to 3½ miles (5.6 km.) per hour, are practical averages based on the speed at which a man can walk down a factory aisle while accompanying a piece of material being transported by the crane. Where very long runs are involved higher gearing is sometimes employed, resulting in speeds as high or even higher than 1000 ft. (304.8 m.) per minute.

A. C. Eastwood (see footnote 1) cites an interesting case where a bridge speed of 500 ft. (152.4 m.) per minute was employed for a certain crane, which performed a regular duty cycle made up of short moves of about 24 in. (0.6 m.) at a time for twenty-four successive times, after which the crane returned to its

FIGS. 5, 6, 7 AND 8—AMMETER RECORDS FOR AN ACTUAL CRANE WHEN LIFTING, LOWERING, CARRYING LOAD (30 TONS) BACK AND FORTH ACROSS BRIDGE, AND TRANSPORTING ALONG CRANEWAY

When set it is self-adjusting in that any wear in the brake shoes is compensated for in such a way that the air gaps and hence the braking strength are kept constant. The disk brake, however, has an advantage over the other two types in that side strains are equalized as regards the shaft, and, moreover, the effectiveness of the braking does not depend on the direction of rotation, as may be the case with the other two types.

starting position. This cycle of operations continued for essentially twenty-four hours each day. After this crane was placed in operation it proved to be unsatisfactory because the operator found it almost impossible to stop at the required point, practically always going beyond and then finding it necessary to reverse and

*"Standard Handbook for Electrical Engineers," fourth edition, p. 1212.

going beyond in the reverse direction. This made several attempts necessary in each case to place the crane in the desired position. To reduce the gear ratio between the bridge motor and the driving shaft would tend to reduce the difficulty of stopping at a fixed point,

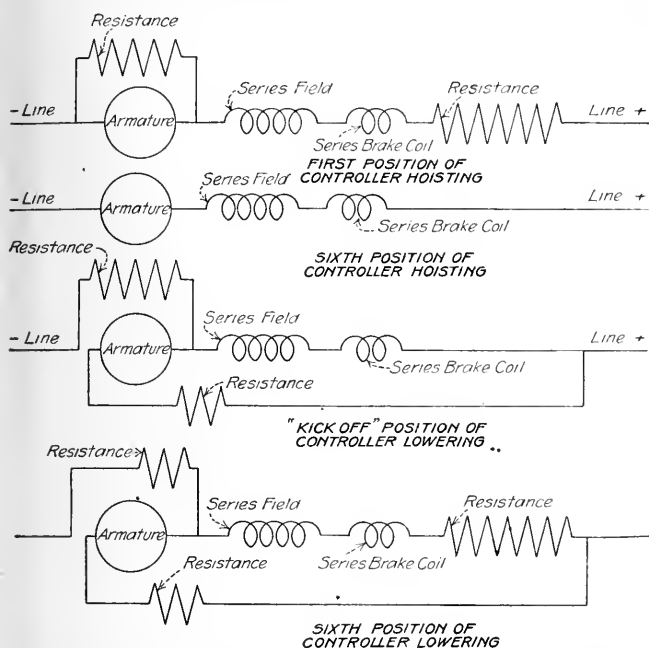

FIG. 9—CHANGES MADE IN CONNECTIONS WITH DIFFERENT POSITIONS OF CONTROLLERS

but theoretically such a reduction would also tend to lower production because of the reduced speed at which the bridge could be moved along the aisle of the workshop.

Nevertheless, the gear ratio was changed so that the reduction was three times as great as the original reduction, with the result that because of the increased accuracy in stopping at fixed points, the production or the output of the crane was increased over 400 per cent in spite of the decreased speed at which the bridge could be moved. This interesting case brings out in the form of a single example the need for careful attention to the gearing problem in crane operation as one of the features in the application of motors to such drives.

Special devices are available as protective features. One of these is the hoisting limit stop or switch,

FIG. 10—ANOTHER TYPE OF DRIVE FOR TROLLEY AND HOIST

with which it is made impossible to raise a load by the hoisting motor so as to force it up into the trolley mechanism. One scheme for operating such limit switches is to have them cut off the supply current automatically when the hoisting tackle reaches a certain point and then to insert a dynamic brake circuit of such

low resistance that the motor and load are stopped practically at the instant of disconnection.

Panels are also equipped to protect against overloads and prevent injury to workmen making repairs due to the starting of the motors before work is completed.

In conclusion it should be stated that the economies

MOTOR CONNECTIONS FOR DIFFERENT SERVICES WITH FOUR TYPES OF MAGNET-SWITCH CONTROL

which were shown to be possible when correct applications of motors and control are made to lathes and planers are almost equally possible with the traveling crane because of its importance to production in the handling of materials.

Book Reviews

HOW TO MAKE HIGH-PRESSURE TRANSFORMERS. Second edition. By Prof. F. E. Austin, Hanover, N. H. 46 pages, 211 illustrations. Price, 65 cents.

Several methods of making different types of transformers for high-voltage use are given in this book in simple language. Information is given on the method of procedure for designing and constructing transformers for any special use and on formulas for the calculation of various losses, thus insuring a suitable design.

BUSINESS LAW FOR ENGINEERS. By C. Frank Allen. New York: McGraw-Hill Book Company, Inc. 291 pages. Price, \$3.

It was said recently before a large body of men by a speaker of some prominence that every successful business man must be something of a lawyer. Probably of no profession is this more true than that of engineering. The author of this volume, a professor of railroad engineering in one of the most prominent technical institutions in the United States, an engineer of wide experience, a member of the Massachusetts bar and a former practicing lawyer of considerable repute with engineering corporations, has undertaken after years of preparation to give the engineer, as he expresses it, "a sufficient understanding of important fundamental features of law so that he may have some idea of when or how to act himself and when to seek expert advice." The book, which is in two parts, (1) elements of law for engineers and (2) contract letting, seems very complete and goes well into detail without, however, being full of legal technicality. The layman can easily grasp its contents.

STATION & OPERATING PRACTICE

A Department Devoted to Problems of Installation, Operation and Maintenance of Equipment for Economical Generation and Distribution of Electrical Energy

ALLOWABLE LINE LOSS DEPENDENT ON SERVICE

Consideration of Kelvin's Law May Indicate Necessity of Smaller Line Loss Where Energy Is Purchased at Primary Rate

BY R. G. HARRIS

In working out sizes of transmission-line conductors the rule of "10 per cent allowable for line losses" has become so well established that power company engineers sometimes forget that it may not apply when figuring transmission lines for consumers. Although 10 per cent may be satisfactory for the company's lines, where the actual cost of producing energy at the switch-board is something under $\frac{1}{2}$ cent, it is another matter altogether if the energy is being transmitted by the purchaser, who has paid about $\frac{3}{4}$ cent per kilowatt-hour for it at a high voltage and has to figure in line allowances as well as mechanical efficiencies in his operating charges.

The use of Kelvin's law—namely, that the annual value of the power lost should theoretically equal the annual cost of the copper in the line—as an aid to judgment in finally determining the economic size of wire will very materially change the assumption as to line loss, and the 10 per cent assumption under the conditions mentioned above will generally be found to be very excessive.

PYROMETER SYSTEM FOR ANNEALING FURNACES.

Mounting of Thermocouples, Method of Running Circuits and Provisions for Supervision of Furnace Operation

BY W. P. THOMAS

An indicating and recording pyrometer system that is giving complete satisfaction to both the furnace operator and the metallurgist was installed some time ago by the writer in connection with a battery of six annealing and hardening furnaces. Six indicating pyrometers with the auxiliary equipment are installed on the checkers' bench; the recording pyrometers are situated in the metallurgist's laboratory and signaling lamps are mounted over each furnace to notify the attendant when the temperatures of the furnace are high, low or correct. Three thermocouples are installed in each furnace so that the central and end temperatures can be observed, and so the operator can determine which fuel valve to operate to keep the temperature correct. To avoid the use of too many pyrometers and still not hinder the observation of temperatures, the thermocouples are connected in groups of six to three circular switches, which in turn are connected with double-pole, double-throw switches, as shown in the accompanying illustrations, so that readings may be checked.

A small hole is provided in each furnace where the

temperature is desired and the thermocouple centrally attached to a tripod the feet of which rest upon the top of the furnace. What might be called a stuffing box is provided to seal the space between the thermocouple and the furnace casing, the construction, (c) in the accompanying illustration, being such that the thermocouple can be raised or lowered by adjusting the tripod attachment. This arrangement also makes it easy to remove the thermocouples for renewal or inspection. To prevent the leads of the thermocouples carbonizing, owing to heat escaping through the holes in the top of the furnace, long enough thermocouples are used so that their upper ends can be bent at an angle of 90 deg., bringing the cold ends 1 ft. (0.3 m.) from the

middle of the furnace, where the circuits run into conduits leading to the checker's bench and metallurgist's office.

All of the wires, which have asbestos insulation, are installed in iron conduit. The checker's bench being centrally situated, a 2-in. (5-cm.) conduit was installed from it to a pull box placed between the third and fourth furnaces. From this point to the second and fifth furnaces $1\frac{1}{2}$ -in. (3.8-cm.) conduit is used and reduced to 1 in. (2.54 cm.) where it extends to the first and sixth furnaces. From the main conduit $\frac{3}{4}$ -in. (1.9-cm.) conduit extends above the furnaces to points over the thermocouples, where $\frac{3}{4}$ -in. (1.9-cm.) conduit tees equipped with porcelain bushings are provided. One-and-one-half-inch (3.8-cm.) conduit is used between the checker's bench and the metallurgist's laboratory.

AUTOMATICALLY OPERATED SYNCHRONIZING STATION

Arrangements by Which Two Transmission Lines
May Be Automatically Connected at a Point
Remote from Any Station or Substation

The Iowa Railway & Light Company of Cedar Rapids has two 13,200-volt transmission lines which it is desirable to operate in parallel, yet which join each other at a point where it is frequently desirable to open the circuit. Moreover, it is not desirable to interrupt service on either line to bring about the paralleling of the two sections after the line has been opened. A sub-

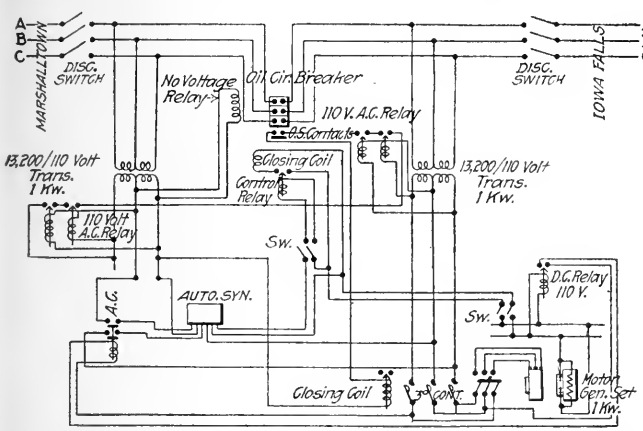

DIAGRAM OF CONNECTIONS IN AN AUTOMATIC SYNCHRONIZING STATION BETWEEN TWO HIGH-TENSION LINES

station simply for the purpose of connecting the lines together at this point did not seem to be justified. To meet this condition, therefore, the company's engineers have installed an automatic synchronizing station and a set of watt-hour meters, equipped with ratchets, to record the interchange of power between the two sections of the system.

The apparatus consists of two sets of 13,200/110-volt, 1-kw. standard transformers, two sets of 110-volt steel-mill type relays, an automatic synchronizing device, a 1-kw. motor-generator set, an oil circuit breaker and a few additional relays. The two sets of 110-volt steel-mill-type relays are connected across the phases of the secondary sides of the transformers, which are in turn connected in the 13,200-volt circuits. The contacts on these relays are in series, therefore the closing of all relays is accomplished when all phases are energized. When all of these series contacts are closed the small motor-generator set is started. It supplies energy through its direct-current unit, when it comes up to full voltage, to close the direct-current relay shown in the accompanying illustration. This in turn permits alternating-current energy to flow to the synchroscope.

The synchroscope, manufactured by the Westinghouse Electric & Manufacturing Company, consists essentially of two solenoids acting on cores hung on the opposite ends of a rocker arm. The solenoids are connected so that the right-hand end of the rocker is at the extreme lower end of the stroke when the electromotive forces to be synchronized have no phase difference and is at the upper end of the stroke when the phases are in opposition. This causes the rocker arm to oscillate up and down. When the right-hand end of the rocker arm approaches the lower end of its motion with less than a predetermined speed the contact closes the circuit

of an auxiliary relay, which in turn closes the circuit operating the closing coil of the main oil switch. The closing of the contact occurs before synchronism by a predetermined length of time sufficient to permit the main switch to complete the circuit exactly at the point of synchronism. The synchronizer does not make contact at all unless the difference in speed of the two machines at the different ends of the line is less than a predetermined amount.

The contacts in the synchronizer at the oil switch are closed when the oil switch is open, and vice versa, to permit starting and stopping of the motor-generator set as desired. For protection against single-phase operation the no-voltage release coil is connected to all phases. The oil switch is not arranged for tripping on overload, the lines being protected at other points against difficulty from this source. The action of the alternating-current relay, which is operated by the motor-generator set, is analogous to the action of an operator before a switchboard plugging in a synchronizing receptacle.

This apparatus, together with the metering equipment, is installed out in the middle of a cornfield and takes care of itself entirely, except for a visit from an attendant about once every three months. The installation was worked out for the Iowa Railway & Light Company by John M. Drabelle, the company's electrical engineer.

OUTFIT DESIGNED FOR TAKING CONTINUOUS FLUE-GAS SAMPLES

Bonus Paid to Operators on CO₂ Present Is Determined by Use of Device That Collects Gas Over an Entire Eight-Hour Shift

After having tried a number of methods of determining the percentage of CO₂ in flue gases at its plant, the Bloomington & Normal Railway & Light Company of Bloomington, Ill., has developed the apparatus shown herewith. The company has installed an outfit of this character on each boiler in its plant. This apparatus in operation takes a continuous sample of the flue gas for eight hours after it is started. The plant is operated on eight-hour shifts, and at the end of each shift the gas is sampled in an Orsat set for CO₂, and occasionally for O and CO. The record of the result is made:

DETAIL DRAWING OF FLUE-GAS SAMPLING APPARATUS

on the power-plant report, and also on a bulletin board in the boiler room, to show the comparative record of each boiler and each fireman for the different shifts.

The water pipe used for filling the tank is near the bottom of the barrel so that water while filling the barrel shall not disturb the oil seal which is used over the water. When using an oil seal the CO₂ is generally 1 per cent higher than without it, because the oil prevents the escape of air and other gases which are in the

water into the boiler-gas sample under slight vacuum. All samples taken by this apparatus are tested by an efficiency man, the samples being received from the tank in 4-in. (10.2-cm.) gas stopper bags such as are used in stopping gas mains. The time required for filling the tank with water is three minutes, and about three minutes is required to run a sample through the Orsat machine.

The outfit installed in the company's plant has been in operation for some time with good results. The principal difficulty with an arrangement of this kind is in keeping the pipe lines free from a deposit of fine ash which is likely to clog them. The bonus which the boiler-room operators are paid on CO₂ in combustion gases averages about 12 per cent.

FIREPROOFING TOWER LEGS TO SAFEGUARD SERVICE

**Legs Are Incased with Concrete to a Height of 40 Ft.
Above the Ground—Description of
Method of Reinforcing**

At the Margaret Street substation of the Springfield (Mass.) street railway a steel tower has been built to hold one end of a 66,000-volt transmission span across the Connecticut River, over which the Turners Falls Power & Electric Company is to supply energy to the railway system. A special feature of this tower is the fireproofing of the legs to a horizontal cross-section of 12 in. by 16 in. (30.5 cm. by 40.6 cm.), illustrated herewith.

The tower legs are of structural steel and are each incased with concrete to a height of about 40 ft. (20.2 m.) above the ground, thus clearing the maximum vertical range likely under any circumstances to be reached

TOWER LEG INCASED IN CONCRETE

by arcs or hot gases in case of oil-switch trouble at the substation adjacent to the tower. The concrete is reinforced with a loop of wire mesh surrounding the lattice work of the tower leg in each case. An outdoor substation equipment with transformers and switches occupies the area below the tower, which requires heavy bracing to serve as the span anchorage, as shown.

MECHANICAL SOOT BLOWERS MAKE 15 PER CENT SAVING

**Installation in an Iowa Plant Makes the Jobs of
Firemen More Pleasant and Enables Them
to Keep the Boilers Cleaner**

After one year's experience with mechanical soot blowers, Charles W. Smith, chief engineer for the Iowa Falls (Iowa) Electric Company, has reached the conclusion that the devices have proved themselves a good investment. The installation consists of three sets of Bayer type B cleaners on one 550-hp. and two 410-hp. Edge Moor water-tube four-pass boilers. Before these cleaners were installed the company was using the old hand-cleaning method. This method was expensive and unsatisfactory, costing \$840 a year. Practically all of one man's time was required, and it was found that there were few men who would stand in front of a hot boiler and blow every tube. Some tubes would be skipped, with the result that the boilers were never all clean. In fact, it was practically impossible for a man to hold a steam lance with full 175 lb. per sq. in. (12.3 kg. per sq. cm.) pressure on the line. After the new cleaners were installed it took two months to get the caked soot off the tubes which had grown there owing to the use of wet low-pressure steam before the mechanical cleaning system was used.

Several points in favor of the mechanical cleaning have been apparent. The main feature is that in blowing the soot it is possible to use full boiler pressure and do better work. With the old system the tubes were blown once every twenty-four hours. Now they are blown twice on every shift, and, moreover, the services of one man have been entirely dispensed with, thus making him available for other work.

Mr. Smith stated that these cleaners had effected a 15 per cent reduction in coal burned and had occasioned no maintenance expense. One pint (0.5 l.) of oil has been used on the swinging joints. Thus far the valve seats have not required grinding.

USE OF INSULATORS TO PHASE 66,000-VOLT LINE

**A Novel Method of Finding if Proper Phase Relation
Existed in Locality Where Potential Trans-
formers Could Not Be Employed**

A novel method of phasing out a 60,000-volt line was employed by the Southern California Edison Company recently when it became necessary to join the ends of an open loop. Potential transformers could not be used because the phasing-out point was remote from any station or instrument equipment. Suspension insulators were therefore employed, as explained in the following paragraph.

Three strings of five units each were hung on the wires of one end of the loop in such a manner that the lower ends of the strings could be swung against the three wires of the other end of the loop. One string would draw a spark about $\frac{1}{4}$ in. (6.2 mm.) long while the other two drew sparks more than 1 in. (25.4 mm.) long, showing that they were out of phase with their corresponding wires. These two wires were reversed and the loop closed through the pole top switch without disturbance.

CENTRAL STATION SERVICE

A Department Devoted to Commercial Policy and Management
Topics, Including Applications of Electric
Light, Power and Heat

INCREASING BUSINESS ON SMALL-POWER MACHINES

Through Co-operation with Local Manufacturers'
Agents Considerable Load Has Been Placed
on Southern Company's Lines

The commercial department of the Birmingham Railway, Light & Power Company has been giving considerable attention recently to the development of small power business. A careful analysis was made of the market to determine which appliances offered the best advantages, and the campaign started, concentrating on these selected appliances.

The Birmingham company does not sell electrical appliances, and it was therefore necessary to secure the co-operation of the local agents in the district handling the various appliances. These agents were naturally enthusiastic over the plan and have taken hold and sold more small power devices than have ever been placed on circuit in that community before.

A large number of vacuum cleaners have been sold and a great many washing machines, vulcanizers, special shoe machines, refrigerating machines, dough mixers, etc. Coffee mills, meat grinders and peanut-butter makers have also been very strong, twenty-six peanut-butter machines having been sold in the last four months on extra meters, with all energy billed at the lighting rate. A short campaign on washing machines was also very successful, six washers having been disposed of in one day in spite of the fact that Southern cities have not yet broken from the negro washer-woman habit and taken to the modern method.

The result for the company has been most profitable and satisfactory. The active co-operation of the manufacturers' agents has reduced the company's responsibility and work to the minimum and at the same time organized an extensive selling force of expert men who have proved most effective.

POWER MEN TURNED TO ON SMALL APPLIANCES

In Certain of the Doherty Properties Sales Forces
Are Thereby Kept Intact at a Profit
to the Companies

Conditions in these war times are bringing about some interesting changes in the work of many central-station selling men. Not only is there trouble in securing fuel, but many companies after waiting months for new generating equipment have had to relinquish it to the government and see no possibility of increasing their capacity. The result has been that frequently power salesmen have had to discontinue the development of industrial business from the sheer impossibility of furnishing the necessary service.

In many cases it has been recognized that these power

men could meet the situation by turning their hand to the sale of meat grinders, coffee mills, drink mixers and the innumerable small appliances which are salable to the home, store and office; in fact, anything else that may be sold at a profit and provide the type of off-peak load at lighting rates which at such a time is desirable.

In three of the Doherty properties—namely, Warren, Mansfield and Massillon, Ohio—the power men are paying not only their salaries but a profit to their companies by the sale of such equipment. At the same time they are selling rectifiers, shafting, flywheels, pulleys and anything else along these lines which will show a merchandising profit and give service to the customer.

The salesmen of the Doherty organization are now all operating on a salary plus commission basis, which demonstrates whether or not the man is profitable. There is, therefore, no expectation of reducing the size of any of the local sales departments, but rather of concentrating the effort on the sale of appliances which will show a merchandising profit and not involve any additional peak load.

CARRYING CURTAILMENT POLICY TO EXTREMES

With Existing Delivery Situation, Interest Saving by
Carrying Lower Stocks May Be More than
Offset by Customers' Inconvenience

An example of the extremes to which a curtailment policy in the central station's new-business department may be carried is instanced by a New England jobber. A group of central stations under the management of a banking syndicate is at present purchasing electrical appliances in very small lots. Records are kept of the assignment of these appliances to the different companies under common management, one company being supplied with a certain class of appliances like percolators, another with heating pads, a third with sewing-machine motors, and so on. When a customer in any company desires to purchase an appliance not carried in sufficient stock locally the local manager consults his list and sends an order to the company carrying that particular equipment for early delivery. In due course the order is filled or an article sold on the spot replaced. In discussing this policy, the jobber pointed out that while it enables a minimum stock to be carried among a group of central stations, it is difficult to render adequate service to the public in this way.

The cost of sending appliances by parcel post or by express, with present-day lack of speed in transportation, tends to offset the saving effected in interest charges on appliances carried locally and to inconvenience the buying public perhaps more than is necessary in view of the off-peak character of much appliance service in relation to other demands upon the

plant. Even the local dealer does not benefit from this policy unless the central-station manager sees fit to fill orders from the retailer's stock in a co-operative spirit.

ELECTRIC INDUSTRIAL TRUCKS AT TERMINALS

Inasmuch as the Storage Batteries Are Charged During the Night, This Service Furnishes an Off-Peak Station Load

As evidence of what the electric industrial truck can do to reduce congestion at railroad terminals the accompanying illustration is given. Eleven large trunks are here shown being taken away from an Eastern rail-

ONE TRUCK EASILY CARRIES ELEVEN LARGE TRUNKS

road ferry station at one time. One advantageous feature of this load for central stations is that a large part of it is off-peak—the battery charging being done during the night.

SPECIAL ILLUMINATION DEMONSTRATION ROOM

Designed to Aid in Showing Prospective Customers the Latest Developments in Efficient Lighting

The Harrisburg (Pa.) Light & Power Company has recently installed under the salesroom a special illumination demonstrating room, intended to aid in showing prospective or present customers the latest developments in efficient illumination. A wide variety of lamps, reflectors and fixture equipment has been installed, so that it is possible to demonstrate office, factory, store or window lighting under varying conditions.

It is not the intention of the Harrisburg electric department to compete with the local-supply dealers now selling fixtures and reflectors to commercial and industrial customers. The fixture manufacturers, however, have co-operated in the equipment of this room with samples of the latest models, and fixtures will be sold at a profit to customers who come to the company for advice in illumination matters. This equipment, the company feels, places it in a position to give far more assistance to the consumer than the average electrical supply dealer can afford.

LIGHTLESS NIGHTS IN HYDROELECTRIC TERRITORY

Conservation of Fuels Shown to Be the Assured Result from the Widest Use of Energy Generated by Water Power

The Utah Power & Light Company, Salt Lake City, Utah, which operates with hydroelectric power, is running the advertisement here reproduced, with the

ELECTRICITY'S PART IN FUEL SAVING

So serious is the coal shortage throughout the United States that it has become the patriotic and imperative duty of each individual to aid to the utmost in the conservation of commercial fuel.

This can best be done by the use of Electricity, generated solely by water power.

The generating of hydroelectrical energy requires no fuel.

Even the water turning the wheels of the enormous power plants operated by this company is not consumed or contaminated, but returns at once and without diminution to its natural channels. During the present year—1917—the Utah Power & Light Company generated 500,000,000 kilowatt-hours of electrical energy, which in its many uses is doing work in the mines, factories, farms and homes of this great intermountain territory that otherwise would have necessitated the use of 1,000,000 tons of coal. It would have required 25,000 coal cars and more than 500 locomotives to have transported this vast quantity of coal to the consumers.

To curtail your use of electric service, or to fail in utilizing electricity to the very fullest extent in business and in your home, is to fail in doing your full share to support the government's fuel conservation policy.

There are many uses in every business and in every home for electric service where a direct and material saving of coal will result.

Electric cooking and electric ironing are important factors.

In 2200 residences, hotels and restaurants throughout this company's territory electric service is being used to-day for cooking. And by using electricity for this purpose these 2200 consumers are saving the government 30,000 tons of coal annually.

If 22,000 consumers used electricity for cooking the saving would be 300,000 tons of coal annually.

In practically every industrial pursuit in the intermountain West electricity is simplifying manufacturing processes, abolishing wasted effort, increasing production, cutting operating costs—and SAVING FUEL.

UTAH POWER & LIGHT COMPANY
Efficient Public Service

thought of indirectly educating the public to the inadvisability of observing "lightless nights" in hydroelectric territory. "Lightless nights" were instituted not to curtail electric lighting company revenue, but to conserve the supply of fuels. Where water power is used no energy is conserved by turning off the lights—rather is it wasted. In this instance the company urges the widest use of electricity, so that fuels will be used less and the supply thereby conserved.

LOAD CHARACTERISTICS OF AUTOMOBILE TIRE FACTORY

Assembled Data on the Machines Installed, on the Characteristics of Demand and on Unit Energy Consumption

The installation of the Ehman Tire & Rubber Company of Chicago is an example of a medium-sized tire company from which data of a generally applicable character may be taken. All of the service is supplied at 220 volts, three-phase, 60 cycles, from the lines of the

LOAD CURVE OF TIRE FACTORY PRODUCING 500 TIRES A DAY (HALF-HOUR READINGS)

Commonwealth Edison Company. It is all utilized as alternating current except that energy required to operate a 90-hp. calender. Direct current for this machine is supplied by a 100-kw. rotary converter operating from the alternating-current supply. One calender is driven by an alternating-current motor, a departure from usual practice. Lighting is supplied through an auto-transformer connected so that all service will come through one meter and thus give the tire company the benefit of receiving a simultaneous maximum demand.

The table herewith is a complete record of the elec-

MOTOR-DRIVEN MILLS AND CALENDERS

trically driven apparatus at the plant of the Ehman company. It shows the connected electric load exclusive of lighting to be 750 hp. The curve reproduced shows the uniform character of the company's load. The maximum demand occurred between 7:30 p. m. and 8 p. m. and amounted to 153 kw., giving a demand fac-

tor of 27.2 per cent and a load factor of 74.7 per cent. The peak was only a few kilowatts above the usual demand. The total energy consumed in September, the month in which the demand curve was made, was 52,200 kw.-hr. During this month the company's output

DATA ON MOTOR APPLICATIONS

Number of Units	Type Machine	Type of Drive	Manufacturer	Size of Motor in Hp.
2	Mill	Gear	Birmingham	100.0
1	Mill	Gear	Birmingham	50.0
1	Mixer	Gear	Birmingham	75.0
1	Mixer	Gear	Birmingham	75.0
1	Hydraulic pump	Gear	Davis	7.5
1	Calender	Gear	Birmingham	50.0
1	Calender	Gear	Vaughn	90.0
2	Mills	Gear	Vaughn	35.0
1	Mill	Gear	Vaughn	100.0
1	Mill	Gear	Farrell	40.0

1	Treadmill	Gear	Adamson	15.0
1	Rotary converter	100.0
Total.....				750 hp.

amounted to 500 tires a day, the tires including all of the more common sizes. It can also be shown that the energy consumption per tire was only 3.48 kw.-hr. and amounts to only a very small fraction of the tire cost. With the exception of three buffers and one cement mixer, for which the data could not be obtained, General Electric motors are used.

PRESENT-DAY VALUE OF STOCK OF MOTORS

Georgia Company Sells in Eighteen Months 175 Motors, Aggregating 7140 Hp., or an Average of 41 Hp. per Machine

During the last eighteen months the Georgia Railway & Power Company has sold to its various hydroelectric customers 175 electric motors, aggregating 7140 hp., the cost totaling \$101,667. The greater portion of these motors were furnished from the company's stock.

In the opinion of the sales department of the company, this stock has been a valuable asset in that some very substantial power business has been placed on the company's lines which might have been lost had not the motors been immediately available for emergency purposes. Moreover, new business has been secured owing to the fact that motors were delivered promptly, where, on the other hand, the customer might have been delayed through long deliveries from the manufacturer.

While the number, horsepower and value of motors handled by the company run into big figures, they do not include sales made by the motor manufacturers direct to customers. In the same period the manufacturers sold approximately 31,500 hp. in motors, aggregating \$662,000 in value. Calculations based on motor sales from company stock indicate the following average horsepower per motor: 220-volt, 19.8 hp.; 550-volt, 41.5 hp.; 2300-volt, 68 hp. The grand average size is 41 hp. per motor.

TECHNICAL THEORY & PRACTICE

Including a Digest of Important Articles Appearing in
the Scientific and Engineering Press
of the World

Generators, Motors and Transformers

Starting Rotary Converters When Connected to Transformer Secondaries.—F. D. NEWBURY and M. W. SMITH.—When rotary converter transformers are permanently connected to the slip rings, starting from the direct-current end requires a larger starting current and the torque is not so good as with an arrangement where the alternating-current circuit is open. The authors analyze these conditions in this article.—*Electric Journal*, January, 1918.

Lamps and Lighting

A New Spherical Photometer for Incandescent Lamps.—The introduction of gas-filled lamps of novel shapes has made necessary a new style of photometer which will measure, not the mean horizontal luminous intensity, as in the old types of lamp, but the mean luminous intensity in space. With this end in view, a spherical photometer made of zinc sheets, polished on the inside, has been developed. An opening closed by a small panel permits the introduction of the lamp. Behind a disk of opal glass closing an opening on the horizontal surface of the apparatus, in an oblique direction from the lamp, is a Lummer-Brodhun photometer. In a tube connecting with the latter is another luminous source, also furnished with a disk of opal glass. The method of making the tests is to bring the lights derived through the two disks to equal values. How this is done is fully explained and the apparatus is illustrated by diagram and photograph.—*Revue Générale de l'Electricité*, Nov. 24, 1917 (abstracted from *Elektrotechnische Zeitschrift*, April 5, 1917).

Generation, Transmission and Distribution

The Properties of Electrolytic Copper.—B. WELBOURN.—The author of this article presents tests that were made on an experimental span under working conditions with different cross-sections of copper conductors and different numbers of strands.—*Journal of (British) Institution of Electrical Engineers*, December, 1917.

Suppression of Arcs Due to Accidental Ground.—M. H. COLBOHM.—Service disturbances or interruptions in transmission systems are in most cases occasioned by grounds or short circuits on the power line through outside influences, such as lightning, sleet or wind. Effective means for eliminating such causes cannot, therefore, be provided within the system itself and only relief in suppressing their bad effects on the system can be sought. Different kinds of equipment are in use for the elimination of ground trouble, depending upon whether the system operates with the neutral point isolated, dead-grounded or grounded through resistance. The author describes the kinds of equipment used in the three types of systems cited and points out their distinguishing features and their influence upon service. In this connection potential stresses, mechan-

ical stresses, reliability of operation, attendance required, detection of faulty lines, advantage of ground rheostat for line testing and emergency construction and comparative costs are taken up.—*Electric Journal*, January, 1918.

Aluminum-Iron-Rope Cable for High-Tension Transmission Lines.—A certain power transmission line in Germany designed and planned in 1914 could not be completed along the lines contemplated because of the shortage of copper. It was found impossible to substitute iron wire because the supports (already in place) had not been built strong enough to withstand the great stresses caused by the heavier iron wire. Other reasons, which are withheld from public discussion, prevented the use of steel-cored aluminum wire. The final solution of the problem, as reported by E. G. Fischinger of Dresden in the *Elektrotechnische Zeitschrift*, is as follows: Oil-saturated paper twine of 3.5-mm. diameter is wrapped with a strip of galvanized iron 7.5 mm. wide and 0.3 mm. thick in a "right-hand" spiral. Around this are wound in closely wrapped left-hand spirals six galvanized-iron wires 3.9 mm. in diameter. The iron core is then covered by twelve aluminum wires of 4.1 mm. diameter wound in a long-pitch right-hand spiral. The oiled paper is burned out as soon as the winding is completed, leaving a hollow iron-aluminum cable which has a wide range of elasticity, adapting it to severe wind and temperature stresses. The cable has a tensile strength of 6790 kg. (30 kg.-mm.²), or nearly one and a half times that of a pure aluminum cable.—*Schweizerische Bauzeitung*, Dec. 15, 1917.

Traction

Heating of the Armature in Traction Motors.—LEONHARD ADLER.—The author proposes to estimate the extent of armature heating by the measure of the resistance, a method much more rapid, simple and practical than the thermometric method. It is not necessary to measure the resistance of all the armature coils, but only of a portion of those in identical conditions. With high-powered motors it may be well to raise some of the brushes and insulate them by bands of presspan, though this precaution is not necessary with tramway motors, which usually have wave windings. One advantage of the method advocated is that it can be used when the tractors are in motion, which is impossible with the thermometric system. Resistances as low as 0.001 ohm can be measured by the Thomson apparatus.—*Revue Générale de l'Electricité*, Nov. 24, 1917 (abstracted from *Elektrotechnische Zeitschrift*, June 28, 1917).

Further Railroad Electrification Important.—F. H. SHEPARD.—The author points out in this article that electrical equipment provides a most effective way of increasing transportation capacity.—*Electric Railway Journal*, Jan. 5, 1918.

Installations, Systems and Appliances

Steam Central Station for Hanover, Germany.—The much-discussed plans for a single central station for all Germany have been brought nearer completion by the beginning of work on a state-owned power station in Hanover. This station will be operated by steam turbines of 10,000-kw. rating each—three of these turbines being installed to start with. It will form the connecting link between the two finished stations at Dörverden (Weser River) and Minden (Rhine-Weser Canal) and the two stations now nearing completion on the upper Weser and the Main, all of which are of the hydro-electric type. The completion of the Hanover station will form the last link of the chain reaching from the upper Main River to the North Sea coast, covering all of Germany west of the Elbe. The Hanover station is designed for three stages of development—50,000,000 kw.-hr., 90,000,000 kw.-hr. and 120,000,000 kw.-hr. The estimated construction cost will be 13,000,000 marks (\$3,250,000), and maintenance costs \$750,000 annually.—*Schweizerische Bauzeitung*, Dec. 15, 1917.

Electrophysics and Magnetism

Some Electrical Properties of Silver Sulphide.—GEORGE W. VINAL.—Silver sulphide may be prepared in the form of short wires or thin strips like a metal. The wire, which must be drawn hot, has been found to conduct electricity like a metal of high specific resistance and has a practically zero temperature coefficient. The strip of sulphide, rolled at room temperature, has a large negative temperature coefficient and shows both metallic and electrolytic conduction at the same time. It has a volt-ampere curve characteristic of a pyro-electric conductor. The resistance of these strips has been examined with both alternating and direct current, with the result that the alternating-current resistance was nearly always found to be higher than that with the direct current, and the passage of a small alternating current of a frequency as low as 60 cycles increased temporarily the resistance of the sulphide, while a small direct current produced the opposite effect.—*Bureau of Standards, Scientific Paper No. 310*.

Units, Measurements and Instruments

A Method for Testing Current Transformers.—FRANCIS B. SILSBEE.—A general method is outlined in this paper for the determination of the ratio and phase angle of current transformers in terms of the constants of previously calibrated standard transformers of the same nominal ratio. It has been shown that such methods are essentially more sensitive, or, conversely, may be used with much less sensitive instruments, than the laboratory methods now in use for the absolute determination of the ratio and phase angle of a single transformer. Two of the most convenient of the many possible modifications of the general method are described in detail. It is hoped that the methods will be found useful in commercial plants where delicate laboratory equipment is not available and where large numbers of transformers must be tested rapidly and with moderate accuracy.—*Bureau of Standards, Scientific Paper No. 309*.

Telegraphy, Telephony and Signals

Theoretical Calibration of Condenser Transmitter.—I. B. CRANDALL (Research Laboratory of the American Telephone & Telegraph Company and Western Elec-

tric Company).—The object of this paper is to complete as far as necessary the mechanical theory of the condenser transmitter. The mechanism of air-damping has been determined, and formulas have been obtained from which practical calculations can be made. A complete theoretical calibration of a condenser transmitter has been given which is consistent with the experimental calibration and which does not disturb the uniform frequency-sensitiveness characteristic of the instrument except at frequencies very near zero. The principles have been given for the design of air-damped systems of maximum damping and condenser transmitters having rigorously uniform sensitiveness over an extended range of frequencies, including zero.—Presented before American Physical Society, Dec. 28, 1917.

Measurement of Continuous Waves.—A discussion on how to calibrate a wavemeter that is recommended in the article.—*Wireless World*, December, 1917.

Miscellaneous

Industrial Specialization of Engineers.—E. PIERNET.—A plea for the establishment of technical high schools after the model of the Ecole Supérieure d'Electricité of France and the German "Hochschulen." The results due to the latter as impressed upon the author in the course of many years' employment in a large metallurgical plant on the Saar are outlined.—*Revue Générale de l'Electricité*, Nov. 24, 1917.

Effect of Brick Arch on Smoke Abatement.—An article on the principles underlying methods of securing complete combustion.—*Power Plant Engineering*, Dec. 1, 1917.

A New Insulating Material.—A new type of insulating material for which special properties are claimed is described. Besides having good insulating properties, it can be molded to any desired shape and cut or worked either by hand or machine. It is also practically incombustible, non-absorbent and does not have to be varnished. It is considered suitable for many electrical applications for which porcelain, marble and various vulcanized preparations are at present employed. The cost is also stated to be relatively low. The material is said to have the following constituents:

	Per Cent
Powdered flax	51.7
Sifted mica	14
Mineral rubber	20
Resin	1
Rubber solution	10
Flowers of sulphur.....	3
Selenium bisulphide	0.3

It is pointed out that the selenium bisulphide is used only as a suitable binding material, which facilitates the combination of the other ingredients and evaporates when the substance is left in the air after mixing. Carbon bisulphide may also be employed. The other substances are all capable of close mixing. The mineral rubber recommended is a soft mineral deposit which occurs in certain oleaginous schists. The proportions of the materials may be varied within certain limits, according to the use to which the material is to be put. After the substance has been dried it can be softened by being immersed in a steam-jacket vessel. When thus reduced to the plastic state it can be compressed into any desired form.—Abstracted from the *Revue Générale d'Electricité* in the *London Electrician*, Dec. 7, 1917.

Scientific and Industrial Research

A Department Devoted to Interchange of Ideas, Investigations Contemplated, Research Facilities Available, and Suggestions for Co-operative Work.

Conducted by PROF. VLADIMIR KARAPETOFF

Cornell University, Ithaca, N. Y.

Summary of Investigations, Available Apparatus and Research Suggestions

INVESTIGATIONS UNDER WAY OR COMPLETED (RESEARCH WORK REPORTED SINCE DEC. 15)*

CONDENSERS, ABSORPTION IN.

The absorbed charge is allowed to flow continuously through a sensitive shunted galvanometer; simultaneous readings of deflections and time are noted. It is then possible to plot discharge current with time of flow and determine, with a planimeter, the integrated value of idt between chosen time limits (in certain cases the time of flow is ten hours or more). The absorbed charge is studied as a function of the time of charge and of the charging voltage. Results are expressed graphically. A striking result is that the absorbed charge may be hundreds of times greater than a computed charge calculated from $hQ-CV$, where V is the steady applied voltage and C the capacity as measured on 60-cycle alternating current.—*L. Pyle, Washington University, St. Louis.*

CORE LOSS AT HIGH FREQUENCIES.

For the purpose of measuring the losses due to eddy currents and hysteresis, two toroids, both being alike in every respect except that only one contains a specimen of the iron whose losses were to be determined, were connected in series with each other in the secondary of an oscillating circuit. Each of these toroids was placed in a separate calorimeter. If the heat capacities of the calorimeters as well as of the toroids are the same and the I^2R losses in the winding of each toroid are equal, then the heat produced by the specimen of iron in one calorimeter may be balanced in the other calorimeter by means of a direct-current heating coil. The Chaffee gap was used as the source of the oscillations, and the Braun tube was to obtain the oscillograms. The experimental results indicate: (1) that the loss per cycle per cubic centimeter decreases with an increase in frequency; (2) that there is a non-uniform distribution of the magnetic flux due to the "skin effect" produced by the eddy currents.—*C. Nusbaum, Harvard University.*

CORONA (DIRECT-CURRENT), INFLUENCE OF SPARK ON.

A spark gap in series with a discharge tube affects the positive and negative corona in very characteristic ways, the changes being due to intermittent currents. A hot-lime cathode tube has been developed and used in observing the weak pulsating currents which pass through the spark and the corona tube. Evidence can be given in favor of the view that the corona resembles the arc discharge. An attempt at an explanation of the pulsating current has been made.—*S. F. Crooker, University of Illinois, Urbana.*

CORROSION.

Corrosion of non-ferrous metals in sea water and corrosion of condenser tubes in service on land. The inquiry will later be extended to non-ferrous metals under atmospheric conditions.—*Capt. Bengough, Imperial College, London, England.*

FURNACE, ELECTRIC.

Heat is generated by contact resistance between specially shaped graphite parts. An endeavor is being made to substitute pressed carbon similar to that used in arc-lamp electrodes, as the latter can be more easily obtained in England.—*National Physical Laboratory, England.*

FURNACE, ELECTRIC.

Considerable success has been achieved in producing very perfect electrical oscillations and transformations of stored potential electrical energy into the form of heat by the application of a so-called power condenser, and an electric furnace has been constructed based on this principle.—*E. F. Northrup, Princeton University.*

HIGH-VOLTAGE TESTS.

Efficiency of high voltage transmission and the peculiarities of insulators for this kind of work. A new transformer will be installed to permit the production and use of higher voltages than those yet attempted.—*C. F. Harding, Purdue University.*

POWER IN ALTERNATING-CURRENT CIRCUITS.

Derivation of expressions for power and stored electrostatic and magnetic energy in a general network of conductors, with sources of alternating-current power connected thereto. The method of conjugate complex quantities is used.—*J. Slepian, Westinghouse Electric & Manufacturing Company.*

RECTIFIERS, ALUMINUM.

For each of the four cells required in the ordinary arrangement for rectification of alternating current with lead-aluminum cells there was substituted a group of ten cells in series, and by this means a 2200-volt alternating current was rectified. With a considerable inductance in the circuit, the current curve was smoothed out so that it showed less than 20 per cent varia-

tion from its maximum value. When a constant voltage is desired but little or no current, a condenser across the terminals is used with good result.—*N. H. Williams and J. M. Cork, University of Michigan.*

APPARATUS AVAILABLE FOR RESEARCH

BALTIMORE, MD.

Facilities are available for testing high-tension cables for dielectric losses, temperature rise, heat dissipation, current-carrying capacity, etc. A special nine-hole conduit line has been constructed, surrounded by sand which is held in place by a wooden framework. The specimen cable occupies the central duct, while the outside ducts are taken by the "heater cables" for maintaining a desired temperature. A differential galvanometer-type thermometer is used, with numerous coils for measuring the temperature in the ducts. Three-phase 25-cycle current can be sent through the short-circuited specimen cable and high voltage applied at the same time, duplicating actual running conditions, or the high voltage may be applied to it on open circuit for measuring dielectric losses. For the results of some tests using this equipment see *Proceedings A. I. E. E.*, June, 1917, p. 443.—*Consolidated Gas, Electric Light & Power Company.*

HOUSTON, TEX.

Two synchronous machines are available for tests on sudden short-circuits: (1) Standard 45-kva., 500-volt, 60-cycle salient-pole alternator equipped with exploring coils at the top, middle and bottom of stator slots, and full-pitch and short-pitch coils on the rotor. (2) Special 5-kva., 220-volt, four-pole, 1800-r.p.m. non-salient pole alternator with characteristics approximating those of a turbo-alternator. The machine is equipped with several exploring coils in the stator and rotor having a span of a single tooth or a span equal to that of a pole. The rotor coils are brought out to an insulated fiber disk, and any one of them can be connected to a special pair of slip-rings for test purposes.—*N. S. Diamant, Rice Institute.*

SUGGESTIONS FOR RESEARCH

ALTERNATING CURRENTS.

A computing device which would add and multiply complex quantities or vectors. Such a device or machine would greatly save the labor in transmission-line computations and in the pre-determination of performance of some types of electrical machinery.—*Editorial Suggestion.*

BATTERIES.

Some experiments seem to indicate that the electrolytic action in a lead battery is facilitated and made more complete in the presence of radio-active salts, for example radium barium sulphate. Further systematic experiments are desirable (see a recent French patent issued to Mr. Thofehern).

CABLES.

The problem is to dispose of heat due to copper and dielectric losses. This may be done in two ways—(1) by minimizing the amount produced, (2) by quickly conducting away the heat that is produced. The first is largely the problem of the cable manufacturer. The use of certain insulating materials in saturating paper insulation greatly reduces these losses. Cable ratings under some conditions may be more than doubled. We suggest that further investigations be made on the subject of dielectric loss in cables to the end that the laws governing it may be definitely known. It will then be possible for the manufacturer to give an even quality of cable with minimum dielectric loss. The second point is to conduct the heat away from cables after it has been generated. Most of the underground conduits now in use were built without any regard to their capacity to dissipate heat, and thereby immense sums of money have been thrown away. We further suggest that the use of 20,000-volt or 30,000-volt cables be investigated.—*A. I. E. E. Committee on Transmission and Distribution.*

CONDUCTORS, HARDNESS TESTS.

Development of a simple measure for detecting hard-drawn copper wire which is unsuitable for winding electrical coils. The method should be simple enough to be used in a factory without refined apparatus.—*C. E. Skinner, Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa.*

(1) A piece of steel wire might be pressed crosswise into the lateral surface of the copper wire under investigation. The magnitude of the impression left with a given force would be an indication of the degree of hardness. (2) There might be a difference of electric potential between soft copper wire and partially hard-drawn copper wire. The electrolyte used for this purpose should be acidulated copper sulphate. The difference of potential can be measured by a potentiometer. (3) One end of a piece of wire under test is clamped in a vise and the other end is provided with an iron tip. The wire is then made to vibrate under the action of an alternating-current electromagnet. The behavior of a soft wire will probably be different from that of a hard-drawn one. The vibrations can be made quite intense by adjusting the length of the sample to a natural frequency equal to or a multiple of that of the alternating current in the electromagnet.—*Editorial Suggestions.*

COPPER, TEMPERATURE COEFFICIENT.

Determination of the resistance coefficient of copper for a wide range of temperatures exceeding 200 deg. C.—*B. A. Behrend, Boston, Mass.*

CRANE.

In a traveling crane, a safety limit stop based on a dynamic brake action on the bridge travel motor, in conjunction with the ordinary type of rigid or spring bumpers. The museum will be pleased to receive expressions of opinion on the possibilities of such a device.—*American Museum of Safety, New York City.*

ELEVATORS.

Improvements in motors and control where only single-phase supply is available. This includes not only the use of single-phase motors, but also transformation to polyphase or to direct current.—*Editorial Suggestion.*

HYSTERESIS.

Rotatory hysteresis and the diminution of molecular losses at high densities.—*B. A. Behrend, Boston, Mass.*

*Reported in the *Michigan Technic*, December, 1917.

*The names of individuals given after each institution reporting investigations are those of persons with whom others interested should communicate. All institutions reporting research work should give such names.

SWEEPING ORDER OF FUEL ADMINISTRATOR

To Solve Its Problem the Fuel Administration Orders
Suspension of Industries for Five Days
and Ten Mondays

The text of Dr. Garfield's order closing down industries to conserve fuel had not been completed at a late hour on Wednesday evening, Jan. 16. The Fuel Administration, however, issued a general statement on the order, and also an abstract of the essential provisions of the order.

"ALL INDUSTRY EQUALLY RESTRICTED."

The statement that was issued by the Fuel Administrator follows in part:

The unprecedented adverse weather conditions of recent weeks and the inadequacy of the present coal supply and transportation facilities to meet the enormous wartime demand have made necessary immediate restrictive measures to the use of coal in that part of the United States east of the Mississippi River.

The movement of coal in transportation must be so directed as to aid the Director-General of Railways in dealing with the railroad emergency created by recent blizzard conditions. Domestic consumers of coal must be kept warm, and other absolutely necessary consumers must be supplied.

All industry must be equally restricted in its use of coal in order that the available supply for the remainder of the winter may be properly distributed and may be made sufficient for absolutely essential needs during the remainder of the winter.

To meet these necessities, the Fuel Administration has ordered as an immediate emergency measure that on the days of Jan. 18, 19, 20, 21 and 22 preference and priority in the use of coal shall be given only to those consumers whose consumption of coal is absolutely necessary.

During the five days designated no manufacturing industry shall be allowed to operate even if it has its coal supply on hand. By this means all industry will be placed on an equal footing and each will be called upon to make its share of the sacrifice necessary to maintain the nation at the highest possible point of military and economic efficiency for the prosecution of the war.

In addition to this emergency restriction over the designated five days, the Fuel Administration has ordered that all use of fuel except by consumers classed as absolutely necessary shall be prohibited on Monday of each week from Jan. 21 to March 25; that is, on Jan. 21 and 28, Feb. 4, 11, 18 and 25 and March 4, 11, 18 and 25.

The order under which these restrictions are made is designed to distribute with absolute impartiality the burden of patriotic denial. All classes of business are treated alike.

Except on the days covered in the order, the normal

supply of coal to all consumers will be maintained. The necessary consumers designated in the order are given preference and priority in the delivery and use of coal at all times as well as on the days when other use of coal is prohibited.

The United States Fuel Administration counts upon the complete patriotic co-operation of every individual, firm and corporation affected by the order in its enforcement. Every effort will be made by the Fuel Administration and other government officials charged with the enforcement of the order to carry out the plan proposed without undue interference with the ordinary course of business.

It is the earnest desire of the Fuel Administration to prevent entirely any dislocation of industry or of labor.

ESSENTIAL PROVISIONS OF ORDER

The abstract of the order as issued in Washington follows:

(1) Until further order of the United States Fuel Administrator, all persons selling fuel in whatever capacity shall give preference to orders for necessary requirements

- (a) Of railroads;
- (b) Of domestic consumers, hospitals, charitable institutions and army and navy cantonments;
- (c) Of public utilities, telephone and telegraph plants;
- (d) Of ships and vessels for bunker purposes;
- (e) Of the United States for strictly governmental purposes, not including orders from or for factories or plants working on contracts for the United States;
- (f) Of municipal, county or state governments for necessary public uses;
- (g) Of manufacturers of perishable food or of food for necessary immediate consumption.

The order further provides that on Jan. 18, 19, 20, 21 and 22, 1918, no fuel shall be delivered to any person, firm, association or corporation for any uses or requirements not included in the foregoing list until the requirements included in the list shall have been first delivered.

On Jan. 18, 19, 20, 21 and 22, 1918, and also on each and every Monday beginning Jan. 28, 1918, and continuing up to and including March 25, 1918, no manufacturing plant shall burn fuel or use power derived from fuel for any purpose except—

(a) Such plants as from their nature must be continuously operated seven days each week to avoid serious injury to the plant itself or its contents.

(b) Manufacturers of perishable foods.

(c) Manufacturers of food not perishable and not in immediate demand, who may burn fuel to such extent as is authorized by the Fuel Administrator of the state in which such plant is located or by his representative authorized therefor, upon application by the United States Food Administrator.

(d) Printers or publishers of daily papers may burn fuel as usual excepting on every Monday from Jan. 21 to March 25, 1918, inclusive, on which days they may burn fuel to such extent as is necessary to issue such editions as such papers customarily issue on important national legal holidays, and where such papers do not issue any editions on a holiday they are permitted to issue one edition on the said Mondays.

(e) Printing establishments may burn fuel on Jan. 18, 19, 20 and 22 to such extent as is necessary to issue current numbers of magazines and other publications periodically issued.

On each Monday, beginning Jan. 21, 1918, and continuing to and including Monday, March 25, 1918, no fuel shall be

burned (except to such extent as is essential to prevent injury to property from freezing) for the purpose of supplying heat for:

- (a) Any business or professional offices, except offices used by the United States, state, county or municipal governments, transportation companies, or which are occupied by banks and trust companies or by physicians or dentists;
- (b) Wholesale or retail stores, or any other stores, business houses or buildings whatever, except that for the purpose of selling food only, for which purposes stores may maintain necessary heat until 12 o'clock noon; and for the purpose of selling drugs and medical supplies only stores may maintain necessary heat throughout the day and evening;
- (c) Theaters, moving-picture houses, bowling alleys, billiard rooms, private or public dance halls, or any other place of amusement.

On the above specified Mondays no fuel shall be burned for the purpose of heating rooms or buildings in which liquor is sold on those days.

No fuel shall be burned on any of the foregoing specified Mondays for the purpose of supplying power for the movement of surface, elevated, subway or suburban cars or trains in excess of the amount used on the Sundays previous thereto.

The order provides that nothing in this order shall be held to forbid the burning of fuel to heat rooms or such portions of buildings as are used in connection with the production or distribution of fuel.

The state fuel administrators are authorized by the order to issue orders on special applications for relief, where necessary, to prevent injury to health or destruction of or injury to property by fire or freezing.

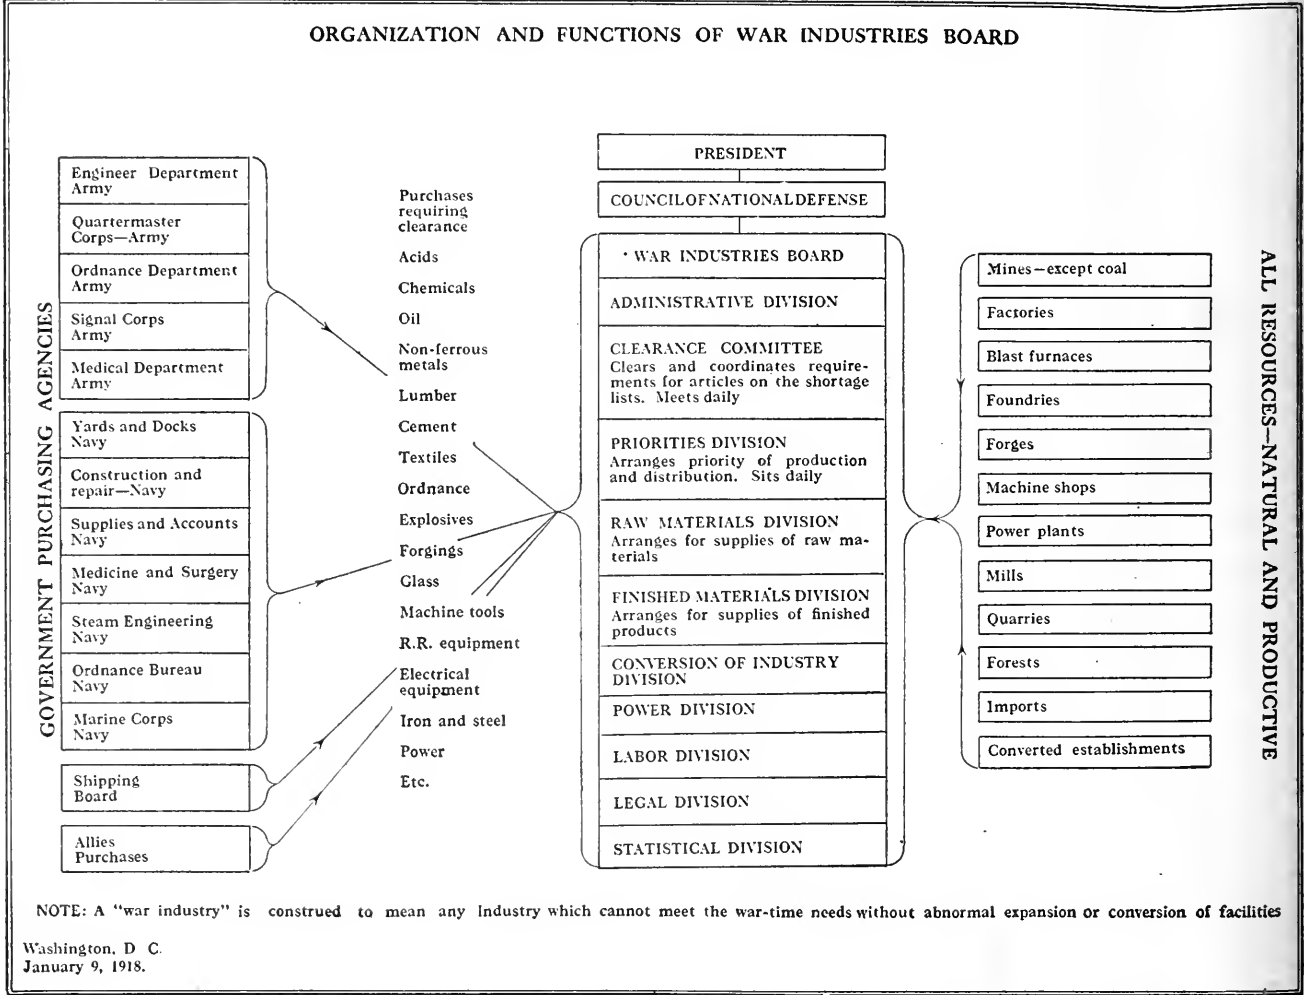

The order is effective in all of the territory of the United States east of the Mississippi River, including the whole of the States of Louisiana and Minnesota.

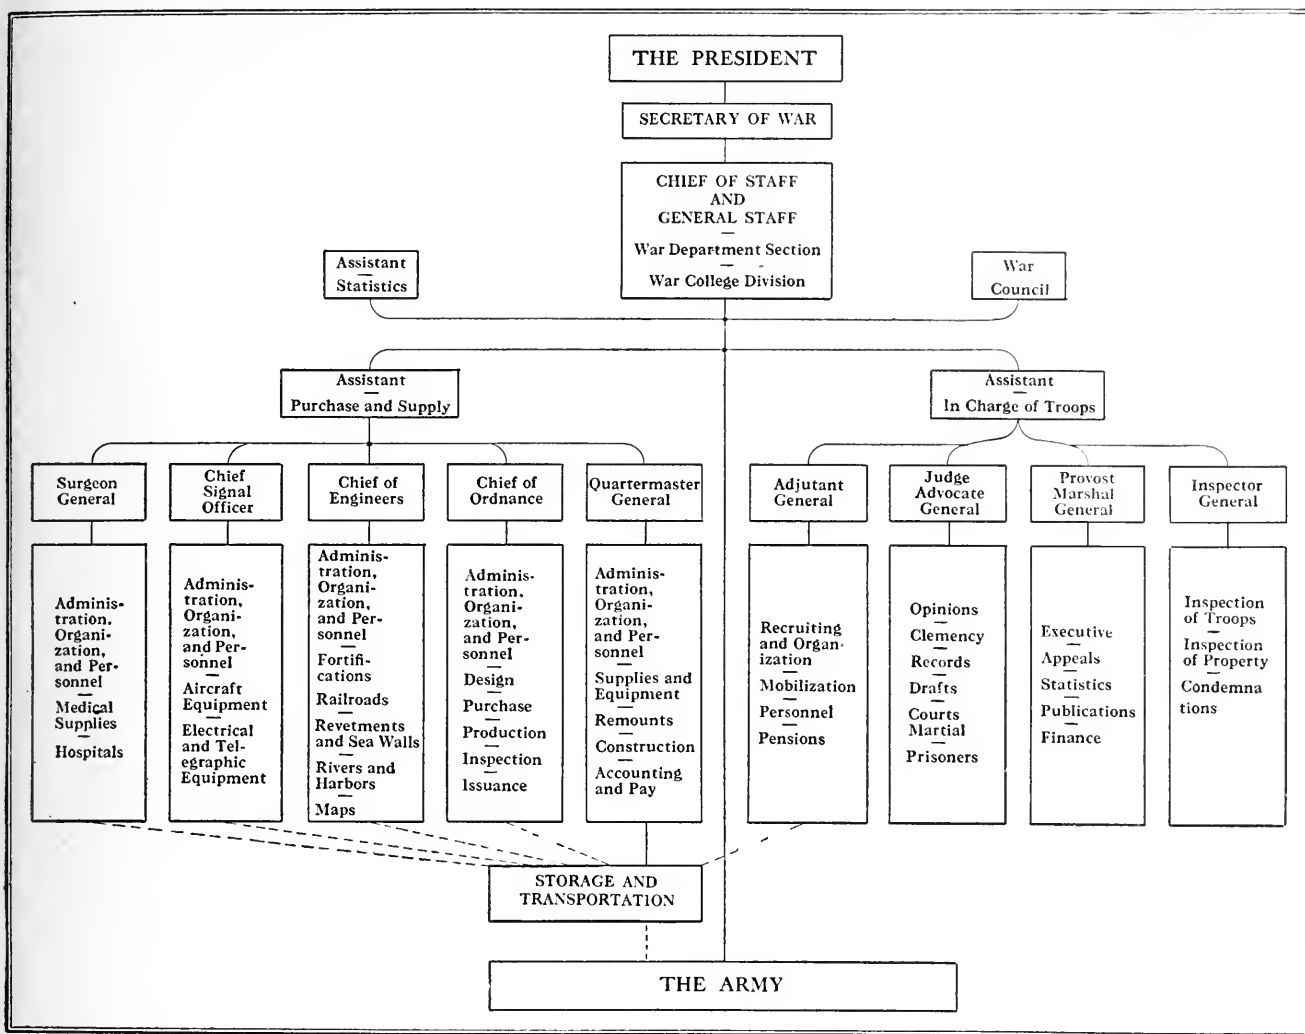

CHARLES L. EDGAR VIEWS EFFECT OF THE FUEL ORDER

Little Reduction in Lighting, but Considerable Reduction in Output to Industrial Plants Other Than Those Engaged on Government Work

Charles L. Edgar, president of the Edison Electric Illuminating Company of Boston, said that until he had seen the detailed order of the Fuel Administration he could make no accurate estimate of how much it will reduce the coal consumption at the Edison plant. He added:

About one-half of our product is power and the other half light. There will probably be little reduction in the use of light. We have 1,000,000 customers who will use practically as much light, and the streets must be kept lighted. About one-third of the power we supply goes to government plants or factories making war supplies. From what I now know of the order there will be a considerable reduction of the two-thirds of our power output which goes to other industrial plants. We use about 5000 tons of coal a day. The recent "lightless" night order and other economies in the use of lights have reduced our daily coal consumption only from 30 to 40 tons a day. We have plenty of coal. I have not as full a knowledge of the coal situation as if we had ourselves been affected by the shortage. I did not suppose, however, that the situation was so serious as is indicated by the order just issued. This will bring great hardships to working people and their families, coming as it does in the middle of winter. I believe that the administration officials, realizing the hardships the order would bring, must have felt fully justified from the conditions in adopting such drastic measures.

CO-ORDINATION PLAN FOR WAR PURCHASING

Outline of the New War Department Arrangements for Purchasing Supplies of Every Character for War Purposes Here

Secretary of War Baker explained in considerable detail to the Senate committee on military affairs on Jan. 12 the reason for his personal objection at this time to the creation of a Director of Munitions to supervise all purchases of supplies of every sort for war purposes in this country. These reasons may be summarized briefly by the statement that the reorganization of the War Department and the War Industries Board will provide an entirely suitable agency for promptly and efficiently performing such work and should be tried before the present organization, now in process of remodeling in the light of the experience of the administration in war work up to date, is thrown into inevitable confusion by drastic changes.

The War Department is not alone in making great drafts on the industries of the country. The Allies' Purchasing Board, the Navy Department and the Shipping Board are similarly straining the resources of our manufacturers and no legal remedy for this condition has been provided by Congress. But the four great purchasing agencies have agreed to joint action through the War Industries Board, which has been reorganized in order that it may do for all American munition manufacturers what the central bureau of the War Department does for its five great purchasing

branches. The requirements of the four agencies are reported to a central committee, which is directly in touch with the manufacturing facilities of the country and not only knows how much work each factory is doing for the government but also how much it is doing for necessary civilian customers. It is this committee which passes on the priority to be given each of the orders. If its decisions are questioned, the appeal is made to the War Industries Board, which thus becomes arbiter of manufacturing priority in this country in every industry furnishing supplies for military uses.

Secretary Baker assured the Senate committee on military affairs that this system of handling the government war purchases in co-operation with those of the Allies was not only the best that careful study had been able to suggest but had met with the approval of the industrial leaders to which it had been submitted. It disorganized none of the existing machinery and interfered as little as possible with meeting civilian demands, in his opinion. It was the equivalent, he believed, of a special director of munitions, for any functions which such a director would possess would be possessed by Daniel Willard, chairman and executive officer of the War Industries Board. The chairman did not have legal authority to enforce his decisions, but as each of the four great war purchasing agencies had agreed to recognize his decisions as binding, it had not seemed necessary to ask congressional action to confer legal powers upon him.

The essence of the organization, according to Secre-

tary Baker, is that each of the four great purchasers—the Allies' committee, the War and Navy Departments and the Shipping Board—has its own organization for acquiring its supplies in the desired order. While the War Industries Board has these orders filled in the sequence of the war needs, manufacturing facilities and civilian requirements are served in the best possible manner. It is apparently the administration's answer to the criticism that Washington had no logical plan for mobilizing the nation's resources. According to Secretary Baker, it is the most complete plan for the purpose that has been advanced in this country or Great Britain. It manifestly created a deep impression upon members of the Senate committee, who have indicated their disapproval of many features of the work of the War Department since the United States entered upon the war.

WESTINGHOUSE COMPANY

ISSUES \$15,000,000 NOTES

One-Year Securities Put Out Without Objection of Federal Reserve Board—Unfilled Orders Jan. 1, Excluding Rifles, \$130,000,000

The Westinghouse Electric & Manufacturing Company has sold \$15,000,000 of one-year 6 per cent notes to Kuhn, Loeb & Co., New York. The notes were offered by the bankers to the public at 99 and interest, yielding a little over 7 per cent net.

A letter to the bankers from Guy E. Tripp as chairman of the Westinghouse company gives the following information regarding the purpose of the issue:

In order to assure to itself for a fixed period working capital temporarily required to carry the large inventories which it is essential that the company should have under present conditions, the Westinghouse Electric & Manufacturing Company has decided to create an issue of 6 per cent one-year gold notes, limited to \$15,000,000. This company has advised the Federal Reserve Board of its intention to issue these notes, and the board has stated that it has no objection to the issue being made.

The indenture under which the notes are to be issued will provide that the company (including its proprietary companies as defined in said indenture) shall at all times while the notes are outstanding have on hand current assets, as defined in said indenture, equal to at least twice the amount of its current obligations, as also therein defined, and that it will not hereafter and so long as any of the notes are outstanding make or permit to be made any mortgage on any of its properties or the properties of any of its said proprietary companies.

The new notes will be issued in denominations of \$1,000 each, will be in coupon bearer form and will mature on Feb. 1, 1919. Interest at the rate of 6 per cent per annum will be payable semi-annually on Aug. 1, 1918, and Feb. 1, 1919. Both principal and interest of the notes will be payable without deduction for any tax or taxes which the company or the trustee under the indenture may be required to pay or to retain therefrom under any present or future law of the United States of America (except any federal income tax) or of any state, county, municipality or other taxing authority therein.

As of Jan. 1, 1918, the company had on hand unfilled orders amounting to more than \$130,000,000, exclusive of contracts for rifles. As of Dec. 1, 1917, its current assets as they will be defined in the indenture amounted to over \$71,000,000, while its current liabilities as so defined amounted to less than \$24,000,000, which the present issue of notes will not increase, as the proceeds thereof will be applied to the payment of outstanding notes. The funded debt of the company, consisting almost entirely of the Westinghouse Machine Company first and refunding mortgage

bonds, due 1940, amounts to about \$6,700,000, and its capital stock, now paying 7 per cent dividends per annum, amounts to \$74,812,650 and has a present market value of over \$60,000,000.

The earnings of the company for the eight months ended Nov. 30, 1917, after deduction of all interest charges and after setting aside a maximum reserve for all income and excess profits taxes, amounted to \$9,032,823, which is only \$582,101 less than for the same period of the previous fiscal year, when there were no war income or excess profits taxes deductible.

WAR SERVICE WORK OF MANUFACTURERS' COMMITTEES

Meeting of Chairmen of Group Committees of Manufacturers of Electrical Supplies Emphasizes Desire to Organize the Whole Industry

A meeting of chairmen of the war service group committees of manufacturers of electrical supplies was held on Jan. 11 at the rooms of the Associated Manufacturers of Electrical Supplies, New York. It was called to hear reports from the chairmen of the committees and to further the co-ordination of their war service work for the government. Robert K. Sheppard, chairman of the General War Service Committee of the Electrical Manufacturing Industry, presided.

It was made plain at the meeting that, as stated previously in the ELECTRICAL WORLD, the whole purpose of the movement is to effect complete organization of every branch of the industry in the interest of service to the government. To this end the chairmen of the committees are corresponding with and obtaining reports from manufacturers without regard to the question of whether they are or are not members of the association. The committees are termed "group" committees and in every instance regard themselves as serving to centralize the activities of all of the productive capacity of groups within the industry in order that this entire capacity may be made available to the government without loss of time or effort on the part of the federal authorities.

GRAVE POWER SHORTAGE IN NEW JERSEY PLANTS

Public Service Electric Company, on a "Hand-to-Mouth" Basis of Coal Supply, Has to Cut Service Radically

As a result of coal shortage the Public Service Electric Company, Newark, N. J., is able to operate generating stations at only about 50 per cent of capacity. It is on a "hand-to-mouth" basis of coal supply. Facing absolute shortage of energy to meet requirements of its power customers, the company created a zone system under which partial service is given.

Power customers receive service from 7 a. m. to 4 p. m. on Monday, Wednesday and Friday in the Essex and Bergen divisions and on Tuesday, Thursday and Saturday in the Hudson, Passaic and Central divisions. The Southern division, in the district around Camden, is not affected now by these restrictions. In the other divisions named the company tries to meet the normal requirements of power customers in accordance with the schedule of days indicated.

The company has also reduced the quantity of street lighting in the various communities served.

War's Effect on Cost and Quality of Service

Paper of Lynn S. Goodman and William B. Jackson, Presented Before American Institute of Electrical Engineers—Average Coal Cost Increase 100 per Cent—
Discussion in Boston and New York

A PAPER by Lynn S. Goodman and William B. Jackson on "Effects of War Conditions on Cost and Quality of Electric Service" was presented at an intersectional meeting of the American Institute of Electrical Engineers in Boston on Jan. 8, in New York on Jan. 11, and in Chicago on Jan. 14. The paper was presented under the auspices of the committee on the economics of electric service.

The employment of women has enabled electric utilities to obtain an additional class of labor at a relatively low rate, but when women take the places of men more women employees are required than the number of men replaced, and the war conditions tend to exhaust the supply of even this class of labor by offering wider fields of employment. The necessity for female labor to become more nearly self-supporting during war times further tends to increase the female wage scale.

It is recognized that the labor cost to public utilities will further advance either by increases in the direct wage or by some system of war additions such as are being employed by the other nations at war. This system of war additions is generally recognized as a measure to compensate for the temporary increases in living costs during the war period and is adopted principally in order to facilitate the ultimate return to normal conditions. By normal conditions is meant the conditions which would have been attained normally had war conditions not intervened.

From 1902 to 1912 the average wages per employee (exclusive of general officers, managers and superintendents), according to United States Census statistics, increased 11 per cent. During the war period thus far salaries of officers, managers and general superintendents in general have not increased greatly, but increases in wages in operating departments have ranged from 15 to 50 per cent, and Messrs. Goodman and Jackson are of the opinion that 25 per cent may be taken as the average increase thus far occasioned by the war. The increase in wages of 25 per cent means an estimated outlay of \$19,000,000 for the year.

The draft on men for government service and the war scale wages in industrial fields mean cost for training new operatives, and the continual change has also an effect on economy of operation and quality of service.

On the average, the authors conclude, the cost per ton of coal to electric companies has increased a little more than 100 per cent on account of war conditions. A conservative figure for the increase in tonnage due to lower quality and non-uniformity of grade is 10 per cent, making a total increase of \$60,000,000 on top of the estimated expenditure of \$50,000,000 had normal conditions prevailed in 1917.

It is estimated by Messrs. Goodman and Jackson that the increase in cost of materials and supplies other than fuel is 75 per cent, or \$30,000,000. In many cases the necessity or advisability of retaining present equipment in service until change is imperative introduces an element of reduced economy.

Protection of plants adds to cost of service an estimated \$2,000,000 or \$3,000,000. Normal taxes might have been \$25,000,000, but it is guessed that the increase above this will be, say, \$7,500,000.

The total of \$116,500,000 thus indicated is a quarter of the normal estimated gross revenue for 1917. It wipes out two-thirds of the sum that would have been available for interest, dividends and surplus. Messrs. Goodman and Jackson conclude that it puts the electric companies in a critical position.

Reviewing other considerations, the authors say that the advantages of the central station are so large that it is advisable for the government to use every reasonable means to encourage the central-station companies and discourage individual power plants during the war period.

One phase is improvement in load factors arising from putting less essential industries on an off-peak basis and the fact that war industries give an exceptionally long home demand.

Coal clauses, adopted by many companies, are regarded as only a partial remedy as the increase in cost for coal is only about one-half of the total increase in cost due to war conditions. Extension of the central station into the field served by isolated plants and especially the acceptance of temporary or auxiliary loads carries the menace that the central utility will be burdened with unused and abnormally expensive station capacity at the end of the war period.

Discussion at the New York A. I. E. E. Meeting

In opening the discussion E. W. Rice said that while the Goodman and Jackson paper paints a somber picture it presents a definite problem to engineers. With a problem well stated the solution is half found.

The grave fact that the New York Central Railroad came within three hours of having to suspend service for lack of coal should bring home to every one the necessity of conserving fuel, said Colonel Arnold. Every central-station company is doing what it can in this direction. Additional help can be afforded by electric service companies, through the consent of public utility commissions, by curtailing the amount of energy supplied to other than essential industries and by serving munition plants and other industries necessary to the conduct of the war to the maximum of their facilities. Industries which would suffer seriously by having their energy supply curtailed could be served during off-peak periods. By classifying different loads central stations could so group and serve these industries that their demands would overlap to better advantage and give better load factors. Thus the maximum use of equipment could be secured.

Pooling of generating and transmission facilities would also greatly relieve present difficulties, it was pointed out, as loads could be carried on the most economical generating equipment, less reserve capacity would be required, and advantage could be taken of

diversity factors, thus reducing peak loads, etc. Where exhaust steam can be used throughout the year there is an advantage in isolated-plant service. Otherwise it is generally cheaper to buy central-station power.

VALUE OF WATER-POWER DEVELOPMENT

Philip Torchio pointed out that it is inequitable for public utilities to be required to furnish service at the same rates as in normal times when other industries are allowed to increase prices to cover increased expenses. Referring to the shortage of coal and the necessity of conservation, he stated that if all of the water power east of the Rocky Mountains (*i.e.*, one-third of the total) were developed, 50 per cent of the coal used for primary power could be replaced. However, even after all water power is developed there will still be need of coal for generating purposes; therefore steam stations will be a permanent factor in the national development. If all stations in the country could be brought to the stage of development which some of the modern ones have reached, four times as much energy could be developed per pound of coal. In other words, a considerable saving could be realized by carrying loads of the inefficient plants in modern systems. Referring to the effect of war conditions on cost of operating electric utilities, Mr. Torchio said that in New York the total cost has increased 50 per cent, while the operating cost has increased 95 per cent. In concluding his remarks, he read a forecast he made ten years ago regarding the necessity and advantages of a nation-wide network of electric service lines.

HANDICAPS UNDER WHICH CENTRAL STATIONS LABOR

Major Betts referred to steps taken by the New York companies several years ago to obtain emergency service from each other. The wisdom of such arrangements in every locality was demonstrated lately in New Jersey, where several water companies had to depend on one company for supplying service.

Referring to the handicaps under which central stations have to meet increased demands for energy, Major Betts pointed out that the cost of labor has increased phenomenally, that help is uncertain and of a shifting nature, and that coal deliveries are slow if forthcoming at all. Owing to the latter cause and the inability to get additional generating equipment, the New Jersey company has had to cut off 40 per cent of its power load, causing cessation of many necessary industries and throwing many employees out of work.

The vital problem is to keep industries going, not only because the products of many are essential, but because employment depends on operation of factories. The uses for coal should therefore be classified and preference given to those which have essential products and a large number of employees. In justification of this priority list, Major Betts pointed out that there is just as much reason why power supplied to certain industries should be curtailed as there was that the draft law be put into effect. In view of this necessity central stations should take steps to acquaint present and prospective consumers with uses of energy which inure to the nation's interests.

W. S. Dorcess spoke of the effect of present conditions on the cost of power, calling attention to the inefficiency and changing nature of labor, its higher cost, the necessity of having to shorten working periods, the

higher prices of materials and supplies, including fuel, and larger losses due to use of lower-grade fuels. He estimated that the average price of all labor in central-station service has increased 30 per cent, that repair materials have increased as much as 90 per cent, and that the average price of fuel has increased 65 to 70 per cent (over 100 per cent in some cases).

H. M. Hobart said that while it was formerly impossible to secure some large loads unless the price of energy was brought lower, the war has forced them to apply for central-station service. Furthermore, war conditions have made all plants operate more economically and with least reserve equipment.

RELATION OF CENTRAL STATION TO WAR PROGRAM

Prof. D. C. Jackson said that the success of the war depends on the rate of industrial production rather than on any particular implement of warfare. For this reason the central station is eminently important, as it furnishes the quickest means of speeding up production. National authority should take this into account, he said. Labor shortage in the electric service field is due to distribution of labor rather than to actual shortage of men. The solution to this difficulty is to adapt the labor of which there is a surplus to the trades in which there is a scarcity of help.

In the absence of Mr. Bartlett, who presented a written discussion, Mr. Jackson read the paper, which contained observations on turn-over of labor. Statistics showed that in one case this was as great as 211 per cent. The reasons attributed for this were varying remuneration, men enlisting for military service, difficulty of filling positions, and unsettled labor conditions. Competition in securing labor was emphatically discouraged. Reference was made to one executive who said he could operate with women except in positions requiring manual labor. To hold men it was urged that the department heads get closer to the hearts of their men.

PRESENT COSTS AND RATES

F. A. Bryan brought out that, owing to the high cost of fuel, customers who formerly used isolated plant power have demanded central-station power. This means that the steam plant that had been held purely as reserve for his hydroelectric plant has had to be brought into regular service, thus requiring fuel at the present very high cost and materially increasing operating expenses and necessitating early additions and extensions. The question was raised whether the managers of electric properties are justified in taking on such additional business in the light of the very high cost of plant equipment and extensions and the high price of labor, fuel and supplies, unless they can have some assurance that these conditions will be taken into consideration by regulatory bodies both as they affect the present costs and as they affect them for the period succeeding the war.

F. G. Hudson stated that the regulatory bodies should appreciate the necessity of higher rates in the conditions under which utility corporations have to operate. In view of the increasing operating cost, it would be precarious and unwise to ignore the necessity for effectively working out the serious problems now presented. Certain partial solutions were suggested. Mr. Hudson also advocated the consideration by proper authorities of arranging some plan whereby skilled

workmen may be retained in positions for which they are best fitted, to the end that satisfactory service may be maintained.

Mortimer Freund said that while the central station is of prime importance, especially now, the individual power plant should not be discouraged so long as every effort is made to fulfill heat, light and power requirements with the least possible fuel waste. He discussed several situations where he considers the private power plant can supply electric service economically, and suggested the possibility of co-operation between private plants and central stations in supplying energy.

Discussion at the Boston A. I. E. E. Meeting

N. J. Neall, Boston, consulting electrical engineer in the building of the Ayer (Mass.) cantonment, said that the price per kilowatt-hour had not been increased materially to the public. He doubted whether the utility financial return situation was so serious as the authors contended. The remedy lay in rate increases. Net loss of revenue applicable to dividends could not be appraised fully until the effect of increased power rates was seen. Unless ordinary demands for service were financed as the need was met, the utility would hardly be in the position of being under obligation to meet such demands.

Mr. Neall suggested pooling coal distribution by utilities. Possible gains in economy of utility service lie along such lines as more economical use of coal, burning poorer grades of coal, substitution of other metals for present standard material, use of booster transformers in place of copper on certain distribution circuits, location of plants at mines and development of water power, with consolidation and interconnection of systems. Cultivation of off-peak loads is important, and non-essential industries might help by running lights and staying off the peak.

Prof. C. A. Adams, Harvard University, emphasized the efficiency decrease in plant operation due to coal high in ash. Ten per cent, he held, was a great underestimate of the decrease in economy in central stations resulting from poor fuel. Twenty per cent ash occurred in some cases. This meant larger stand-by losses, since more boilers must be held on the line than with good coal. Slate and stone in coal might increase consumption 30 per cent. The number of boilers for a given load might increase by 40 per cent in some cases.

GREAT IMPORTANCE OF CONTINUOUS SERVICE

Joseph Sachs, Westinghouse Electric & Manufacturing Company, Pittsburgh, cited the great importance of continuous service in munition plants. Some action should be taken by the government or others so that maintenance needs of central stations would not be overlooked by manufacturers. Where electrical material is being pushed into the background because plants are producing munitions on a large scale, there is danger that breakdowns may be protracted by shortage of needed supplies. This situation obtains in Germany. Night work by non-essential plants is now being practiced in Pittsburgh. The speaker thought the chances of increasing central-station efficiency poor at present. The present problem is one of production without regard for money making, stated D. B. Galusha of Stone & Webster, Boston. If private capital cannot

furnish sufficient power, the government would have to do so. Mr. Galusha said that powdered fuel was being used successfully in one of the Western central stations of Stone & Webster where fuel oil could not be obtained on a satisfactory basis, or coal of a grade which could be burned on chain-grate stokers.

J. F. Vaughan, consulting engineer, Boston, pointed out the small percentage increase 1 mill represents on a 10-cent lighting rate as compared with a similar net advance in power charges.

B. A. Behrend, consulting engineer, Boston, objected strenuously to the policy, advocated in some quarters, of having central stations give poorer service.

Prof. D. C. Jackson, Massachusetts Institute of Technology, Cambridge, urged larger use of the central station on account of the reduced number of men required for a given output for installation, operation and supervision. The men at the front would be absolutely serviceless unless backed up by manufacturers having ample power supply. The speaker touched briefly upon the desirability of utilizing men trained in one trade in another trade in the off-season, such as converting bricklayers into sheet-metal workers during the winter. A prominent union official also favored this idea, Professor Jackson said.

AN "INDUSTRIAL LEGION"

The need of a sane return to investors, of an increased number of off-peak customers, and the tendency of the isolated plant to reach a more critical position, were emphasized by Prof. R. G. Hudson, Massachusetts Institute of Technology, who also stated his belief in the establishment of an "industrial legion" with appropriate insignia for those helping the country's war work at their posts in power plants, etc.

A written discussion submitted by W. S. Gorsuch, New York, analyzed the effect of increased wages, reduced working hours, inefficient labor and increased coal cost upon unit generating expenses. In many cases, he held, inefficient labor was paid more now than better men received before the war. The cost of a large portion of power-plant labor had increased from 30 to 55 per cent. Present increased wages were liable to remain after the war, but doubtless more efficient labor will be available. Repair parts in some cases are 90 per cent more costly than previously, discouraging maintenance work. With detailed figures, the writer showed that if any corrections or increases are made in rates to cover increased cost of coal, they should be made on the basis of B.t.u. per dollar and not on the increased cost of fuel per ton.

Mr. Gorsuch stated that the recent rise in labor and material costs had increased operating expenses at a rate much faster than any possible economy resulting from increased load factor. The question whether it was worth while for some small companies to generate their own energy or purchase it from an ample source was purely an economic one, he said. To illustrate this, consider two plants, one having a maximum load of 40,000 kw. and a 45 per cent load factor and the other a maximum load of 10,000 kw. and a 25 per cent load factor, with non-simultaneous peaks. In a typical case the load curve of the smaller plant was superimposed on that of the larger, with a resulting diversity in power-station demands of 5000 kw. and a reduction in the cost of generation.

Nation Needs Men for Searchlight Regiment

The Fifty-sixth United States Engineers, Now Being Organized, Offers Opportunity for Young Men with Electrical Experience or Fundamental Knowledge of Electricity and Mechanics for Special Service Abroad

AN EXCELLENT opportunity is being offered to young men possessing a knowledge of electricity and mechanics, as well as to experienced electricians, gas-engine operators and machinists, to serve the government effectively in its fight for democracy. The War Department is organizing a regiment of searchlight companies for special service abroad. These units will be highly specialized and used for battle illumination and anti-aircraft protection. The companies will be armed and equipped as regular military units and will form part of the regular army organization. They will be called upon for extremely active work in the war zone, and pains are being taken in the selection of the personnel of the companies.

In special cases men of proper experience who already have been drafted into service may be transferred. In order to obtain those of suitable qualifications, a special ruling will permit men within the draft age but not yet called to be inducted directly into this regiment. The plan is to obtain bright, young, intelligent and ambitious men who possess a fundamental knowledge of electricity and mechanics, as well as trained and experienced electricians, gas engine operators and machinists. The enlisted personnel will embrace men experienced in one or more of the following occupations: Electricians, gas-engine operators, machinists, motor-truck drivers, blacksmiths, horseshoers, mechanics and general all-around utility men.

Men must first enlist as privates and will be paid \$30 per month, together with food, clothing, medical attention, etc. Non-commissioned grades will be available at rates of pay from \$36 to \$96 per month, and future promotion is open to those of ability.

Specialized service of this character offers unusual opportunities for those capable of performing it. The character of the work will be highly interesting and varied. The man who has the necessary training and ability cannot serve his country better than by joining such an organization.

The war as it is now being fought offers great opportunities for the use of searchlights for defensive as well as for offensive operations. Among the uses of projectors on the battlefield are the following:

To discover and keep in touch with the movements of the enemy during the night.

To seek out and illuminate hostile objectives, so as to fire upon them.

To blind the enemy.

To illuminate roads and possible hostile positions in the more distant foreground periodically by the light.

To search the near foreground.

To support fire effect by illumination of hostile targets.

To disturb hostile works by alternate blinding and turning on the beam or by working the beam back and forth.

To blind opposing searchlights.

To support attacks in the foreground by throwing the beam in front of the advancing troops and screening their movements.

To reveal obstacles to their own artillery, which is thus enabled to destroy the obstacles.

To blind the enemy and disturb his forward march and firing capacity and confuse him by making him think his plans are discovered.

To facilitate the landing of aviators at night.

For anti-aircraft work and night-bombing defense.

The foregoing summarize the general activities of this new regiment. Information may be obtained by writing directly to the commanding officer, Fifty-sixth United States Engineers, Washington Barracks, D. C. The applicant must give the following information: (1) Name, (2) address, (3) age, (4) married or single, (5) nationality, (6) whether he will enlist for the period of the war, (7) brief statement of education, (8) present occupation, (9) experience, (10) name and address of present or former employer, (11) whether or not the applicant has been drafted.

Cleveland Rate Case.—F. W. Ballard, employed by the city of Cleveland as expert in its contest before the Ohio Public Utilities Commission with the Cleveland Electric Illuminating Company, has written a review of the case which is to be published in a magazine in February. Copies of the review, however, have been sent to Governor McKim, the utilities commission and the Cleveland Engineering Society. Mr. Ballard is preparing an argument against the valuation to be presented to the commission. The order as to the valuation has been appealed to the Ohio Supreme Court. Unless this court should nullify the order, the rate will be based upon this valuation and the ordinance would thus be rendered void.

Autonomic Electrical Troubles.—That conditions in the German and Austrian electrical industries are not so rosy as reported dispatches seem to indicate is shown in occasional quotations from financial reports to stockholders of electrical concerns. The following is from a report issued to stockholders by directors of the Austrian Siemens-Schuckert works: "It is true that these works operated at full capacity, but nearly half of the work is done for the War Department, which precludes the charging of profitable prices for our products. It must also be remembered that while wages, materials and overhead expenses are rising continually, the productive capacity of such employees as we can obtain is gradually sinking lower and lower. Under these conditions profits and dividends are unlikely."

Postponement of "Anti-Trust" Cases.—In petitioning the United States Supreme Court to postpone the hearing of "anti-trust" cases until the next term, Attorney General Gregory gave the following reasons for his request: "The order that the government in this time of stress may not meet with competition from private enterprises in its financial operations and the flotation of loans, the Treasury Department has been constrained to urge that all private financing on a large scale shall be delayed so far as at all possible. Thus, in its annual report on the finances for the fiscal year ended June 30, 1917, the Secretary of the Treasury makes the following observation: 'The government must, if necessary, absorb the surplus of new capital available for investment in the United States during the period of the war. This, in turn, makes essential that unnecessary capital expenditures should be avoided in public and private enterprises.' It is quite probable that the dissolutions which are sought in the pending cases against the United Shoe Machinery Company, International Harvester Company, United States Steel Corporation, Eastman Kodak Company, American Can Company, Borden Oats Company and Corn Products Refining Company will require financial operations on a large scale if they are to be genuine and effective. As important as the remedy sought in these cases is believed to be, it must be delayed for the moment to the paramount needs of the hour."

Current News and Notes

Timely items on electrical happenings throughout the world, together with brief notes of general interest.

Electric Shop Discontinued.—The Commonwealth Edison Company original electric shop, Jackson and Michigan Boulevards, Chicago, which was operated for nine years from January, 1909, was discontinued on Jan. 1, 1918. George B. Johnson, manager of the shop, has been transferred to the contract department. This electric shop was one of the best known in the country and has been visited by many thousands of persons in the electrical industry interested in modern ideas on electrical merchandising.

Chicago Sanitary District Seeks Plan to Get More Water from Lake Michigan.—The Sanitary District of Chicago has passed an ordinance tendering \$475,000 to the United States. In return the Sanitary District expects to get an unqualified permit, by act of Congress, for the immediate use of 520,000 cu. ft. of water a minute from Lake Michigan, with provision that additional water may be withdrawn, up to 720,000 cu. ft., as the population of Chicago increases. The latter figure is the maximum that can be handled by the channel and works as at present constructed. If the federal government accepts this offer, it is expected that the \$475,000 will be expended by it in building compensating works in the St. Clair and Niagara Rivers to preserve water levels which it is said would be lowered if the Sanitary District were permitted to take the additional flowage. The proposed compromise is based on the report of federal engineers, of whom Gen. William M. Black, now chief of engineers in the United States Army, was the senior. This report was made on account of a federal lawsuit intended to limit the Sanitary District to the use of 250,000 cu. ft. of water.

The J. E. Aldred Lectures.—Through the generosity of J. E. Aldred there has been founded in the department of engineering of Johns Hopkins University, Baltimore, a course of lectures on engineering practice. The course of lectures is one feature of a general plan, made possible by Mr. Aldred's gift, for furthering and improving undergraduate instruction in the methods and problems of the practice of engineering. The lectures will deal, therefore, with the practical phases of engineering problems rather than with theory. They are not expected to discuss new and striking applications as much as to deal with every-day working methods of design, construction and operation. During the year three lectures each will be given upon the general subjects of civil, electrical and mechanical engineering. They will be given on Wednesday evenings at 8 o'clock in the auditorium of the Civil Engineering Build-

ing of the university at Homewood. The lectures are open to the general public. A partial list of the lectures follows: Jan. 16, "Steam-Electric Power Plant Design," A. S. Loizeaux, electrical engineer Consolidated Gas, Electric Light & Power Company, Baltimore; Jan. 30, "The Relation Between Civil Engineering and Military Engineering," Major-General William M. Black, chief of engineers, U. S. A., Washington; March 6, "The Growth of Electric Systems," Julian C. Smith, vice-president Shawinigan Water & Power Company, Montreal, Canada; March 13, "Coal and Its Combustion in Boiler Furnaces," E. G. Bailey, president Bailey Meter Company, Boston.

Underwater Section of Halifax Power Cable Survives Explosion.—In the explosion at Halifax, N. S., on Dec. 6 service was interrupted on a 13,200-volt transmission circuit by which the Nova Scotia Tramways & Power Company supplied energy to the suburb of Dartmouth, on the east side of Halifax Harbor. The overhead section of this line was illustrated in the ELECTRICAL WORLD of Dec. 15, 1917, page 1162. Since the visit of the representative of this journal to Halifax it has been learned from H. R. Mallison, managing director of the company, that the submerged portion of this circuit sustained no damage. The underwater section consists of 2800 ft. of three-conductor, No. 4 R. & S. stranded rubber tape and varnished-cambic insulation, jute fillers, varnished-cambic belt, lead sheath, jute bedding and No. 4 B. W. G. wire armor, designed for 15,000 volts working pressure. This portion of the cable was laid in two sections, the joint being approximately in the middle of the harbor and well within the explosion zone. The shore-end sections consist of about 600 ft. of three-conductor No. 2 B. & S. gage, stranded, of the same general construction as the submarine section. These shore sections are joined to the submarine section at approximately the shore line and continue underground to the terminal pole, where they are connected with the aerial lines. The explosion damaged the pot-heads on the shore poles on each side of the harbor and they had to be replaced. In underrunning the submarine cable for inspection a 5-ton anchor was discovered firmly fixed to the cable; but the anchor had been there prior to the explosion and apparently caused no damage to the cable at the point of contact, although it is apparent that the anchor lifted the cable to the surface before it was cut away and drew the cable very tight from the east shore of the harbor. In grappling for the cable a large amount of wreckage was found, including piles, timbers and fragments of iron presumably blown into the water from the ship Mont Blanc. The cable was found completely covered with a tar-like substance such as smeared survivors from the explosion who were in the vicinity. Temporary service to Dartmouth pending repairs to the transmission line and pot-heads has been supplied from the plant of the Woodside sugar refinery.

Max Thelen was re-elected president of the Railroad Commission of California at the annual meeting of the commission on Jan. 2. This will be President Thelen's fourth term as head of the commission.

O. S. Yager has resigned his position as assistant to general manager of the Logan County Light & Power Company, Logan, W. Va., to become municipal superintendent of the city of Eaton Rapids, Mich.

P. M. Richards, formerly superintendent of the city light and water plant of Metropolis, Ill., is now associated with the Chuse Engine & Manufacturing Company at Mattoon, Ill., in the capacity of erector on outside work.

J. H. Kracke, formerly commissioner of plants and structures in the city government, has succeeded Col. William Hayward, now in military service, as a member of the Public Service Commission for the First District of New York.

A. D. Johnson, formerly Cambria representative for the Wisconsin Power, Light & Heat Company, has been appointed division superintendent for the company, with headquarters at Portage, Wis., succeeding F. M. Nourse, who has accepted a position in Chicago.

J. H. DuFresne has resigned as auditor and assistant treasurer of the Choctaw Power & Light Company, McAlester, Okla., to become auditor of the Minneapolis General Electric Company, Minneapolis, Minn. Mr. DuFresne was also chairman of the auditing and accounting committee of the Gas, Electric and Street Railway Association of Oklahoma.

Capt. Edwin W. Moore, chief senior aide to Major-General John F. O'Ryan, commanding the Twenty-seventh Division, U. S. A., besides being president of the Bare Wire Company, as stated in the Jan. 5 issue of the *ELECTRICAL WORLD*, is president of the Habirshaw Electric Cable Company of Yonkers and the Electric Cable Company of Bridgeport.

Van Dusen Rickert, who early in October resigned as assistant general manager and assistant secretary and treasurer of the Eastern Pennsylvania Railways Company and assistant general manager and secretary and treasurer of the Eastern Pennsylvania Light, Heat & Power Company, to take effect when a new general manager was appointed, severed his connection with these companies Dec. 31.

James E. Davidson, vice-president and general manager of the Nebraska Power Company of Omaha, Neb., is the new president of the Nebraska Section, N. E. L. A. Mr. Davidson was formerly with the public utility companies at Port Huron, Mich., and served as secretary-treasurer of the Michigan Electric Association. Later he became president and manager of the Consolidated Lighting Company of Montpelier, Vt. He was president of the Vermont Electrical Association in 1909 and president of the New England Section of the National Electric Light Association in 1910-1911.

Men of the Industry

Changes in Personnel
and Position —
Biographical Notes

W. D. Clark has succeeded R. S. Dunning as secretary of the Cleveland Electric Club, Jovian Chapter.

E. H. Merrill has been appointed chief engineer of the Galesburg (Ill.) Railway, Lighting & Power Company to succeed L. N. Jenkins.

L. N. Jenkins has resigned as chief engineer of the Galesburg (Ill.) Railway, Lighting & Power Company, to take a position in Omaha, Neb.

Michael Condon, Orange, N. J., has been named engineer for the municipal power plant, Orange, by the City Commission, to succeed James McElroy, deceased.

Guy E. Tripp, heretofore chairman of the Westinghouse Electric & Manufacturing Company, has been appointed head of the division of production in

G. E. TRIPP

the ordnance department of the United States Army. He has already entered upon his duties, and the board of directors of the Westinghouse company has given him a leave of absence for the duration of the war.

E. A. Baily, secretary to the vice-president of the Edison Electric Illuminating Company of Brooklyn, is now in Washington, D. C., for an indefinite period, where he is associated with the section on national organization of the war savings committee of the United States Treasury Department. Through this committee the government placed on sale on Dec. 3, 1917, \$2,000,000,000 of war savings and thrift stamps. Mr. Baily is devoting his time in interesting public utilities, including electric lighting, natural and artificial gas, water and street railway companies, in establishing booths for the sale of the new thrift and war savings stamps.

R. S. Dunning has resigned as secretary of the Cleveland Electric Club, Jovian Chapter, and is engaged in sale promotion work with the Forest City Rubber Company of Akron, Ohio. Under Mr. Dunning's secretaryship the Cleveland Electric Club was noted for the interest of its members and for the activities of the organization.

William Marconi, the inventor of the Marconi wireless system, has been appointed Italian high commissioner to the United States. Last spring Mr. Marconi, who is an Italian senator, was a member of the Italian commission which visited the United States. On his return from this country to Italy he served on the staff of General Diaz, the Italian Commander in Chief, giving special attention to the wireless system at the front.

Charles R. Underhill, chief electric engineer of the Acme Wire Company, New Haven, Conn., has just been appointed captain in the Aviation Section of the Signal Reserve Corps. Mr. Underhill, who has been with the Acme company since the summer of 1911, the inventor of a number of signal and wireless-telegraph devices besides being the author of a work on electromagnetic winding in which a number of original formulas are given.

F. Emerson Hoar, for five years head of the gas and electric department of the Railroad Commission of California, is leaving for Petersburg, Va., for three months' training as a captain in the Engineers' Corps. Mr. Hoar, who was born forty years ago in Kern County, California, served during the Spanish American War with Company I, First California Volunteers, the regiment which took Manila. After the war he remained at Manila two years, working there as a civilian in engineering work. It is with the greatest reluctance that the Railroad Commission releases Mr. Hoar from his present important work, which includes investigation of the feasibility of interconnecting transmission line systems of the State and otherwise conserving fuel and power generally. Within the past year Mr. Hoar has had charge of very important studies in connection with oil resources, industrial power rates and, in fact, many of the larger problems brought before the commission in which gas and electric utilities are involved.

Obituary

Charles J. Klein, inventor, connected with the push-button specialties department of the Cutler-Hammer Manufacturing Company, Milwaukee, Wis., was stricken with apoplexy on Dec. 3, at the age of fifty-five years, death resulting. Mr. Klein was born in New York City and had been connected with the electrical industry in its early stages, having been associated with Mr. Edison in the installation of the first electric station in New York City. A number of products have been developed by the Cutler-Hammer company from the patented push-button mechanisms devised by Mr. Klein.

Associations and Societies

A complete Directory of Electrical Associations is printed in the first issue of each month on the next-to-last text page.

Electrical League of Cleveland.—Mrs. C. S. Hoover addressed the Electrical League of Cleveland on Jan. 10 on the subject of "The War Work Done by the Daughters of the British Empire."

Empire State Gas and Electric Association.—The electric section of this association held a meeting on Jan. 18 at Rochester, N. Y., to discuss war economies, interconnection of systems and transformer loads.

Indiana Engineering Society.—The thirty-eighth annual meeting of the Engineering Society will be held at Indianapolis Jan. 25. The meeting, instead of being a three-day affair as usual, will be a one-day meeting with three full sessions. Separate meetings for different branches of engineering will be held. Charles Brossman, Indianapolis, is secretary of the society.

Fifth National Foreign Trade Convention.—The Fifth National Foreign Trade Convention will be held April 18 to 20 in Cincinnati, the convention theme to be "The Part of Foreign Trade in Winning the War." A tentative list of topics to be discussed at this meeting is as follows: "After-War Conditions of Foreign Trade," "Exports Control and Imports Control," "Foreign Credits," "Education for Foreign Trade," "The Smaller Manufacturer and Merchant," "Getting Into the Game" and "The Merchant Marine." Delegates are urged to advise, in writing, the secretary of the National Foreign Trade Council, 1 Hanover Square, New York City, what group sessions they desire to participate in, specifying the phase of the subject in which they are interested.

Meeting of Brooklyn Company Section, N. E. L. A.—At the Jan. 15 meeting of the Brooklyn Company Section of the National Electric Light Association the chief speakers were W. H. Wells, advertising manager; W. F. Wells, vice-president and general manager, and T. I. Jones, general sales agent of the company. Mr. Jones' paper formed the chief topic of discussion for the evening. He reviewed briefly the sales activities of the Edison company for the year 1917, showing the results in curves. During the year 1917 a change was made in the sales policy of the Edison company, particularly with reference to incandescent lamps, and the new policy was outlined by Mr. Jones. Among the visitors were a number of prominent central-station executives and manufacturers' representatives in the district. Short addresses were also made by C. G. M. Thomas, treasurer of the Consolidated Gas Company of New York; Adam

Page of the Harrison Lamp Works of the General Electric Company; D. F. Atkins, electrical engineer, Department of Water Supply, Gas and Electricity; W. J. Clarke, vice-president Westchester Lighting Company, Mount Vernon, N. Y.; O. H. Caldwell, *Electrical Merchandising*, and H. H. Barnes, engineer of the New York office of the General Electric Company.

Electric Club-Jovian League.—Capt. Charles E. Marian, chief examining officer for the Chicago district of the aviation department of the Signal Corps, addressed the Electric Club-Jovian League on Jan. 10. Announcement was made that the club's committee chairmen for 1918 are: R. I. Phillips, finance; E. A. Rummeler, speaker; J. G. Harvey, entertainment; Norman F. Obright, reception; C. W. Pendell, attendance; George C. Keech, welfare; E. S. Butt, publicity; W. H. Coleman, permanent quarters; William P. Bear, war activities, and J. R. Cravath, civic committee.

New York Electrical Society.—Continuing the war series of meetings that have been running during the winter, the New York Electrical Society announces another of timely interest for Jan. 24 to be held in the Engineering Societies Building at 29 West Thirty-ninth Street. On this occasion the address will be "The Telephone in the World War." It will be delivered by H. J. Carrol of the New York Telephone Company's lecture bureau. The membership committee, under the chairmanship of Walter Neumuller, is engaged in a campaign which has secured more than 150 members.

Contractors and Jobbers Hold Meeting in St. Louis.—A meeting was held jointly by the co-operative committee of the St. Louis Electrical Contractors, Jobbers and Dealers and the Missouri State Association of the National Association of Electrical Contractors and Dealers in St. Louis on Jan. 5. Beginning with the morning session, the following chairmen of standing committees delivered reports: Industrial development, Gus Schwedler of the Sparks Electric Company, Kansas City; universal data and sales book, O. L. Fickie of the Union Electric Company, Kansas City; liability insurance, W. L. Hutchison of the Kansas City Electric Construction Company; merchandising, J. J. Magee. In the absence of E. L. Heath, chairman of the credit committee, W. J. Burton of the Frank Adam Electric Company, St. Louis, presented a paper on "The Value to the Contractor of Trade Acceptances." The time being limited, the following committees were unable to report: House wiring, Robert B. Randall, chairman; jobbers, W. A. Koeneman; central stations, George Gamp; architects and engineers, W. J. Sutter. These additional committees were created: Unit prices, Edward Allison of the W. A. Corrao Electric Company, St. Louis, chairman; also standard forms and accounting and standard costs, with the selection of chairman deferred.

Commission Rulings

Important decisions of various state bodies involving or affecting electric light and power utilities.

Continuous Service Rate.—The Pennsylvania Public Service Commission, in a case affecting the Butler Light, Heat & Motor Company, holds that when a company purchasing electric power from a power company must have continuous service and cannot bring itself within those provisions of the schedule of rates of the power company limiting the service to off-peak hours, it cannot demand the off-peak-hour service rate but must pay the continuous service rate.

Providing Working Capital.—Working capital is considered by the New Jersey Board of Public Utility Commissioners in a case affecting the Tintern Manor Water Company, the decision declaring: "It may well be that a company is required to borrow money in order to finance its operations, but this fact alone is not clear evidence that an allowance of working capital should be made. Where bills are payable entirely in advance at the beginning of the year, the money required to operate the company for the year is deposited to the credit of the company and may be actually increased, owing to interest on bank balances."

Method of Accounting for Service.—The method of recording messages used by the New York Telephone Company—having the operator press an electric button connected with a recording machine as soon as a call has been completed—was found by the New York Public Service Commission, Second District, to be as nearly accurate as any registering system which depends in any degree upon the accuracy of the people operating it. "So far as the commission has been enabled to observe," the decision says, "the company has always tried to avail itself of the best appliances that are to be had and to maintain a high standard of efficiency in the conduct of its business. Its failure to give entire satisfaction in connection with the matter now under discussion has not, in the opinion of the commission, been due to any desire upon the part of the company to maintain a registering method that is only partially satisfactory for one minute longer than seems necessary for the good of the system as a whole. If the commission did not believe that this was so, it would regard the condition of which Dr. Tracy [the complainant in the case] complains as intolerable, and would be willing to go to almost any length in compelling the company, at whatever cost, to rectify it immediately. Believing it to be so, it feels that this whole matter can be allowed to rest where it is for a while longer, until some better solution presents itself."

TRADE & MARKET CONDITIONS

News of the Trade for the Manufacturer, Wholesaler and Jobber
of Electrical Equipment and Supplies—
Notes on Industrial Activities and Business Methods

SEPTEMBER ELECTRICAL

EXPORTS COME TO \$4,190,110

The Large Amount of \$773,217 for Insulated Wire and Cable Included in Figures for the Month's Total

During September last exports of electrical goods from the United States amounted to \$4,190,110, in comparison with \$3,491,217 in September, 1916. These figures included an item of \$773,217 for insulated wire and cable armament, which is particularly large for that trade.

Figures also show exports of electrical goods for the first nine months of 1917 to have been \$40,225,951, as compared with \$27,027,623 for the corresponding period of 1916 and \$17,239,950 for the corresponding period of 1915. From the figures for the first three quarters, it appears that the total for 1917 will be somewhat more than \$50,000,000. However, the shipping conditions of the fall months of 1917 were such that it would not be surprising if the figures for those months when disclosed should show a considerable falling off over the previous months of the year.

The following figures were compiled by the Bureau of Foreign and Domestic Commerce:

Articles	1916	1917	1916	1917
Batteries	\$157,051	\$187,665	\$1,331,054	*\$2,568,047
Carbons		96,297		336,180
Dynamos and generators	108,453	106,784	1,129,872	1,718,005
Fans	23,593	65,558	255,231	487,330
Heating and cooking apparatus		39,927		*85,396
Insulated wire and cables	513,946	773,217	3,012,318	5,491,054
Interior wiring supplies, including fixtures	71,840	64,713	646,624	929,764
Arc lamps	982	1,193	12,946	13,415
Carbon-filament lamps	7,541	6,948	71,570	138,317
Metal-filament lamps	86,539	205,793	1,066,637	2,013,975
Magnetos, spark plugs, etc.		239,724		*712,345
Meters and measuring instruments....	85,395	111,906	624,242	808,181
Motors	327,727	456,117	3,467,002	*4,586,287
Rheostats and controllers		4,882		*37,845
Switches and accessories		166,299		466,897
Telegraph apparatus, including wireless..	10,671	17,707	120,761	470,351
Telephones	69,933	106,758	1,217,793	1,495,245
Transformers	103,251	88,660	801,935	1,038,650
All other	1,924,295	1,450,962	13,269,638	16,828,667
Total	\$5,491,217	\$4,190,110	\$27,027,623	\$40,225,951

*Figures cover period beginning July 1.

THE GROWING SCARCITY OF SKILLED MECHANICS

Appliance Manufacturer Unable to Place New Line of Goods on the Market Owing to Labor Shortage

Added to the difficulty of obtaining an adequate and steady supply of raw material, such as aluminum, brass, copper, steel, etc., a manufacturer of vacuum cleaners and other household appliances states that the growing scarcity of labor is becoming a real menace. As yet no attempt has been made to train and introduce women into this plant, but as could be gathered it seems only a question of time. For example, where in one department the complement was twenty-five men—this is a moderate-sized factory—now four is the largest number that can be had; in another department, where fifteen men were employed, two now report for

work; in still another room, where ten skilled men were necessary, only one man is on hand. The manufacturer in question, in lamenting this state of affairs, remarked that there seemed to be no relief in sight.

With the rapidly diminishing staff of factory workmen—skilled mechanics in their respective lines—has come the rapidly advancing scale of wages. The munition plants are attracting the services of mechanics, especially metal workers, as in this case, by paying them three times the money a manufacturer of the kind referred to can afford if he is to market his specialties with any margin of profit remaining. The cost of production follows the various increases of wages, so that the danger point has been reached.

For some time this producer was, and he is yet, hoping to place on the market a new line of electrical goods. The raw material is assembled and ready to be put in process, but the labor is the "missing ingredient" that is blocking further progress. The entire force of the factory must devote its time to keeping his regular lines in shape, which leaves any expansion along new lines almost impossible. Just how many other plants are either ruefully contemplating a like condition or else already experiencing it a special investigation alone would determine.

THE VOLUME OF HEATING

DEVICE BUSINESS IN 1917

Gross Sales of All Companies Are Estimated by Competent Authority to Be \$5,000,000, Which Is \$1,000,000 Ahead of the Figures for 1916

An authority on heating-device sales, whose knowledge of the entire business is gained through close association with the resistance-wire patent control, has given the following data as the best obtainable on the field as a whole:

"Heating-device sales for the year 1916 were \$4,000,000 and for 1917 were \$5,000,000 at manufacturers' prices. This total volume was divided in the proportion of 60 per cent socket appliances and 40 per cent ranges and other devices. If it be assumed, as it may be conservatively, that \$5 is the average selling price per socket device and \$60 is the average price per range, it is apparent that 400,000 socket devices and 50,000 ranges and other devices were sold in 1917. The average connected load of socket devices may be taken at 660 watts. On this basis the sales of 1917 alone added to the lines of central stations 264,000 kw., or a demand which if produced simultaneously would amount to a peak five-eighths as great as the peak of the Commonwealth Edison Company in Chicago in 1917. A little further estimating, based on published data on heating device use (see ELECTRICAL WORLD, July 7, 1917, page 19), shows that this 264,000 kw. of connected load meant annually an energy consumption of 40,429,600 kw.-hr. At 5 cents per kilowatt-hour this means \$2,021,480 in central-station revenue. Likewise, with the electric ranges a 5-kw. average rating can be assumed, giving 200,000 kw. in ranges sold during the year, or more than enough entirely to load to its ultimate capacity the new Windsor (W. Va.) power house jointly owned by the American Gas & Electric Company and the Insull interests. The central-station revenue from these ranges will probably be not less than \$36 a year each, or \$1,500,000. In other words, there is no single electric light and power company in the world capable of carrying the total connected load which would be produced if all the heating devices, including ranges, etc., sold in 1917 were simultaneously connected to its lines. The importance of this fact is more appreciated when it is considered that heating devices in quantities nearly as large have been sold

for many years and are still operative. It should also be pointed out that each 1000 kw. of heating devices connected calls for its quota of boilers, turbines, generators, switchboards, feeders, substations, transformers, wire, meters and supplies. Thus the 464,000 kw. of heating devices of necessity made possible the sale of much other equipment. Of such sales the size of the item of meters alone is surprising, since a very large percentage of the 50,000 ranges necessitated the purchase of three-wire, 25-amp. meters. So, taken on the whole, the heating device business is not the 'piddling' little affair it is sometimes assumed, in ignorance, to be."

ELECTRICAL SUPPLIES

FOR THE GOVERNMENT

Bids Now Being Asked for Considerable Quantities of Wiring Equipment—List of the Desired Articles

Bids are being asked for by the General Engineer Depot, Washington, D. C., for furnishing a considerable quantity of electrical goods to the government. Proposals will be opened Jan. 21. The electrical goods which the government is calling for are listed in the following table:

600 lightning arresters, 1250-2500 volts.	400 linemen's slack tackle.
600 gapments for above.	3200 enamel hoods.
600 350-volt lightning-arresters.	1600 linemen's hatchets.
3000 guy anchors.	2200 hatchet handles.
60,000 galvanized cross-arm braces.	832,000 glass insulators.
480,000 malleable-iron wall brackets.	24,000 porcelain knobs.
60,000 oak brackets.	480,000 locust insulator pins.
600 linemen's tool belts.	555 kerosene fire pots.
1,200,000 unglazed porcelain cleats.	555 melting pots.
60,000 cut-outs.	80,000 connecting plugs.
6,000 galvanized guy clamps.	480,000 porcelain rosettes.
600 splicing clamps.	480,000 reflectors.
20,000 cable connectors.	800 wire reels on wheels.
48 fuse plugs.	3200 reducers.
48,000 inclosed fuses.	400 tube cutters.
200 lb. round fuse wire.	400,000 lb. friction tape.
600 fuse boxes.	9600 copper terminals.
2,000 fuse links.	36,800 cable taps.
90 wire grips.	1600 safety straps.
	769,600 porcelain tubes.
	480,000 sockets.
	160,000 snap switches.
	36,000 D. P. S. T. knife switches.

METAL MARKET SITUATION

Wire Is Following Base in a Downward Tendency—Lead, Brass and Aluminum Are Higher

No uneasiness is expressed by either manufacturing consumers or jobbers regarding the supply of copper. The metal is moving freely at the established price, and wire—bare, covered and weatherproof—is being shaded in price, according to reliable reports. When the transactions have seemed to warrant the reduction base was quoted as low as 28 cents and weatherproof at 26½ cents. The jobbing houses in some instances are speaking of the current situation, especially on wire, as a falling market; but prices remain fairly steady for usual requirements.

Lead has advanced, as well as aluminum. Old metals also effect an upward tendency, with brass following in the same way. Tin is still scarce; in fact, buyers are placing orders at the convenience of the market, with none offering.

THE WEEK IN TRADE

REPORTS from all sections indicate a brisk opening of trade so far in January. Shipments and deliveries continue to be disastrously affected by freight and express embargoes, with not much improvement in the transportation congestion at the principal terminal points. Business, however, is sound and increasing in volume. A few price advances have been made during the week, notably on friction tapes and electric sewing machines. Severe weather conditions have held up the supply of heating appliances, and an acute shortage in the large cities in the East has followed. In certain sections some kinds of conduit, as well as large and small motors, are scarce, with lamps still short. Building operations show some improvement, particularly where governmental activities along war lines exist. Financially the trade is reported to be on a sound basis, collections being generally mentioned as fair.

NEW YORK

During the past week considerable activity in the further receipt and sale of heating appliances was in evidence. The continued severe cold weather and record-breaking snowstorms in the Middle West have interfered greatly with shipments. The outlook for better and more certain deliveries, which seemed on the point of improvement, is now somewhat dubious. Revision in price to a 30-cent base of wire products is in progress. Collections have fallen off to a slight degree.

TIME SWITCHES.—Apparently a stronger demand is developing. A manufacturer who specializes on these goods says that while prices have not changed recently deliveries cannot be made under six months.

COLLECTIONS AND CREDITS.—January so far is making only a fair showing on collections, although no uneasiness is displayed by the jobbing houses and distributors. Jobbers state that not a few manufacturers are making liberal discounts for prompt and anticipated settlement of bills; in fact, far in advance of maturity. This practice is being followed right down the line to the dealers. The money is needed to finance current obligations.

SEWING MACHINES.—An advance of from \$2 to \$3.50 on certain types of electric sewing machines is reported as immediately effective. The supply of stock in the factories is said to be none too large, though no shortage is in sight.

RADIATORS.—The New York distributing and jobbing trade has not had its stock replenished. From reliable sources it is ascertained that shipments of these goods are in transit, but no one seems to know where they are or when deliveries may be reckoned on with any degree of positiveness. During the recent cold snap one of the largest distributing concerns in the East had one radiator in its showrooms, and four officers of the company endeavored to commandeer it for their personal use at home. Several jobbers stated that they could have sold from 500 to 1000 heaters readily if it had been possible to procure them.

GEARS AND PINIONS.—With the drawback incidental to uncertain deliveries, gears and pinions of standard grades are coming through in a fair way. Where new goods cannot be had unless subject to long delays, the second-hand market furnishes the supply quite satisfactorily.

FRICTION TAPES.—New prices are being quoted in certain quarters on friction tapes, effective Jan. 14, the change representing a sharp increase, ranging from 15 to 25 per cent.

PORCELAIN.—A slight betterment of conditions is noted in porcelain goods, shipments of which are moving as well as the embargoes in the East will permit. No recent differ-

ence in prices has been made so far as could be learned from local jobbers.

SOCKETS.—Where a few weeks ago the supply of standard sockets was regarded as approaching a shortage, now there is no trouble in getting stock. Prices have not been changed, but a revision is looked for.

CHICAGO

Two blizzards which have swept over the Central West this week have pretty effectually tied up the trade. There were very few shipments arriving at the jobbing houses. What is more disastrous is that for several days the drifts cut off shipments from jobbing houses to customers. On Saturday, Jan. 12, it was even impossible to get out express shipments because street traffic was deadlocked. Express companies flatly refused to send out wagons and trucks. Orders have continued to come in, however, and in some quarters the comment is heard that in spite of the severe weather business for this season of the year is fair. Especially with industrial companies business remains good.

COPPER.—As was predicted last week, rubber-covered copper wire is down to a 30-cent to 32-cent base. Weather-proof wire can be bought as low as 28 cents. It is the opinion in the trade that the action of the authorities at Washington in again fixing the price of copper at 23.50 cents will give a stable market for the next four months.

PORCELAIN INSULATION.—Now that the government demand for standard porcelain for cantonment construction is past the peak, better deliveries on all porcelain goods are expected by the Chicago trade.

MOTORS.—The aeroplane and aeroplane parts factories which are being and have been established at various points in the Middle West have called for great quantities of standard electric motors. The business of these great new plants went in most cases to the firm which could deliver on demand. To meet the requirements for speed, motors were shipped from jobbing warehouses from coast to coast. The electrical goods, it is said, were always on hand when needed and did not delay the jobs.

BOSTON

Jobbers report a slight falling off in business, but this is looked upon as temporary. Government orders predominate, as usual in these days. The freight congestion on the railroads is a severe handicap to deliveries, both of raw materials and finished products. Heavy storms in the Middle West are indirectly affecting New England transportation facilities, and disadvantageously. Prices remain steady, an advance being looked for, however, in insulating tape in the near future. Lead-covered cable is quoted somewhat higher, owing to a recent advance of about 0.5 cent per pound in lead.

Mill and government collections remain in the gilt-edged class, but jobbers report little improvement in contractors' payments. In some cases central-station remittances are reported as slower than usual, but no fear appears to be abroad as to the fundamental soundness of such customers. The coal situation remains very serious.

The Narragansett Electric Lighting Company of Providence, R. I., expects to start service with a 45,000-kw. turbo-generator this week, materially relieving the power situation through the interconnected transmission lines. This company will shortly purchase \$25,000 more of electric motors and is optimistic as regards 1918 business.

MOTORS.—Stocks are improving in smaller sizes, but there is a decided shortage in units of more than 75-hp. rating. Government demands for large motors are unceasing. Prices remain firm, with no immediate prospect of a change, and deliveries show little improvement. Not infrequently motors are diverted to central-station customers en route from the factory to the stockroom.

METERS.—The low volume of house-building contracts has cut down the sale of meters to less than three-fourths of the normal rate. Factory stocks are accordingly improving against expected future demands. Prices steady.

TRANSFORMERS.—Deliveries of six to eight months are quoted on transformers of 100 kw. and more for industrial work, with about half this period on priority orders and on small units. Demand continues heavy with prices firm.

LAMPS.—The general supply situation improves. Curtailment of use to save fuel is now being felt in the trade, especially in sign lamps. Factories are seizing the opportunity to stock up on these small sizes. Glass shortage is upsetting some producers, and transportation delays, combined with breakages from rough handling, are rather burdensome. The labor supply has been studied effectively at the factories and the effect of the draft has been discounted. Pooling shipments in a single carload has not always worked well, in view of delays in transit. In one typical case a pooled shipment took five weeks as compared with five days' normal time between factory and distributor. Business holds good, despite the 10 per cent price advance of Jan. 1.

CONDUIT.—Jobbers' stocks are getting low and deliveries are getting poorer, owing to railroad embargoes. The mills are finding raw-material deliveries unsatisfactory. So far prices remain steady.

ASBESTOS INSULATION.—Deliveries are improving somewhat in ebony wood, and prices show little change. There is no local stock of plain asbestos wood reported by one large dealer.

FIBER CONDUIT.—Business continued brisk up to Jan. 1. Frozen ground accounts for a lull at present. A good deal of construction is expected this year in war-service plants.

ELECTRIC HEATERS.—Large sales are registered, one jobber's turnover running into thousands, with a demand great enough to warrant sending the purchasing agent to the factory.

ATLANTA

The general undertone of the electrical business, despite the many existing hindrances and elements of uncertainty, appears more confident, though there is no disposition to minimize the possible effects of further economic changes.

The intensely cold weather experienced in the Southeast lately, with storms in some sections, has interrupted business more or less generally, aggravating the already serious fuel and transportation problems, accentuating the difficulties in distribution and slowing up construction. While the fuel situation in the Southeast has shown a slight improvement this week, the necessity for further relief is still great, especially at industrial centers, where the fuel requirements are in excess of normal on account of the increase of government orders and shortage of rainfall.

The protracted drought is now being felt by hydroelectric companies, which experienced practically no difficulty from this source during December.

The consensus of opinion among the jobbers and manufacturers is that the volume of electrical business for 1918 will be even greater than that recorded in 1917. The optimistic feeling is engendered, no doubt, by the fact that a large amount of capital will be invested in shipbuilding at the Southeast coast cities, which will also require the expenditure of a big portion of the \$35,000,000 recommended by the Shipping Board to house workmen engaged at these points. Then, too, work is just being started on the Muscle Shoals nitrate plant. Information secured from reliable sources indicates that one of the government repair shops will be in Atlanta. It is expected that the general contract will be let this week calling for the expenditure of approximately \$1,750,000 covering this structure. Reports from Nashville, Tenn., state that the Du Pont Company, Wilmington, Del., contemplates the erection of a ninety-million-dollar plant on the Cumberland River, Tennessee, under government supervision.

FRICTION TAPE.—The demand is very heavy. Prices are up 40 per cent over January, 1917, this class of goods naturally following the price of cotton. Deliveries are reported as being good.

SOLDER.—This item closely follows the tendency of friction tape in demand, but prices have not advanced so

rapidly, being 20 per cent up over this period last year. Deliveries are good also.

LAMP GUARDS.—The recent advance in the price of lamps has stimulated this line, and a brisk trade is noted. Jobbers say that this activity is actuated by new year economies effected in lighting and lamp purchases by industrial plants. Deliveries are very good and prices firm.

PORCELAIN.—The call continues strong, and no price advance has been noted during the last thirty days. Jobbers report deliveries poor, running from four to six weeks.

WIRING DEVICES.—The class of goods used for inside purposes is in great demand and the volume of business is considerably above normal. Factory promises and shipments are fair, but deliveries have not been so good recently.

WIRE.—Prices have been weakening slightly during the past month on rubber-covered and weatherproof. Shipments are bad.

RECTIFIERS.—Considerable activity is noted in these for service with lighting and starting batteries, and an excellent business is being done. Up to a few weeks ago local stocks were in comparatively good shape, but transportation difficulties have affected these also and stocks are becoming depleted.

SEATTLE

Northwest jobbers, in Seattle particularly, report a noticeable increase in buying. January to date in sales to shipyards and industrial plants far outstrips the same month last year. This increase in sales is due to the number of shipyards and allied plants as compared with last year. It is believed the volume of sales to shipyards which now obtains will continue increasing throughout the present year. Jobbers generally are buying heavily since annual inventories were taken in an effort to fill stocks before drastic steps are taken by the government to eliminate manufacture and shipments of so-called non-essentials. Prices are standing still. Three-quarters-inch black conduit is exceptionally hard to get. There is a shortage of both large and small motors and a distinct shortage in lamps.

A perceptible impetus has been felt along building lines in both Seattle and Tacoma since the first of the year. This applies to residence building solely, to care for 20,000 shipyard employees whom the government intends placing in Puget Sound cities. It is announced that the government does not plan to erect dwellings to care for workers, but depends upon property owners to prove their civic and patriotic spirit by building on unimproved lots to care for the influx. The mobilization of skilled labor for war purposes is to receive its first test in Seattle. Electrical dealers, specifically, feel the effects of the residence building program under way. Sales of wiring materials, fixtures, lamps, bells, etc., are increasing daily. Jobbers are caring for the demand easily. The commercial boat and yacht builders and machinery houses are having a hard time meeting the extraordinary demand for craft, both for commercial purposes and pleasure. Electrical dealers are doing a neat business with these concerns.

The United States Shipping Board recently announced, in spite of reports to the contrary, that wooden shipbuilding plants in the Seattle district will continue to receive government contracts to their full capacity as long as prices and deliveries are satisfactory. Additional contracts for Puget Sound yards are now being arranged.

For the first time in two weeks normal train service over all transcontinental lines has been resumed. Although freight shipments from Eastern points were delayed, jobbers were not seriously inconvenienced and the shipbuilding program was not halted noticeably. Deliveries long past due are coming through slowly. Advantages predicted when the government took over the railroads, such as the intra-terminal shipping maximum loading of cars, have not yet materialized. Much of the freight congestion at Northwest lumber mills, however, has been relieved.

On flood lamps an increasing demand is noted from several sources, particularly shipyards and government cantonments. Stocks seem ample. Sales, however, are expected to decrease with the coming of spring. There has been no

noticeable change in prices for months. Farm lighting outfits continue moving well, although a large volume of sales were made prior to the holidays. The campaigns conducted in the fall and early winter are declared very successful, especially among farmers in eastern Washington.

Switchboard instruments and switches of all kinds are moving very satisfactorily. Stocks are in fair condition and prices remain steady. Telegraph and telephone apparatus is moving very slowly. A majority of the sales are for repairs and maintenance. The recent storms and the subsequent damage to lines in the upper Sound country resulted in a slight increase in the buying of wire, insulators and pole-line materials. The volume of sales is very small. Electric glassware fixtures and the like are moving faster. There are ample stocks and even prices. Some jobbers are ordering for spring deliveries. Sales are expected to exceed by far last year's record on account of the anticipated increase in residence building. Flashlamps and flashers are moving fairly well. There had been a heavy movement, but sales are now smaller. A shortage of this merchandise is at hand and deliveries are very slow. Jobbers are ordering heavily. No increase in prices is noted.

Credit managers, as a whole, report that collections during 1916 were considerably better than in 1917. This applies to all months excepting December last, and to all credits with the exception of the government. However, government collections are improving steadily, owing, it is said, to more expeditious and efficient handling of supplies. Government purchases for the navy, from which Seattle jobbers derive a large business, are not paid for until ten days after the merchandise is inspected and approved. Heretofore in many instances goods were not inspected for months after delivery on account of the enormous volume. This necessarily made collections slow. Very few new credits of any size were placed since the first of the year. Credit managers say, however, that there is no occasion for pessimism and that undoubtedly 1917's record for business will be equaled if not exceeded this year. December's collections were easy and highly satisfactory.

SAN FRANCISCO

Beginning immediately after the holidays, building activity in San Francisco increased remarkably. During the months of November and December there had been very much less than the usual construction, particularly in apartments, hotels and office buildings, but in the first twelve days of January the city building department reported having passed upon a greater amount of work than the total for the months of November and December. Many of the new structures are machine shops, garages and warehouses, with a few loft buildings. The inquiries now regularly being made at the building inspector's office indicate that activity in this line will probably continue for some time.

The petroleum industry constitutes an important feature of California trade and construction activity just now. From the oil districts in the vicinity of Coalinga and Taft, and, in fact, wherever oil fields are tapped by the long-delivery pipe lines, the demand for electrical equipment has been steady and very heavy. Producers' committees have been successful in securing special priority orders on motors and other equipment for oil-field use. Transportation has been receiving careful attention, and especial effort is being made to increase warehouse and terminal storage space. In response to the Railroad Director's appeal for freight clearance, a committee was last week formed in San Francisco which released 200 freight cars for service within forty-eight hours.

At a hearing before the Railroad Commission this week, at which the advantages of interconnection of transmission lines were discussed, complaint was made that power companies are getting into bad shape financially because of increasing costs and unchanging rates. The construction of hydroelectric development is held up on this account, and a power shortage is predicted as a result, because industrial demands in the bay region are rapidly increasing and even the present sources of supply are barely sufficient. Moreover, the California rainfall this winter has thus far been the least recorded in sixty-nine years and water power next season will be affected accordingly.

Current Prices of Electrical Supplies

New York and Chicago Quotations

THE prices quoted are those prevailing in standard packages or specified lots on apparatus and appliances in Eastern and Middle West markets at the beginning of business on Monday of this week. They are in all cases the net prices or prices subject to discounts from standard lists of contractors, central stations, dealers and others engaged in the resale of such goods.

Prices in Southern and other nearby markets will rule about the same as those in the Middle West, although slight modifications to cover increased freight and local demands should be expected. In the Far West and on the Pacific Coast the prevailing prices are naturally higher, covering as they must

increased freight and the necessity of larger stocks with increased interest and warehouse charges on account of the distances from sources of supply, infrequent turnover of stock and uncertainty as to delivery of goods in transit. Moreover, the Far West presents a wide variation in demand due to a small population spread over a wide area in agricultural and mining communities, as contrasted with the denser population of the East and Middle West, their nearness to the source of supply, the more frequent turnover in stocks and the constant demands which arise in industrial centers. Price variations may be due to difference in grade of products of different manufacturers, to local conditions, or to both.

NEW APPARATUS & APPLIANCES

A Record of Latest Developments and Improvements in Manufacturers' Products Used in the Electrical Field

Vertical Rotative Dry-Vacuum Pump

Attention is called to the fact that the vertical type of dry-vacuum pump manufactured by the Wheeler Condenser & Engineering Company of Carteret, N. J., is in demand by ship and stationary plant builders who are anxious to save as much space as possible and who at the same time have their eyes open to economy. Where much condensing is to be done and where high vacuum is to be maintained it is generally best to install separate condensate and air pumps. Thus a motor or turbine-driven centrifugal hot-well pump can easily take care of the condensate while this Wheeler dry-vacuum air pump withdraws the air.

The inlet valves of this vacuum pump are of the semi-rotative type, which are so manipulated by the valve gear as to draw air from the condenser during its full stroke. Clearance difficulties are eliminated in this design of valve gear by providing ports which register with an equalizing passage. The discharge valves are of the poppet type and are easily accessible. In fact, all parts are easily accessible, a point that is of great value in high-vacuum pumping machinery. Valve arrangement is such as to insure perfect drainage at all times.

The makers point out that a motor-driven dry-vacuum pump has numerous other advantages over direct steam drive, among which are ease of installation, less attention required, no steam pipe radiation losses, and improvement of plant load factor.

Skip Hoists

Automatically operated skip hoists for the speedy and efficient handling of coal, ashes and similar materials in gas plants, central stations, mining plants, factories, etc., have been developed by the Otis Elevator Company of New York City. These skip hoists may be divided into two classes according to whether the bucket for carrying the load travels vertically or on an incline. Both vertical and incline hoists may be equipped with a single hoisting bucket, which may or may not require a counterweight, or with two hoisting buckets running on separate tracks, the one acting as the counterweight for the other. For the duties generally found in handling coal, ashes, etc., in manufacturing plants and central stations standard elevator hoisting machines are used. These can be installed either overhead or at ground level, adjacent to the hoistway. The usual machine consists of a single or double drum, a

worm-gear reduction, an electrically released, spring-applied shoe brake and a motor, all of these parts being mounted on a heavy cast-iron base plate to preserve alignment.

The control system generally furnished is entirely automatic. The operation is by means of three push-buttons marked "up," "down" and "stop." When the bucket has received its load the attendant presses the "up" button, which causes the machine to start, and from this point the operation is entirely automatic. The machine accelerates to full speed, the bucket rises to the upper

DETAILS OF AUTOMATICALLY OPERATED
SKIP HOIST

level, and at the proper point the machine slows down and the bucket travels into the dumping position, where on single skips it stops and automatically remains for a predetermined interval which is sufficient to allow the material to be entirely discharged from the bucket. The machine then automatically starts in the "down" direction and continues in operation until the bucket reaches the lower level and automatically stops in the loading position. A pressure of the "stop" button at any time during the travel of the bucket will cause the machine to come to rest.

In the case of a double skip hoist, when the ascending bucket reaches the dumping position the machine remains stationary until it is again started by the operator at the loading point, the operator having in the meantime attended to the loading of the other bucket.

The bucket usually furnished for vertical skip hoists, either of the single or double skip type, is made of heavy steel plates reinforced with structural shapes and provided with two cams symmetrically placed on each side of the bucket. These cams are made of channels or angles properly shaped and riveted to the bucket. The bucket is supported in a steel frame or sling by means of two trunnions and is held in an upright position and guided during its travel by means of two steel brackets bearing against angle-iron guides.

Renewable Fuse

The Chicago Fuse Manufacturing Company of Chicago is marketing the fuse it has purchased from the Multi Refillable Fuse Company under the trade name of "Union." The present form of the fuse is the result of extensive experiments and improvements. The tubing used is the best-quality horn fiber of extra thickness. The ferrules and caps are of brass and designed to withstand the heavy strains incident to a fuse without powder filler. The method of attaching the cap allows an exceptionally heavy pressure to be brought to bear upon the contact with the end of the renewable element, thus reducing the heat developed to a minimum and guarding against accidental loosening of caps through rough usage.

Car-Loading Machine

The Link-Belt Company of Nicetown, Philadelphia, Pa., has recently put on the market a low-priced machine for loading all kinds of material into box cars. The machine is shown in the accompanying illustration and is called the Link-Belt BX loader. It is a portable machine, driven by motor or gas

MOTOR-OPERATED LOADING MACHINE

engine, and handles the material delivered to it through the steel hopper on a flat belt. On a recent test it loaded eighty box cars in six days with but two men. Its capacity is 80 tons to 100 tons per hour.

Toggle Snap Switch

Harvey Hubbell, Inc., of Bridgeport, Conn., has brought out a toggle surface switch which differs from the ordinary snap surface switch in that manipulation is by the throw of a lever or toggle, instead of by the turning of a key or button. Throwing the lever

SWITCH IS SELF-INDICATING.

up makes the circuit; throwing it down breaks the circuit. The advantages claimed for the toggle movement in a surface switch are, first, that it permits making the switch more attractive and stronger than the ordinary switch; second, manipulation is much more convenient by means of the lever than by the turning of a key; third, the switch is self-indicating, the position of the lever showing at a glance whether the current is "on" or "off" without any marker or dial. This switch conforms with the National Electrical Code standard requirements.

Plug Receptacle

The Gordon Electrical & Manufacturing Company, 430 South Green Street, Chicago, recently placed upon the market its No. 1708 Edison screw-plug flush receptacle. All plugs are made of solid brass in accordance with the requirements of the Underwriters' Laboratories, Inc., which has thoroughly approved the receptacle. The product is a slight departure from the ordinary receptacle in that the terminals and contact pieces together with brass-plated brackets at each end are used.

Automatic Controller or Rotary Switch

The accompanying illustration shows an automatic controller constructed by the Reynolds Electric Company of Chicago and New York for a fire-alarm siren made by the Federal Sign System (Electric) of Chicago. By an ingenious arrangement of contacts the sounds from the siren are graduated in

FOR A FIRE-ALARM SIREN.

tones ranging from low to shrill, and by means of suitable gearing the blowing, after continuing for a period of two minutes, is automatically cut off. To start the controller the mere pressing of a push-button switch suffices.

This closes the circuit and starts the motor driving the controller, another switch on the controller opening the motor circuit after two minutes' operation, thus making practically an automatic device.

The motor is directly geared to the controller to insure a positive drive. The fingers are reinforced at the contact end and are of the "quick-break" type, and a holder provides for 1-in. (2.54-cm.) take-up in case of wear. The contacts are removable and adjustable.

Similar controllers are now being furnished by the Reynolds Electric Company to the city of Chicago for flashing "stop" signals, gate lights and ringing gongs when a drawbridge is open and the gates are down, giving a positive alarm both by light and sound.

Externally Operated Switches

The Trumbull Electric Manufacturing Company of Plainville, Conn., has developed several externally operated switches, one of which is shown herewith. In the fusible-top type the cover

FUSIBLE-BOTTOM TYPE OF SWITCH

prevents the switch from being connected until the box is closed, and in the fusible-bottom type the catch at the side prevents the switch from being connected until the box is closed. It is pointed out that the box cannot be opened when the switch is in contact and that it can be locked and sealed when the switch is in open position. The switches are of the quick-break type.

Motor-Generator Sets

Unit-type motor-generator sets for battery-charging and signal work are being made by the Electric Specialty Company of Stamford, Conn. These motor-generator sets are for charging storage batteries, operating electromagnets, bells or any form of signals. They are constructed to operate on 110 volts or 220 volts direct or alternating current. The smallest size delivers 20 watts and is intended for use only where a very small amount of power is required. Other types are suitable for charging one 6-volt battery at 8 amp. and 12-amp. respectively. The largest size, rated at 300 watts, will charge five 6-volt batteries at 10 amp. charge, tapering down to 8 amp. One type of

set is furnished with oil-wick bearings and the other with oil-ring bearings. Motor-generators of more than 100 watts capacity only are regularly furnished with rheostats.

Light for Shaving

An electric light attachment to be used with a safety razor has recently been developed and is shown herewith. The outfit is complete with razor, trench mirror, strop handle and extra blades. The "Shavelight" attachment can also be used to advantage with a pencil or a fountain pen. The battery is of standard size and said to last for more than 100 shaves. The whole outfit is contained in a handsome khaki case. The Shavelight Corporation of 30 Church Street, New York City, is the manufacturer.

Pulley-Driven Propeller Fans

Pulley-driven propeller fans are one of the latest additions to the ventilating-fan equipment of the Batterman Truitt Company of Chicago. These fans are equipped with split-hub-type pulleys, the pulley being overhung on the fan shaft. This construction, it is pointed out, allows the removal or replacing of the belt at will and without necessitating the loosening of bearings and dismantling the fan frame. These fans are of two-bearing-type construction, having one bearing on each side of the fan wheel. These bearings are mounted in a retaining housing and are rigidly set in this housing with adjustable set-screws, thus allowing for their removal for inspection purposes. The bearings are of the split-bearing, ring-oiling, ball and socket type. These fans are made in diameters from 18 in. to 60 in. (45.7 cm. to 152.4 cm.).

Double-Outlet Current Tap

Harvey Hubbell, Inc., of Bridgeport, Conn., is supplementing its standard-single-outlet current tap with a new one providing two plug outlets in addition to the lamp outlet. This tap is to be known as No. 6553. This de-

TWO PLUG OUTLETS PROVIDED IN ADDITION TO LAMP OUTLET.

vice is constructed throughout of porcelain and is fitted with a shade-holder groove and slots so designed as to accommodate any one of this company's different styles of interchangeable plug caps.

Trade Notes

RATHBONE, SARD & COMPANY of Chicago are establishing wholesale offices and warehouses to handle their business in the Pacific Northwest.

THE WESTERN SERVICE COMPANY, Spencer, Iowa, has been organized for the purpose of engaging in civil and electrical engineering and power-plant efficiency practice.

THE PITTSBURGH ELECTRICAL SPECIALTIES COMPANY has moved from Pittsburgh to New York City, with offices at 336-338 Broadway. The factory is at 41 Greenwich Street.

GEORGE A. SCHNEIDER will succeed J. W. Tabb as manager of the Western Electric Company's branch at Buffalo, N. Y. George Seiss has been made assistant manager of the Cleveland office.

R. H. BALFOUR, sales manager of the Eugene F. Phillips Electrical Works, Ltd., Montreal, Canada, has been elected a director of the company. The capital of the company has been increased to \$4,000,000.

F. V. GENTT, manager of the Louisville (Ky.) branch of the General Electric Company, has gone to Cincinnati, Ohio, where he will have charge of the central station and electric railway sections of the company.

J. C. MANCHESTER is now district sales manager for the Economy Fuse & Manufacturing Company, San Francisco. Mr. Manchester was formerly connected with the Interstate Electric Novelty Company in that city.

THE ESTERLINE COMPANY of Indianapolis, Ind., announces the appointment of J. S. Pandiani, Via Mario Pagano, 27, Milan, Italy, as trade representative for that country. Mr. Pandiani was until recently manager of the meter and supply department of the Italian Westinghouse Company and will in the future give his attention to the sale of Esterline instruments and permanent magnets throughout Italy.

MCDONNELL & COMPANY of San Francisco, Cal., are distributing a circular dealing with the Poulsen Wireless Corporation. The patent originally introduced in this country from Denmark has been amplified by L. F. Fuller. The system has been adopted by the United States government at Cavite, Philippine Islands, for a plant nearing completion. The French government has closed a contract with the corporation for what is described as the most powerful wireless installation in the world.

THE GUARANTY TRUST COMPANY of New York City has compiled a complete list of holidays of all nations in a booklet of 145 pages. The reader may determine in a moment whether any day of the year is a holiday anywhere in the world; or, if the question is approached from the opposite side, what days in the year are celebrated as holidays by any particular country. It is designed for the use of manufacturers, jobbers, etc., doing an international business. Its compilation was made necessary by the new position of world leadership taken by American business men. A knowledge of what days are closed to business in any given country is highly important in carrying on international trade.

THE PHILADELPHIA STORAGE BATTERY COMPANY of Philadelphia has secured the services of G. L. Barrett as manager of the Southwestern division, and he will be found at 2605 Locust Street, in the Coliseum Building, St. Louis. Mr. Barrett was formerly president and general manager of the Willard Storage Battery Company of Texas, and has been in Texas for two and a half years handling the Southwestern distribution of the Willard storage batteries. Previous to that he was connected with the Willard company at Indianapolis and Cleveland, working in the starting, lighting and vehicle field. For six years previous to this he was in the automobile business in Minneapolis, Minn., in both gas and electric lines.

FORD, BACON & DAVIS announce the formation of the Ford, Bacon & Davis Corporation, organized for the purpose of conducting a general contracting business, with particular reference to industrial, public utility and power plants, steam and street railroads, docks, steamship and railway terminal facilities, subways, tunnels, hydroelectric and irrigation projects. In effect this means the continuance in corporate form of construction work which heretofore has been handled by the firm direct. The corporation's headquarters are at 115 Broadway, New York, with offices at New Orleans and San Francisco. The facilities from the firm of Ford, Bacon & Davis, now

in its twenty-fourth year, which continues as heretofore, are available to the new corporation.

THE DRIVER-HARRIS COMPANY of Harrison, N. J., has announced an additional benefit according to its employees in the nature of paid-up life insurance. On Jan. 1 there was distributed to all employees who had been with the company at least six months on that date a life insurance policy for \$500. It is the intention of the company to make a further distribution of these policies as other employees reach the six months' service period. The extra wage distribution this year was increased by 1 per cent over what has been paid heretofore. This distribution is based on salaries earned and terms of service and is distributed twice yearly. The percentage is graduated, beginning at 6 per cent to employees who have been with the company six months and increasing one-half of 1 per cent for each succeeding year of continuous service. The Jan. 1 distribution amounted to about \$15,000. The fourth annual dinner of the company was held at the Downtown Club, Newark, N. J., Dec. 28, and was a very enjoyable affair.

THE NATIONAL BANK OF COMMERCE of New York City has compiled interesting statistics and information on the trade between the United States and New Zealand. The changes in trade routes occasioned by the war have greatly favored the export business of the United States. The bank has issued this statement which discusses the development of trade from the beginning of 1915 until the present: "In the field of electrical machinery the United States is gaining. In 1915 it supplied approximately one-fifth of all the electrical machinery which was imported into New Zealand, and in 1916 supplied one-fourth. It has met the Japanese as competitors in electrical supplies, but Japanese articles have apparently been found unsatisfactory. There is a great trade in New Zealand in electric torches and batteries. Americans lead the market, and for similar articles the American product is much cheaper. American batteries are also accompanied by a guarantee of service. Japan has delivered a great number of torches and batteries, but they are not satisfactory."

Trade Publications

PLIERS.—"Rimco" rubber-insulated pliers are illustrated and described in a leaflet prepared by the Rubber Insulated Metals Corporation of Plainfield, N. J.

LAMPS.—The Westinghouse Lamp Company of New York City has prepared a folder showing the growth of its plants caused by the increase in demand for its lamps.

SWITCHES AND PANELBOARDS.—The Leonard-Bundy Electric Company of Cleveland, Ohio, is distributing its bulletin E, descriptive of safety-type knife switches and panelboards.

FANS.—The Baiterman Trullitt Company of Chicago has prepared bulletin No. 43, descriptive of its pulley-driven propeller fans. This company has also issued its bulletin No. 44, giving information on its "Autovent" louvers.

REAMERS.—The Taft Pierce Manufacturing Company of Woonsocket, R. I., is distributing its bulletin No. 101, descriptive of the Martell system of line reaming bearings. Special applications of the Martell reamer are outlined.

FUSES.—The Trico Fuse & Manufacturing Company of Milwaukee, Wis., has prepared a leaflet descriptive of its renewable cartridge fuses. Seventeen features of these fuses are pointed out in this leaflet. This company has also printed a leaflet giving list prices of the fuses.

CHAIN DRIVES.—"The Ideal Drive for Rubber Mill Machinery" is the title of book No. 299, which has been prepared by the Link-Belt Company of Chicago, Ill. Illustrations and reasons why the Link-Belt drive is the ideal drive for rubber mill machinery are given. The bushed joint of the Link-Belt silent chain is described, as are casings for silent chain drives.

LIGHTING AND POWER PLANTS.—The Main Electric Manufacturing Company of Pittsburgh, Pa., has issued its catalog No. 100, in which are described the Main electric lighting and power plants. Valuable technical data, the amount of energy used by various appliances and wiring information are included. This is a well prepared and illustrated catalog and should be in the hands of all interested in this subject.

ROOF CONSTRUCTION.—The Asbestos Protected Metal Company of Pittsburgh, Pa., has prepared its bulletin No. 59 on the subject of "Roof Construction for Factory Buildings." In this bulletin it is brought out that the gypsum roof made by this company not only meets all of the exacting requirements of an ideal roof construction, in a way that entirely overcomes practical and economic objections, but offers several distinctive advantages that cannot be obtained with any other type of roof. Illustrations of representative installations are given.

GAS METERS.—The Backarach Industrial Instrument Company of Pittsburgh, Pa., is distributing its catalog E, descriptive of its "Hydro" gas meters. A review of the various methods employed for measuring gases, such as impact and Pitot tubes, orifices, nozzles, Venturi tubes, etc., is given. It is pointed out that in each of these devices the differential pressure is the quantity to be measured, and then follows a description of the "Hydro" instrument which measures and records this differential pressure accurately. Applications of the Hydro volume meter to blast furnaces, by-product coke ovens, gas works, producer plants, etc., are given, as well as for measuring air for mine and building ventilation.

New Incorporations

THE MENAHEG (MINN.) ELECTRIC COMPANY has been incorporated with a capital stock of \$10,000 by S. J. Zeeman and others.

THE ELECTRIC SERVICE COMPANY of Cedar Rapids, Iowa, has been chartered with a capital stock of \$20,000 by C. E. Rowe and others.

THE ELECTRIC MANUFACTURING COMPANY of Cairo, Ill., has been incorporated with a capital stock of \$550,000 by Henry Tideman, Charles M. Roos and James H. Galligan.

THE HOLLY (S. C.) HILL ELECTRIC SERVICE COMPANY has been incorporated by S. P. Wells, B. R. Bennett and R. G. Carson of Holly Hill. The company is capitalized at \$10,000.

THE CENTURY TELEPHONE CONSTRUCTION COMPANY of Buffalo, N. Y., has been incorporated with a capital stock of \$10,000 by E. H. Letchworth, W. M. Wilkins and C. M. Baldy of Buffalo, N. Y.

THE STORAGE BATTERY REBUILDING COMPANY of Cleveland, Ohio, has been incorporated by Henry L. Beggs, Samuel L. Bowls, Lawrence C. Meyer, Arthur W. Longbarger and Gilbert J. Spencer. The company is capitalized at \$15,000.

THE HYDRAULIC ELECTRIC COMPANY has filed articles of incorporation under the laws of the State of Delaware with a capital stock of \$50,000. The incorporators are: J. J. Hobbs, Randolph C. Shaw and A. W. Britton, all of New York, N. Y.

THE MONARCH STORAGE BATTERY COMPANY of Grand Rapids, Mich., has been incorporated by T. H. Lavier, H. B. Knowlson, H. G. Dykhouse and others. The company is capitalized at \$20,000 and proposes to manufacture and deal in storage batteries.

THE WAYLAND (MICH.) ELECTRIC LIGHT & POWER COMPANY has been incorporated with a capital stock of \$5,000 to furnish electricity for lamps, heaters and motors in Wayland. The incorporators are: L. B. Mason, E. O. Hanlon, A. E. Weaver and others.

THE RICHARDSON AUTO ELECTRIC CORPORATION, Charles Street and Lafayette Avenue, Baltimore, Md., has been incorporated by Donald R. Richardson, Frank Laurence Pollard and Carl C. Schmidt. The company is capitalized at \$50,000 and proposes to manufacture and repair batteries.

THE BLESSING MANUFACTURING COMPANY of San Francisco, Cal., has been chartered with a capital stock of \$20,000 by H. H. Traub, J. W. Lederman, E. D. Lederman, L. Van Orden and T. E. Pawlicki, all of San Francisco, Cal. The company proposes to manufacture tools and machinery for the development of power by gas, steam, electricity, etc.

THE I. H. SIMPSON HARDWARE COMPANY of New York County, N. Y., has been incorporated by I. H. Simpson, 410 West End Avenue; C. W. Simpson, 356 Fourth Avenue, New York City; L. Genn, 42 Montrose Avenue, Brooklyn. The company is capitalized at \$50,000 and proposes to do a general contracting and electrical business and deal in plumbers' supplies.

New England States

RANGELEY, MAINE.—The electric plant of the Quossoc Light & Power Company is nearly completed, and is expected to be ready to put in operation about Feb. 1. F. B. Colby is president and manager.

CAMBRIDGE, MASS.—Extensive improvements are contemplated by the Cambridge Electric Light Company, including the installation of a 12,500-kw. turbine, two 600-hp. boilers, ash-handling system and extension of switchboard. Welles E. Holmes is general manager.

GARDNER, MASS.—The Gardner Electric Light Company contemplates the installation of an additional 1500-kva. bank of transformers this spring. C. A. Ware is manager.

MANSFIELD, MASS.—Two 250-kva. Westinghouse transformers will soon be installed in the municipal electric-light plant to replace two 125-kw. transformers now in use. George W. Wood is manager.

NORTH ATTLEBORO, MASS.—The extension of the commercial lighting lines of the municipal electric-light plant into Adamsdale is under consideration; also the purchase of electricity from the Attleboro Steam & Electric Company. William Plattner is manager.

PITTSFIELD, MASS.—The Pittsfield Electric Company is planning to install a 2500-kw. General Electric turbo-generator and two 520-hp. Babcock & Wilcox boilers. W. A. Whittlesey is superintendent.

READING, MASS.—Extensions and improvements are being made to the municipal electric-light plant, including an addition to boiler room, a new 600-kw. General Electric turbine, Wheeler condenser, an additional boiler, new switchboard, and changing the plant from two to three phase system. Arthur G. Sias is manager.

WEST SPRINGFIELD, MASS.—The Gilbert & Barker Company, Church Street, has awarded a contract for construction of an addition to its power plant, 55 ft. x 95 ft., one story, to the H. Wales Lines Company, 134 State Street, Meriden, Conn.

HARTFORD, CONN.—Contract has been awarded to J. H. Crozier, 721 Main Street, Hartford, and plans filed by the Southern New England Telephone Company, 185 Pearl Street, for additions and alterations in its exchange building, to cost about \$10,000.

Middle Atlantic States

BROOKLYN, N. Y.—The Transit Development Company, a subsidiary of the Brooklyn Rapid Transit Company, has awarded a contract to the Structural Concrete Company for the construction of an addition to its electric generating plant at Kent and Division Avenues, to cost approximately \$500,000. The building will be 211 x 257 ft., six stories high.

FREDONIA, N. Y.—The city of Fredonia has entered into a contract with the Niagara & Erie Power Company of Buffalo for furnishing electricity for lighting the streets, parks and public buildings in Fredonia for a period of five years. The municipal electric light plant will be closed down.

GOWANDA, N. Y.—The construction of a new electric power plant is reported to be under consideration by the Gowanda Light & Power Company.

LONG ISLAND CITY, N. Y.—The power plant of the New York & Queens Electric Light & Power Company on Mills Street was recently damaged by fire, causing a damage of about \$15,000.

NEW YORK, N. Y.—Bids will be received by the State Hospital Commission Capitol, Albany, N. Y., until Jan. 29, for installation of an electric-lighting system consisting of underground feeder, poles, etc., for incandescent lamps, at the Manhattan State Hospital, Ward's Island. T. F. Pilcher is State architect.

ANDOVER, N. J.—Due to the scarcity of both coal and water, the Andover Electric Company, which has had dual power, has issued notification that it has been compelled to suspend operations temporarily.

EAST ORANGE, N. J.—The City Council in its annual budget for 1918, has provided for an appropriation of \$52,500 for street-lighting purposes. The requisition has been approved.

EDGEWATER, N. J.—Plans have been filed by Spencer Kellogg & Sons for the construction of an addition to its power house, about 50 ft. by 50 ft., one story, at its plant. Contract has been awarded to the John W. Ferguson Company, 152 Market Street, Paterson.

JERSEY CITY, N. J.—Contract has been

Construction

News of Projects, Plans, Bids and Contracts. Notes on Work Under Way

awarded by the Erie Railroad Company to F. A. Knapp, Jersey City, for the construction of a galvanized iron boiler house at its yards at the foot of Pavonia Avenue.

KEARNEY, N. J.—Plans have been filed by the Federal Shipbuilding Company for the erection of a large power house and boiler shop at its works, to cost \$60,000 and \$170,000, respectively.

MATAWAN, N. J.—The installation of electrically operated pumping machinery in the municipal water-works system is under consideration by the Borough Council.

NEWARK, N. J.—The lowest bid submitted to the Board of Freeholders for the installation of electric-lighting and power wiring in the laundry building at the County Hospital at Overbrook, was submitted by the Beyer Engineering Company of Newark, at \$14,174.

TOMS RIVER, N. J.—The Board of Public Utility Commissioners has granted the Toms River Electric Company permission to issue \$15,000 in capital stock, the proceeds to be used for extensions, improvements, etc.

TRENTON, N. J.—Work has begun on placing of foundations for the new 2000-hp. engine and generator to be installed in the plant of the Trenton & Mercer County Traction Corporation, for which orders have already been placed. The company is making extensive improvements throughout its entire plant and has also commenced the reconstruction of the portion of its car barns recently destroyed by fire.

BRIDGEPORT, PA.—Plans have been filed by the Philadelphia & Reading Railway Company, Reading Terminal, Philadelphia, for the erection of an addition to its local power house, about 95 ft. x 100 ft. Contract for the building has been awarded.

CLIFTON HEIGHTS, PA.—Plans are being prepared for interior alterations to the local electric plant to provide for the installation of power equipment. Frank E. Hahn is architect.

COATESVILLE, PA.—The Chester Valley Electric Company is erecting a new electric transmission line from its station at Phoenixville into Coatesville, a distance of about 18 miles, to supply electricity to the plants of the Midvale and Lukens Steel companies in Coatesville.

HARRISBURG, PA.—Extensive improvements are contemplated by the Harrisburg Light & Power Company in its steam heating plant. C. M. Kaltwasser is manager.

NEW BOSTON, PA.—Plans are being considered by the New Boston Coal Land Company for equipping its Morea mine for electrical operation throughout.

NORRISTOWN, PA.—The Counties Gas & Electric Company has filed notice with the Public Service Commission of an issue of bonds to the amount of \$300,000 for extensions, improvements, etc., to its system.

PITTSBURGH, PA.—A permit has been granted to the National Biscuit Company for the erection of bakery, power plant, garage and stables at Penn Avenue and Lambert Street. The total cost is estimated at \$550,000.

PITTSBURGH, PA.—Application has been made by the Allegheny County Steam Heating Company of Pittsburgh for permission to lease a portion of the Allegheny County Prison, which will be utilized as an auxiliary to its present plant.

WILLIAMSPORT, PA.—Extensive improvements are contemplated by the Lycoming Edison Company to its plant and system during 1918. Arrangements are now being made for an appropriation of about \$250,000 for the proposed work.

BALTIMORE, MD.—Plans have been filed by the Bartlett Hayward Company, Scott and McHenry Streets, for the erection of a new transformer station at Hamburg and Gunpowder Streets. Contract for building has been awarded to Morrow Brothers, Fidelity Building, Baltimore.

CUMBERLAND, MD.—The Cumberland Electric Railway Company is planning to construct an extension to the plant of the Kelly-Springfield Tire Company and to the new Ridgedale addition and also double-tracking on Green and Water Streets.

PRINCESS ANNE, MD.—E. C. Cannon, owner of the local electric-light plant, ex-

pects to establish a 24-hour service April 1, unless prevented by war conditions.

CHARLESTON, W. VA.—The Charleston-Dunbar Traction Company expects to place in service 9 miles of track between Dunbar and Poca during 1918.

DUNGANNON, VA.—Plans are being considered by Charles F. Hagan, trustee of Patrick Hagan Estate, Bristol, Va., for the construction of a hydroelectric power plant on Clinch River, near Dunganon.

GLEN LYN, VA.—Plans have been completed by the Appalachian Power Company of Bluefield for the construction of a steam-driven electric generating plant on New River providing for an ultimate development of 75,000 kw. The power house and equipment will cost about \$2,000,000. The initial installation will have a generating capacity of 16,750 kw. The water intake, etc., will provide for ultimate capacity. Contracts for equipment, including turbine, boilers, transformers, condensers, pumps, automatic stokers, switchboard, coal-handling machinery, etc., have been awarded. Viele, Blackwell & Buck, 49 Wall Street, New York, N. Y., are designing and constructing engineers.

RICHMOND, VA.—Plans have been prepared and application filed for permit by the Virginia Railway & Power Company for an addition to its power plant at the foot of Twelfth Street, to cost about \$6,000.

SUFFOLK, VA.—The Virginia Railway & Power Company, it is reported, will erect an electric transmission line from Petersburg to Suffolk.

THE PLAINS, VA.—The Plains Electric Light Company, it is reported, is planning to rebuild its electric-light and power plant, recently destroyed by fire.

WYTHEVILLE, VA.—R. P. Johnson, First National Bank Building, Wytheville, it is reported, would like to receive prices on a 200-kw. (Westinghouse preferred) direct-current, 250-volt, 800 amp., 200 r.p.m. generator, second hand, in good condition.

WASHINGTON, D. C.—Bids will be received at the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., for furnishing at the various navy yards and naval stations supplies as follows: Various, Schedule 1653—30 motor-generator sets, Philadelphia, Pa., Schedule 1652—one mill type tractor. Application for proposal blanks should designate the schedule desired by number.

WASHINGTON, D. C.—Bids will be received at the office of the supervising architect, Treasury Department, Washington, D. C., until Feb. 1 for the installation, complete, of an elevator in the United States post office and court house extension at Oklahoma City, Okla., and in the United States court house, etc. (remodeling), at Austin, Tex. Drawings and specifications may be obtained at the above office.

WASHINGTON, D. C.—Bids will be received at the general engineer depot, 1438 U Street Northwest, Washington, D. C., until Jan. 21, for furnishing (under circular 513) the following supplies: 1600 lightning arresters, 1600 extra gaskets, 1600 lightning arresters, 8000 guy anchors, 160,000 cross-arm braces, 480,000 short malleable brackets, 160,000 oak brackets, 1600 tool belts, 3,200,000 porcelain cleats, 80,000 cut-outs, 80,000 cutouts, 16,000 guy clamps, 1600 splicing clamps, 160,000 cable connectors, 160,000 cable connectors, 648,000 plug type fuses, 156,000 inclosed fuses, 72,000 inclosed fuses, 3200 lb. fuse wire, 1600 fuse boxes, 4000 link fuses, 8000 link fuses, 4000 wire grips, 400 lineman's slack tackle, 3200 enameled hoods, 1600 hatchets, 2200 handles, 800,000 brass insulators, 32,000 porcelain insulators, 24,000 porcelain knobs, 480,000 insulator pins, 555 kerosene fire pots, 555 melting pots, 80,000 connecting plugs, 480,000 pendant cap rosettes, 480,000 reflectors, 800 wire reels, 1600 reducers, 1600 reducers, 240,000 brass sockets, 200,000 brass sockets, 40,000 cleat base sockets, 160,000 rotary switches, 24,000 knife switches, 12,000 knife switches, 1600 safety straps, 769,600 porcelain tubes, 400,000 lb. black friction tape, 9600 copper terminals, 4800 cable taps, 32,000 cable taps and 400 tube cutters. For further information address the above office.

North Central States

BELLAIRE, MICH.—The city of Charlevoix has entered into a 10-year lease with the Hydraulic Power & Light Company for all power generated by the company, with an option to buy the plant, which will be submitted to the voters in the spring. The installation of a 350-hp. vertical hydroelectric generating unit this spring is under consideration by the city of Charlevoix. Henry Richardi is president and treasurer.

BENTON HARBOR, MICH.—The Benton Harbor St. Joe Railway & Light Company is changing its system from 2300-volt delta to 4000 volt Y. John A. Cavanaugh is superintendent.

ROYNE CITY, MICH.—The Roynce City Electric Company will add 10 incandescent street lamps as soon as the weather will permit. Extensions and additions to the domestic service will require rearrangement and addition to transformer outfit in the spring. Charles T. McCutcheon is superintendent.

CHARLEVOIX, MICH.—The city of Charlevoix has entered into a contract with the Hydraulic Power & Light Company for a lease of all power generated by the company for a period of ten years, with an option to buy. The proposal will be submitted to the voters in the spring.

COLDWATER, MICH.—The Board of Public Works is contemplating the installation of a 750-kw. turbo-generator set, barometric condenser, centrifugal circulating pump, flywheel air pump, feed water heater, etc., in the municipal electric-light and water works plant. L. E. McQueen is superintendent.

HOWELL, MICH.—The Board of Public Works contemplates improvements to the electric-light plant, including the erection of a new smokestack and installation of water equipment.

JONESVILLE, MICH.—The Board of Public Works contemplates the installation of a motor-driven centrifugal pump (200 gal. per minute), motor 20 hp., 440 volts, three-phase, 60 cycles, to replace one of two steam fire pumps now in use. R. S. Newton is superintendent.

LAWTON, MICH.—Plans are being considered for changes in the pumping equipment of the municipal electric-light and water-works plant in the near future. As yet nothing definite has been decided upon. R. W. Brown is engineer power station.

MARSHALL, MICH.—The Board of Electric Light and Water Commissioners is considering some changes at the municipal electric-light plant, which will increase the efficiency of the waterwheel equipment. Details have not yet been worked out. P. S. Joy is superintendent.

MILFORD, MICH.—The Milford Electric Company is installing another 30-hp. water wheel on Pettibone Creek in Milford and will operate a motor in connection with generator. F. S. Hubbell is proprietor.

OVID, MICH.—The village of Ovid will soon purchase two 250-hp. water-tube boilers and electrically-driven pumps. Fred G. Davis is superintendent.

PETOSKEY, MICH.—Improvements are being made to the municipal electric-light plant, including the installation of two 75-kw. umbrella type generators, directly connected to waterwheels located at the municipal water-works plant further down the river; water is conveyed to this point. The discontinuance of the direct-current service is contemplated upon the completion of the new plant. J. E. Niles is city clerk and purchasing agent.

PORTLAND, MICH.—The Board of Public Works is planning to install an ornamental lighting system next April and May, consisting of 42 single-lamp posts. G. A. Knox is president of board.

ST. CHARLES, MICH.—The Board of Public Works is planning to install a new series street-lighting system in the spring. David G. Howey is superintendent.

STURGIS, MICH.—The Board of Public Works contemplates the installation of a 500-kw. auxiliary generating unit, either oil or steam, during the coming year. J. S. Flanders is manager.

CINCINNATI, OHIO.—The City Council has granted the Cincinnati, Lawrenceburg & Aurora Electric Street Railroad Company a franchise to construct a street railway from Cincinnati to Anderson Ferry.

CLEVELAND, OHIO.—The Willard Storage Battery Company, it is reported, contemplates the construction of an addition to its plant, 100 ft. by 135 ft. Bids for the work, it is understood, will soon be asked for.

CLEVELAND, OHIO.—Improvements are contemplated to the municipal electric-light plant, involving an expenditure of about \$700,000. The proposed work will include the installation of switchboard, generator, boilers and engines.

CLEVELAND, OHIO.—Bids will be received at the office of commissioner of purchases and supplies, City Hall, Cleveland, Ohio, until Jan. 25, for coal storage bunker for the division of light and heat. Specifications may be obtained at the office of division of light and heat.

PENINSULA, OHIO.—The Moody &

Thomas Milling Company is reported to be considering the construction of a new electric power plant, to replace the one recently destroyed by fire.

PUTTICE, KY.—The South Kentucky Power Company contemplates erecting an electric transmission line to Lebanon, Tenn., to furnish electrical service in Watertown and Alexandria. The company has a plant in Watertown which supplies electricity there and in Alexandria.

MAYSVILLE, KY.—The new steam turbo-generating plant of the Maysville Power Company will be finished and put in operation in about two months. When completed the plant will furnish electricity for the entire systems of the Maysville Gas Company and the Maysville Street Railroad & Transfer Company. The present power plant of the Maysville Gas Company will be held intact for use in emergencies. Horace J. Cochran is president and manager of the Maysville Gas Company.

WALTON, KY.—The Walton Electric Light Company contemplates the purchase of a generator to be directly connected to engine, already installed; also to erect a 10,000-gal. oil storage tank. E. L. Kelly is owner and manager.

WILLIAMSBURG, KY.—The Williamsburg Electric Light Company is contemplating establishing a 24-hour service. H. L. Bryant is secretary and general manager.

CRAWFORDSVILLE, IND.—The Crawfordville Electric Light & Power Company (municipal) is installing a 350-hp. Stirling boiler. F. H. Miller is manager.

HAGERSTOWN, IND.—The new City Council, it is understood, will take action in establishing a 19-hour or 24-hour service soon after taking oath of office. The municipal electric light department will be in the market for a new engine and generator, directly connected, at an early date; the engine will be of the fuel-oil type, with rating from 125 hp. to 200 hp.; generator will be 220-volt, two-wire, complete with switchboard. R. G. King is manager.

LA GRANGE, IND.—The La Grange County Light & Power Company is contemplating the installation of a new 400-hp. Fitchburg engine and changing the plant from 133 cycles, single phase, to 60 cycles, three phase, next summer. L. G. Young is superintendent.

BELLEVIEW, ILL.—The St. Clair County Gas & Electric Company is trying an experiment in the use of natural gas to replace coal. Should the tests prove successful the company will ask the Illinois Public Utilities Commission for permission to make the necessary changes in its plant.

BLOOMINGTON, ILL.—A 600-kva. turbo-generator set will be installed in the municipal electric-light plant as soon as conditions become normal. C. C. Williams is superintendent.

CHICAGO, ILL.—The capital stock of the Midland Electric Steel Company has been increased from \$40,000 to \$100,000.

CHICAGO, ILL.—The Lincoln Park Commissioners contemplate the installation of a 500-kw., three-phase, 2300-4000-volt turbo-generator for heating system; also 300 additional 400-cp. type C park lamps, on concrete poles, and arranging all multiple circuits to regulated type. Claude H. Shepherd is electrical engineer.

ELBURN, ILL.—Preparations are being made to install a Westinghouse 50-kva., single-phase, 60-cycle, 1100-volt generator in the municipal electric-light plant. Machinery has already been purchased. A. S. Sharp is superintendent.

FISHER, ILL.—The construction of a new electric plant changing from steam to oil equipment is under consideration by the Town Board. Nothing definite has been decided upon. A. L. Baker is engineer.

GOLCONDA, ILL.—The Golconda Light & Water Company contemplates the installation of a 25-kw., three-phase, 2300-volt generating unit, directly connected. Nothing definite has yet been decided on. R. H. Williamson is secretary and manager.

GRAYVILLE, ILL.—The Electric Light Commissioners are installing an ornamental street-lighting system, consisting of 11 ornamental standards mounted with one 100-cp. and four 80-cp. lamps. C. Richards is superintendent.

LA SALLE, ILL.—Plans are now being prepared for the installation of a 250-hp. engine to operate arc machines. E. Byrne is city engineer.

MILLSTADT, ILL.—Preparations are being made to install a Chuse non-releasing Corliss engine, directly connected to a 72-kw. generator and an 80-hp. boiler, at the municipal electric-light plant. E. W. Marxer is Mayor.

PENDLETON, ILL.—Work is nearly

completed on the erection of 3 miles of electric transmission lines into the country. Alva Apple is superintendent of the municipal electric-light plant.

PERU, ILL.—Improvements to the municipal electric-light plant, consisting of the installation of a 200-hp. American Stumpf uniflow engine, directly connected to a 150-kva. General Electric three-phase, 60-cycle, 2300-volt generator and mechanical draft system, will be completed about Feb. 1. J. H. Hahn is superintendent.

SAVANNA, ILL.—The installation of a 625-kva. turbine is under consideration by the People's Gas & Electric Company. F. P. Bowen is manager.

STAUNTON, ILL.—The car barns and repair shops of the Illinois Traction System were recently destroyed by fire, causing a loss of about \$35,000.

STRONGHURST, ILL.—The new electric plant of M. F. T. Schierbaum was put into operation Jan. 5. The equipment consists of a 75-kw., single-phase, 60-cycle Royal Electric generator, with exciter; a 75-hp. Frost engine and an 80-hp. Frost boiler. The old plant was destroyed by fire on Nov. 10, 1917.

WINNETKA, ILL.—The installation of a Manistee Roturbo condenser in the municipal electric-light plant is under consideration. H. L. Woolhiser is manager.

MADISON, WIS.—Plans are being prepared for the erection of a substation on Sprague Street for the city. E. E. Parker is city engineer.

SHEBOYGAN, WIS.—Plans are being prepared by Juhl & Sixta of Sheboygan, architects, for an addition to the power house of the Badger State Tanning Company.

BLOOMINGTON, MINN.—Contract has been awarded for electric wiring of the Consolidated School Building to the Sterling Electric Company, 33 South Fifth Street, Minneapolis, at \$2,773.

VIRGINIA, MINN.—C. E. Nystrom, architect, has been authorized to advertise for bids for electrical work for the new school building. The cost is estimated at about \$10,000.

ALGONA, IOWA.—New equipment is being installed in the municipal electric-light plant, consisting of a 200-hp. oil engine and a 170-kva. General Electric generator. When completed the system will be changed from 1150 volts to 2300 volts. J. W. Kelly is superintendent.

BLOOMFIELD, IOWA.—Two new electric generators, one 225-kw. and one 75-kw. alternating current, will be installed in the municipal electric-light plant this year. Improvements, including the installation of two 150-hp. boilers and erection of brick smokestack, were made to the plant during 1917, at a cost of about \$8,000. T. Z. Millard is general superintendent.

CEDAR RAPIDS, IOWA.—Extensions are contemplated by the Iowa Telephone Company, including the installation of approximately 30 blocks of conduits, tile, etc., and improvements to telephone exchange, to cost about \$40,000. J. M. Rider, 319 South Second Street is manager.

CORYDON, IOWA.—The installation of a new generator in the municipal electric-light plant is under consideration by the electric light committee. A. T. Gallagher is clerk.

DES MOINES, IOWA.—Plans have been prepared, it is reported, by the Inter-Urban Railway Company for the construction of a four-story terminal station in Des Moines, to cost about \$200,000.

EMMETSBURG, IOWA.—The Northern Iowa Gas & Electric Company contemplates extending its electric transmission line to Dickens.

ST. ANSGAR, IOWA.—The Light & Power Company of St. Ansgar is contemplating the development of a new water power this year. O. H. Koch is secretary.

PLATTSBURG, MO.—The Clinton County Telephone Company contemplates improvements to its system, to cost about \$15,000.

LESTERVILLE, S. D.—The proposal submitted by Otto S. Olson for the installation of an electric-lighting system in Lester-ville, to cost about \$8,000, has been accepted by the Town Board.

BANCROFT, NEB.—Bids will be received until Jan. 31 for construction of a complete electric system, water-works extensions and municipal building, to cost approximately \$39,700. The Electrical Development, Frances Building, Sioux City, Iowa, is engineer.

TECUMSEH, NEB.—The City Council is considering the purchase of an engine for the water-works plant.

OAKLEY, KAN.—Plans are being considered for the installation of a new generating unit in the municipal electric-light plant, consisting of (probably) 150 to 175

up, to replace the present engine. Not yet definitely decided upon; also for a new well and motor. Grant Maurer & Son are engineers. W. B. Day is superintendent.

KINSLEY, KAN.—The Kinsley Electric Light & Power Company is erecting an electric transmission line (a total of 30 miles) to Garfield. A. L. Moe is owner and manager.

SABETHA, KAN.—The City Council is planning to change equipment of the municipal electric-light plant from single to three phase system. C. A. Darby is city engineer.

STOCKTON, KAN.—New equipment, including one 200-hp. Fairbanks-Morse engine (oil burning) and a 170-kva. generator, directly connected, is now being installed in the municipal electric plant. F. A. Chipman is city clerk and purchasing agent.

WELLINGTON, KAN.—The city of Wellington contemplates purchasing 100 water meters to complete metering all service. Specifications have been completed for the immediate construction of a 500,000-gal. reservoir, five new wells and installation of five low-pressure pumps, necessary piping and electrical equipment. J. R. Murphy is superintendent of public utilities.

WILSON, KAN.—Plans are being prepared by A. A. Potter, dean of engineering department, State Agricultural College, Manhattan, for extensions to the municipal electric-light plant, to consist of the installation of one 150-hp. uniflow engine directly connected to three-phase, 2300-volt generator, together with two 80-hp. horizontal return tubular boilers. J. H. Williams is superintendent.

Southern States

ABBEVILLE, S. C.—The Abbeville Cotton Mills, it is reported, will receive bids for electric wiring of 100 cottages.

LOCKHART, S. C.—Plans are being prepared for the construction of a hydroelectric power plant for the Lockhart Power Company, a subsidiary of Monarch Mills. Elmsie Nicholson of Union, S. C., is treasurer of Monarch Mills.

AMERICUS, GA.—Owing to an increased price for street-lighting service under a proposed new contract with the Americus lighting company, steps have been taken to establish a municipal electric-lighting plant in Americus. The contract for street-lighting will soon expire.

ATLANTA, GA.—With a view of improving the street car line service from Buckhead to Camp Gordon, the Georgia Railway & Power Company proposes to double-track the railway to a point near the intersection of Piedmont Road and Peachtree Road.

ATLANTA, GA.—The Doss Rubber Company contemplates the construction of a plant to manufacture inner tubes, which will be equipped for electrical operation. The company, it is reported, is in the market for motor-driven calenders and miscellaneous motor-driven machinery.

ATLANTA, GA.—Arrangements have been made by the Southern Railway Company to secure energy from the Georgia Railway & Light Company of Atlanta to operate its Inman yards shops. Electricity will be used for a signal system, air compressors, round house and lighting the yard.

BLAKELY, GA.—A two-story cold storage warehouse is being erected to be operated in connection with the municipal ice plant. E. R. Adams is superintendent.

COCHRAN, GA.—The town officials are considering extensions and improvements to the municipal electric-light plant and water-works system, to cost about \$5,000, this year. Nothing definite has been decided upon. C. W. Davis is superintendent.

CORNELIA, GA.—Preparations are being made by the Wofford Shoals Light & Power company to furnish electrical service in Parkville, consisting of twenty 100-watt street lamps and 50 meter customers. The company is also considering extending its transmission line to Lula, Ga., soon. J. A. Wells is secretary and treasurer.

ELBERTON, GA.—Improvements are being made to the municipal water and electric plant, including the installation of a 50-hp. centrifugal pump to replace the steam pumps. G. F. Cleveland is general superintendent.

KENNESAW, GA.—J. G. Lewis has contracted with the Georgia Railway & Power Company of Atlanta for electricity to operate the local system. An electric transmission line will be erected from Kennesaw to connect with the high-tension line of the company.

PORTLAND, GA.—The American Potash company has contracted with the Georgia Railway & Power Company of Atlanta, to

furnish energy to operate fuller mills for the extraction of potash for sericite. The contract calls for 200 kw.

WAYNESBORO, GA.—Improvements are contemplated to the municipal electric-light plant, including the installation of one 200-hp. boiler, one 100-kw., three-phase, 60-cycle, 2300-volt generating unit, directly connected, with switchboard complete. J. C. Andrews is superintendent.

ORLANDO, FLA.—The Orlando Water & Light Company is planning to install a 1000-kw. General Electric turbine this summer. Donald A. Cheney is general manager.

PRESSMEN'S HOME, TENN.—The Clinch River Hydro-Electric Company is building a hydroelectric plant on Richardson's Creek, near Clinch River, at a cost of about \$60,000. The plans provide for a development of about 1000 hp. and the erection of 9 miles of electric transmission lines. All contracts for machinery have been awarded. John N. Adams of Charleston, Tenn., is engineer. George L. Berry is president.

FORT MORGAN, ALA.—Contract has been awarded by the War Department to Jett-Muths Construction Company of Mobile for the erection of nine cantonment buildings for coast artillery companies, including electric lighting, sanitary plumbing, drainage systems, etc.; also for building railroad extension to cantonment.

GENEVA, ALA.—Plans are being considered by the Geneva Power Manufacturing Company for the construction of a hydroelectric plant on Double Bridge Creek. As yet definite plans have not been decided upon.

TUSCALOOSA, ALA.—The Tuscaloosa Railway & Utilities Company is building an engine room, 60 ft. by 95 ft., and a car barn, 44 ft. by 167 ft. I. W. Ross is vice-president and general manager.

COLUMBUS, MISS.—The trustees of the Mississippi Industrial Institute and College are considering a bond issue for the erection of a power house and other buildings, to cost about \$175,000. H. L. Whitfield is president.

FORT SMITH, ARK.—The Fort Smith Light & Traction Company has been awarded a contract for furnishing an ornamental lighting system on Garrison Avenue for a period of ten years. The contract calls for the installation of 74 lamps of 400 cp. mounted on steel poles.

OSCEOLA, ARK.—The town officials are contemplating the installation of a 200-kva. generating unit in the municipal electric plant during the coming summer. Ed. Teaford is manager.

BLANCHARD, OKLA.—The City Council is considering the installation of an electric-lighting system.

DOVER, OKLA.—The installation of an electric-lighting system in Dover is reported to be under consideration by the City Council.

OKLAHOMA CITY, OKLA.—The International Cotton Picker Corporation, it is reported, is in the market for electric equipment for a cotton picker manufacturing plant. Fred W. Barnacio of Oklahoma City is manager.

WOODWARD, OKLA.—At an election held recently the proposal to issue \$20,000 in bonds for the installation of a municipal electric-light plant was carried.

Pacific and Mountain States

POT GAMBLE, WASH.—Preparations are being made by the Puget Mill Company for the installation of a 1000-kw. steam turbo-generator unit. Contract for machinery has been placed with the Allis-Chalmers Manufacturing Company, Milwaukee, Wis. A. B. Pracna, of Seattle, is consulting engineer.

SEATTLE, WASH.—Plans are being prepared for the erection of a substation for the City Lighting Department at West Forty-ninth Street and Fourteenth Avenue. N. W. The building will be 66 ft. by 66 ft., one and two stories high, and will cost about \$75,000. Daniel Huntington is city architect.

SEATTLE, WASH.—Work, it is understood, will soon begin on the construction of an electrically operated steel mill on Puget Sound, near Seattle by interests connected with the Alaska Gastineau Mining Company, to cost about \$25,000,000, of which \$9,000,000 will be expended on the initial installation. B. L. Thane, S. F. B. Morse, W. H. Crocker, of San Francisco, and others are interested.

SEATTLE, WASH.—D. F. Houston, Secretary of Agriculture, in a communication to the City Council, states that if the city

of Seattle can give satisfactory assurances that it intends to and is in a financial position to make immediate development of the power site of the Skagit River in the Washington National Forest, about 100 miles from Seattle, the Department of Agriculture will give the city a permit to construct the plant. The maximum development is estimated at 200,000 kw. Although the present plans provided for in the \$5,000,000 bond issue, authorized by the Council recently, directs that the Board of Public Works shall call for bids for a completed project in some national reserve, anticipating that bids would be received on the Diablo project, when the city would acquire the rights from the government, in the event no bids are received on the project, the Board of Public Works is given authority to construct the plant by day labor. The Diablo Canyon power project is located on the Skagit River. To reach it a transmission line about 135 miles will be needed. The City Council is also considering the Stillaguamish River power site offered to the city for \$800,000 by the Skykomish Power Company.

PORTLAND, ORE.—The Northwestern Electric Company, Pittcock Block, has awarded contracts for the immediate construction of an additional plant in Portland, which will increase its output by 50 per cent. Wilber E. Coman of Portland is vice-president and general manager.

BLACKFOOT, IDAHO.—The City Council is considering the installation of an ornamental lighting system.

REDSTONE, MONT.—Plans are being considered for rebuilding the local electric-lighting plant, including the installation of new machinery. S. J. Dorothy is reported interested.

CASPER, WYO.—The power plant of the Natrona County Electric Company was recently destroyed by fire, causing a loss of about \$150,000.

ASPEN, COL.—The Roaring Fork Electric Light & Power Company is installing an additional generating unit, consisting of a 400-kv. General Electric, direct-current, 600-volt generator directly connected to a 700-hp. Pelton-Doble waterwheel. C. E. Doolittle is manager.

DENVER, COL.—The Denver Tramway Company is planning to equip the Gold Division from Gravel Spur, a distance of about 4 miles, for electrical operation, using the third-rail system.

Canada

FORT WILLIAM, ONT.—Tenders, it is reported, will be called for the construction of a tunnel under the Kaministiquia River for the purpose of carrying water mains, electric light, power and telephone cables. The cost is estimated at \$150,000.

MONTROSE, ONT.—The Hydro-Electric Power Commission is building a railway from the Welland River, near Montrose, around Niagara Falls City to the Niagara River near Queenston, a distance of about 12 miles, in connection with the Chippewa-Queenston power canal. About 8 miles, it is reported, have been completed at the northern end of the line. F. A. Gaby, chief engineer of the commission, has charge of the work.

WIARTON, ONT.—Estimates are being prepared by the Hydro-Electric Power Commission of Ontario of the cost of the installation of an electric-light and power system in Wiarton.

LUMSDEN, SASK.—The purchase of the local electric-light plant, at a cost of \$7,000, is under consideration by the Town Council.

Miscellaneous

PANAMA.—Bids will be received at the office of the purchasing officer, the Panama Canal, Washington, D. C., until Jan. 24 for furnishing (under circular 1193) the following supplies: steel, iron, wire, steel cable, oil-burning ranges, electric griddles, refrigerating apparatus, etc. For further information address A. L. Flint, general purchasing officer.

PANAMA.—Bids will be received at the office of the general purchasing officer, the Panama Canal, Washington, D. C., until Feb. 2 for railroad track scale, pressure gages, marine clock, thermometers, steam traps, air compressor, tandem, link pins, cable clips, pipe fittings (black, galvanized and brass), steam cocks, stop cocks, valves, etc. Blanks and information pertaining to this circular (1195) may be obtained at the above office or the offices of the assistant purchasing agents, 24 State Street, New York, N. Y., Audubon Building, New Orleans, La., and Fort Mason, San Francisco, Cal.

(Issued Dec. 26, 1917)

- 1,250,952 TROLLEY-WIRE HANGER; Floyd G. Hayward, Mansfield, Ohio. App. filed July 31, 1916. More particularly for lines where catenary construction is used.
- 1,250,961 TELEGRAPHY; William M. Bruce, Jr., Springfield, Ohio. App. filed Feb. 12, 1915. As applied to submarine cables or conductors of high capacity.
- 1,250,978 METHOD OF CHARGING AND UTILIZING STORAGE BATTERIES; John H. Crevellink, Auburn, N. Y. App. filed May 17, 1915. Improvements.

1,251,097—Strain Insulator

- 1,251,005. ELECTRIC BATTERY; Harry E. French, Fremont, Ohio. App. filed July 20, 1915. Arrangement for preventing upward displacement or bulging of the seal in a cell.
- 1,251,013. INSULATOR JOINT; Walter T. Goddard, Hamilton, Ontario, Canada. App. filed April 4, 1916. Pin-supported type.
- 1,251,023. AUTOMATIC TELEPHONE SYSTEM; Harry E. Hershey, White Water, Kan. App. filed Nov. 28, 1913. Means employed for selecting an idle trunk.
- 1,251,037. LIGHTNING-PROTECTIVE ATTACHMENT FOR OIL TANKS AND OTHER STRUCTURES; Francis B. Jackson, Tulsa, Okla. App. filed Aug. 5, 1915. Improvements.
- 1,251,060. HEATER; Joseph A. Lesperance, Montreal, Quebec, Canada. App. filed June 8, 1916. Adapted to be inserted into a body of water for raising the temperature of the water.
- 1,251,097. STRAIN INSULATOR; John M. Peck, Victor, N. Y. App. filed Jan. 25, 1917. High tension.
- 1,251,116. ELECTRIC BOILER; Ora E. Sarr, Ceylon, Ohio. App. filed May 25, 1917. Means for suspending electrode plates within the boiler.
- 1,251,120. SWITCHING APPARATUS; William M. Scott, Tredyffrin Township, Chester County, Pa. App. filed April 8, 1915. Comprising a plurality of switches or circuit breakers.
- 1,251,126. HIGH-TENSION RECTIFYING APPARATUS; Homer C. Snook, Oak Park, Ill. App. filed April 13, 1909. Switch.
- 1,251,159. SAFETY SWITCH; Richard Wolfsberg and Sidney C. Smith, Los Angeles, Cal. App. filed April 30, 1917. Fuses are stationary and are separate from the switch members proper.
- 1,251,165. SIGNAL DEVICE FOR VEHICLES; Harry M. Addison, San Diego, Cal. App. filed Dec. 4, 1918. Improvements.
- 1,251,171. SECONDARY CLOCK; Lawrence O. Beard, Lancaster, Pa. App. filed Aug. 6, 1915. Electrically controlled escapement mechanism thereof.
- 1,251,178. ELECTRIC SWITCH; Charles W. Brockett, Brooklyn, N. Y. App. filed Jan. 18, 1916. Key socket.
- 1,251,181. AIR-BRAKE SYSTEM FOR TRUCKS; Elbert G. Chandler, Portland, Ore. App. filed Oct. 23, 1913. Unit air-brake mechanism or apparatus.
- 1,251,190. INDICATING AND RECORDING SYSTEM; Amos F. Dixon, Newark, N. J. App. filed June 21, 1915. Remote-control type.
- 1,251,194. LIGHTNING ARRESTER; Robert B. Dyer, Waurika, Okla. App. filed Jan. 4, 1917. Telephone.
- 1,251,208. ALTERNATING - CURRENT TELEGRAPH AND TELEPHONE DUPLEX; John P. Ferriter, Jacksonville, Fla. App. filed Sept. 20, 1916. Provision of a junction coil of special construction.
- 1,251,210. ELECTRICAL WATER HEATER; Ida R. Forbes, Los Angeles, Cal. App. filed June 24, 1916. For douches.

Record of Electrical Patents

Notes on United States Patents

- 1,251,216. IMPULSE STARTER; Eugene Gassmann, Brooklyn, N. Y. App. filed Jan. 26, 1917. Electrical ignition devices for internal-combustion engines.
- 1,251,217. IGNITION DEVICE FOR INTERNAL-COMBUSTION ENGINES; Eugene Gassmann, Brooklyn, N. Y. App. filed March 14, 1917. Improvements.
- 1,251,219. TELEPHONE-CALL-CHARGE SYSTEM AND APPARATUS; Charles L. Goodrum, New York, N. Y. App. filed May 10, 1915. Automatic telephone systems.
- 1,251,224. CIRCUIT BREAKER; Carl K. Gustafson, Springfield, Mass. App. filed Dec. 3, 1913. Used in connection with an ignition system for a hydro-carbon engine.
- 1,251,249. COMBINED TIMER, DISTRIBUTOR AND CURRENT-REVERSING DEVICE; Joseph H. Lehman, New York, N. Y. App. filed Jan. 18, 1915. Improvements.
- 1,251,269. RECTIFIER; Harry A. Mulvany and Harry E. Kennedy, Berkeley, Cal. App. filed Nov. 24, 1915. Plate type.
- 1,251,283. ILLUMINATING SIGN; George R. Pyer, Midvale, Utah. App. filed March 20, 1917. Sign is constructed with translucent portions which are illuminated from behind, members with rotating blades being mounted between the illuminating means and the translucent portions of the sign.
- 1,251,286. CONTROLLER FOR POWER-OPERATED DEVICES; Thomas H. Rodman, New York, N. Y. App. filed March 3, 1911. For printing presses.
- 1,251,294. SWITCHING APPARATUS; William M. Scott, Tredyffrin Township, Chester County, Pa. App. filed June 22, 1915. Applies particularly to apparatus for switching or controlling heavy electric currents such as are used in electric lighting and electric power practice.
- 1,251,302. ELECTRIC RECOVERY OF METALS FROM THEIR SOLUTIONS; Uryin C. Tainton, Johannesburg, Transvaal, South Africa. App. filed July 6, 1915. Improvements.
- 1,251,312. CIGAR AND CIGARETTE LIGHTER; Martha Wenzel, Jacksonville, Fla. App. filed Jan. 3, 1917. Improvements.
- 1,251,314. IGNITION SYSTEM; Ernest C. Wilcox, Meriden, Conn. App. filed Aug. 17, 1915. Relates to engines having a relatively large number of cylinders.
- 1,251,320. TELEGRAPH CIRCUIT-CLOSING AND SIGNALING SYSTEM; Frederick A. Anderson, Portage la Prairie, Man., Canada. App. filed March 2, 1917. Improvements.
- 1,251,350. TELEPHONE SYSTEM; Gerald Deakin, San Francisco, Cal. App. filed May 13, 1912. Automatic.
- 1,251,363. SIGNALING SYSTEM; Bancroft Gherardi, Bayhead, N. J. App. filed Aug. 31, 1915. In connection with telephone systems.
- 1,251,364. SIGNALING SYSTEM FOR MULTIPLEX TELEPHONE CIRCUITS; Bancroft Gherardi, Bayhead, N. J. App. filed Nov. 24, 1916. Improvements.
- 1,251,365. PERMUTATION LOCK; William C. Gilmore, Chicago, Ill. App. filed May 25, 1917. Capable of manipulation from a distant point.
- 1,251,366. THERMO-ELECTRIC FIRE-ALARM SYSTEM; Abilio M. Da S. Greaves, Cambridge, Mass. App. filed June 11, 1914. Thermostatic circuit closer.
- 1,251,377. METHOD OF AND MEANS FOR OBTAINING CONSTANT DIRECT-CURRENT POTENTIALS; Albert W. Hull, Schenectady, N. Y. App. filed Dec. 22, 1915. Improvements.
- 1,251,378. CRYSTALLINE OR LIKE DETECTOR FOR ELECTRIC WAVES; Horace Hurm, Paris, France. App. filed April 12, 1917. Consists in replacing the single contact by a device with multiple but independent contacts distributed over the surface of the detector substance employed.
- 1,251,388. METHOD OF AND APPARATUS FOR CONTROLLING X-RAY TUBES; Irving Langmuir, Schenectady, N. Y. App. filed Oct. 29, 1913. Improvements.

- 1,251,411. ELECTRIC HEATER; James O'Connor, New York, N. Y. App. filed June 28, 1916. Immersion.
- 1,251,412. SECONDARY STORAGE BATTERY AND METHOD OF MAKING THE SAME; Charles S. Palmer, Newtonville, Mass. App. filed July 23, 1915. In which the electrolyte remains substantially constant in strength and action for prolonged periods of time owing to the auto-regeneration of the battery.
- 1,251,416. INSULATOR; Benjamin S. Purkey, Tacoma, Wash. App. filed May 4, 1914. Improved means for retaining an insulated wire in position.
- 1,251,419. STATION INDICATOR; Earle H. Reynolds, Black Creek, N. Y. App. filed Nov. 9, 1915. For use in connection with street railways.
- 1,251,438. INSULATOR; Oscar O. Stone, San Antonio, Tex. App. filed May 31, 1917. For use in connection with water pipes.
- 1,251,440. CONDENSER SWITCH; Morton Sultz, Brooklyn, N. Y. App. filed Dec. 20, 1915. Device by means of which the number of condenser elements present shall be materially reduced, but which will still permit of a complete step-by-step adjustment between certain limits of capacity.
- 1,251,446. REGULATOR; Louis W. Thompson, Wilkensburg, Pa. App. filed March 22, 1913. For automatically regulating the effect of a resistance by intermittently short-circuiting the same.
- 1,251,452. STORAGE BATTERY; Irvine M. Noble and Walter E. Gossling, Indianapolis, Ind. App. filed Aug. 23, 1917. Covers for the cells of storage batteries.

(Issued Jan. 1, 1918)

- 1,251,472. ATTACHING MEANS FOR IGNITION BREAKER BOXES; William J. Brown, Newark, N. J. App. filed May 14, 1917. For use in connection with an inductor type of magneto.
- 1,251,485. PROCESS OF TREATING SULPHIDE ORES OR LEAD; Robert De Luce, Oakland, Cal. App. filed May 8, 1917. Hydrometallurgical process.
- 1,251,497. FLOOR OUTLET BOX; James M. G. Fullman, Pittsburgh, Pa. App. filed Nov. 17, 1908. Permits the ready insertion and removal of the receptacle.
- 1,251,504. MACHINE-SWITCHING TELEPHONE-EXCHANGE SYSTEM; Charles L. Goodrum, New York, N. Y. App. filed Aug. 23, 1915. Provides means associated with the connector for instantly applying current from a ringing generator to the called line when the connector is set thereon.
- 1,251,505. TELEPHONE-EXCHANGE SYSTEM; Charles L. Goodrum, New York, N. Y. App. filed Dec. 30, 1916. Improvements.
- 1,251,507. CURRENT-CONTROLLING MECHANISM FOR AUTOMOBILE LIGHTS; Wilbur A. A. Gray, Canonsburg, Pa. Headlights.

1,251,452—Storage Battery

- 1,251,511. PROCESS OF ELECTROLYTICALLY SEPARATING NICKEL FROM COPPER; George A. Guess, Oakville, Ontario, Canada. App. filed Aug. 14, 1917. A substantially insoluble reagent is employed which will react with copper sulphate to form an insoluble copper compound, and, preferably, an insoluble sulphate or a sulphate the presence of which in the electrolyte is not prejudicial.
- 1,251,516. SIGN-MAKING APPARATUS; Rudd Hardesty, Denver, Col. App. filed April 21, 1915. Improvements.
- 1,251,517. AUTOMOBILE SIGNAL; George L. Harris, Memphis, Tenn. App. filed Aug. 30, 1916. Improvements.
- 1,251,536. TELEPHONE SYSTEM; Charles W. Keckler, Newark, N. J. App. filed Nov. 16, 1915. House or intercommunicating systems.

Number 4

Saving Fuel Supplies for the War

THE Fuel Administrator, with full confidence that it is necessary to the war, has issued an order abruptly closing industries for five days and for nine following Mondays. There is no disposition or desire to haggle over the question of his legal authority. At war, the industries patriotically comply with wishes or orders of the constituted authorities. Production is stopped, employees take enforced holidays. These are the surface facts that we see. What we do not know, because in war time all facts cannot be public, is the underlying condition which led Dr. Garfield to catapult this requirement into the intensified industrial activity of the nation. Part of it he has told, and no loyal man will raise a dissenting whisper against the explanation that coal must be provided for ocean steamships held in harbors by lack of fuel. Their needs are a first call.

In addition to this vital emergency of coaling the ships is the domestic railroad tangle, made far more serious by a succession of blizzards and zero temperatures in congested traffic districts. Until railroad and terminal are restored to normal flexibility we shall get 50 per cent result or less out of 100 per cent effort. If the arrest of industry order leads to a large degree of improvement in freight handling, it will be a wholesome return, well worth the sacrifice it costs. Let us pin hope to the prospect that raw materials and manufactured products will have better railroad transportation after the "workless" days are over.

With central stations, of course, the effect of the order is immediate. Filling their function as public utilities, they have no alternative but to continue to put energy on the lines, though generating in smaller volume. Compliance with the order is the duty of consumers and power will be cut off wherever violations are seen. The restriction upon manufacturing industries with its instant curtailment of power consumption automatically brings fuel saving, which is the paramount thing. It also cuts revenue, gross and net, of the electric utilities. How great a saving of coal will follow cannot be determined from the experience of any one company, it varies so widely with the load and the proportion of essential war industries. As indispensable industries, essential in both war activities and to the great body of consumers in other industries and in homes, public utilities are placed high on the list of those to whom more adequate coal supply is promised by the regulation. Many of them are suffering keenly from coal shortage, and to these relief is welcome.

The Fuel Administration has evidently abandoned, at

any rate for the time being, all thought of discriminating sharply between essential and non-essential industries. It is clear that a more drastic program, promising direct relief without delay, was regarded as necessary. Any measures which are in the national interest will be accepted patriotically. But, looking to the future, may we venture to recall to the Fuel Administrator that the energies of his organization, from first to last, have been directed more to cutting down consumption than to any other policy? There is another line of action which we respectfully submit for the thoughtful examination of the authorities. It is that less attention be paid to restriction of coal consumption, that more attention be given to stimulating coal production. Cannot the national Fuel Administration, with all of its great influence and power, turn earnest, resourceful vigor in 1918 to the question of stimulating production of coal; in brief, concentrate upon coal production, making that the major note in its policy and letting the limitation of consumption fall back to a secondary place?

A Genuine High-Pressure Steam Plant

ELSEWHERE in this issue is published an article on the design and construction of one of the first central generating stations in this country to operate at 300 lb. (21.1 kg.) steam pressure. This plant is feeding energy into the transmission system of the Public Service Company of Northern Illinois. It is one of about thirteen plants which are now serving thirteen counties. As it grows from its present rating of 10,000 kw. to its ultimate rating of 60,000 kw. it will no doubt absorb a greater and greater portion of the system load.

The efficiency of a plant with such a future facing it is a vital consideration, and so the efficiency of this Joliet plant is a matter of much interest. Tests to determine just how cheaply the plant will produce energy have not yet been made. The increase in efficiency gained by the high steam pressure is, therefore, as yet open only to estimate. It is considered quite probable, however, that the over-all boiler efficiency under operating conditions may exceed 80 per cent, a gain of 5 per cent over the best average practice to-day. In the turbine the 100-lb. (7-kg.) additional pressure should theoretically make possible a further gain of between 6 per cent and 7 per cent, giving a steam consumption that will compare favorably with that of the largest unit now in service. So, judging from facts that are known and allowing for the usual discrepancy between theoretical and obtainable economies, it does not seem

unreasonable to expect this new plant to produce a kilowatt-hour on 18,000 B.t.u.

Against this increase in economy must be charged the additional investment. It has been estimated that boilers for this high pressure cost about 20 per cent more than those designed for pressures close to 200 lb. (14.1 kg.). The increased cost of the turbo-generator was probably not so great as this. Owing to the small diameters, the piping valves and fittings are probably no more expensive than for pressure around 200 lb. An analysis of actual figures should show a net advantage to the plant well worth while. The final answer as to whether high steam pressure pays will probably be most easily obtained by watching for the advent of more plants of this general design after the engineers have had an opportunity to observe this plant in service.

In addition to operating at high pressure, this plant is one of the first to reach an operating steam temperature around 650 deg. At the Buffalo General Electric plant the steam temperature is 689 deg., obtained from a steam pressure of 275 lb. (19.3 kg.). In the present case the superheat is less by 50 deg., but the pressure is greater, being 300 lb. (21.1 kg.) at the turbine and enough higher at the boiler to insure the above density. It is probable that the boiler pressure will approximate 325 lb. (22.9 kg.), the design still allowing an additional 25 lb. (1.75 kg.).

There appears to be some difference of opinion as to the choice of pressure or superheat in making up the total steam temperature. Theoretically the advantage is on the side of higher pressures, but here mechanical difficulties place restrictions. To obtain a temperature range such as exists at Joliet a compromise is necessary. Pressure up to the present mechanical limits is employed, and the superheat to increase the initial temperature and add to the efficiency is used. Other factors influencing the degree of superheat are steam density and condensation during expansion. Superheat reduces the density and lessens friction. It also tends to prevent liquefaction in the turbine and should increase with the pressure. It is evident, then, that pressure and superheat must go hand in hand, the ratio to be determined by existing conditions and the results obtained from practice.

While little trouble is expected in the turbine, as up to a certain point it is merely a case of using heavier construction at the first stage and perhaps additional stages to cover the wider range, it is different with boilers and fittings. At Joliet the limit in pressure has been reached for the standard design of large boiler. Experimental work is being conducted to develop boilers for the higher pressures, but some time must naturally elapse before any new design is ready for practical application.

While the arrangement of boilers and economizers at Joliet has been used for several years in some of the leading stations in Europe, it is new to this country, as is the use of the all-steel horizontal economizer. To withstand the high pressure steel is more reliable than cast iron, but more subject to corrosion from low-temperature flue gases. Galvanizing the tubes should neutralize this action.

The design of the unit calls for height in the building, but not so much as for the individual detached vertical-tube economizer placed in the same location. The above-ground basement is another factor adding

to the height, but this is counterbalanced to some extent by small overhead bunker capacity, calling for no additional height and minimizing the steel requirements. One great advantage of this arrangement is the elimination of ash-handling equipment. Another feature is the economical use of floor space. With backs retreating to the rear of the bridge-wall, the boilers require less than 0.5 sq. ft. (0.046 sq. m.) per nominal horsepower based on 10 sq. ft. (0.92 sq. m.) of heating surface. Taken as a whole, the plant represents modern practice with such changes as are necessary to permit the use of high pressure.

Alternating-Current Networks

IN COMPARATIVELY few cases is a purely alternating-current distribution carried out with the same attention to detail which experience has proved necessary in direct-current service. Alternating-current apparatus was originally developed with the idea of providing for scattered service which could not efficiently be reached in any other way, with the result that the early alternating-current plants were worked out with house-to-house transformers of small size, with short secondaries and with no attention whatever to the finer points of efficient distribution at uniform voltage. As time has gone on one great plant after another has become a huge hodgepodge of alternating-current and direct-current practice, growing up without scientific adaptation of means to ends. That an extensive alternating-current distribution can be carried out on sound engineering lines has been over and over again proved, but many of the attempts which have been made have not met with entire success.

S. Bingham Hood's paper in the current issue gives a general view of the situation from the alternating-current standpoint, bringing to the front the necessary characteristics of successful alternating-current distribution. The fundamental principles underlying it are that the transformer should be regarded as the equivalent of a direct-current feeder and the primary network supplying the transformers should be regarded as the equivalent of a substation bus on the direct-current system. The advantage of comparatively extensive systems of secondary mains is almost self-evident. Such construction is necessary in order to get uniform distribution of voltage and insure reliable service in the case of a single transformer giving out, as well as the full advantage of the diversity factor in the regions supplied. Mr. Hood's preference is for ring mains in a secondary service system, each one including a suitable amount of territory and provided with transformer service enough to avert serious overloading in case one transformer should fail. As the transformer overload commonly allotted is about 50 per cent, no independent secondary system should be fed by less than three transformers, and preferably it should be fed by more. With such an arrangement the blowing of a fuse at one transformer will not seriously interfere with the service on its particular secondary mains. The additional recommendation is made that the units be fairly large; in other words, that the system should be organized on a considerable scale. The object of this is obvious from the better characteristics of the bigger transformers and the more stable load obtained where a large number

of consumers are supplied from a single set of mains. How far these separate ring secondaries should be capable of interconnection is a matter which depends on local conditions.

Mr. Hood calls particular attention to the fact that proper cut-out equipment for secondaries of considerable output is not readily obtained. This is a lack which should be remedied. In fact, until quite recently proper primary cut-outs for the primary system were difficult to find; but this situation has been already remedied. Mr. Hood's preference is strongly for a primary network feeding the various groups of secondary networks. All that applies to the advantages of network connection on the secondary side also applies on the primary side, with the difference that still further care must be taken with respect to the interconnection of the primary network so that one fault may not involve a serious amount of territory. Provision must also be made for cutting out sections of the primary network in case, for instance, a serious fire occurs in the territory served. This is perhaps the most notable difference between alternating-current and direct-current network service. With the former it is imperative that the overhead high-tension wires should promptly be segregated in case of fire. In the latter the low-tension feeders and mains are very generally underground and do not constitute a serious danger in any event. A proper system of automatic cut-outs for use on the primary network is greatly to be desired and has not as yet been very thoroughly developed.

How far a system initially three-phase should be split up into the single-phase components, worked either two-wire or three-wire, is not easy to predict. Much will depend on the relative amounts of lighting and power service to be utilized within a given region. The logical arrangement for the preservation of uniform voltage and convenient distribution would seem to be the continuation of the three-phase network rather than extensive splitting into single-phase groups. No hard-and-fast rule can be drawn in the matter, however, since the local conditions must inevitably be taken into consideration. In short, the alternating-current network, like any other, must be laid out with the utmost care respecting the conditions of present and future demand.

The comprehensive general principle, however, that the transformer is a feeder to the low-tension network and must be treated as such is the basis from which network design must start. No two stations will present quite the same situation with respect to their supply lines on an alternating-current system, any more than they do on a direct-current system. The fundamental factor, however, is that with anything like the same care spent in alternating-current design that has been employed for years in direct-current design a wonderfully flexible, efficient and reliable organization of the supply can be effected. The earlier direct-current stations were driven to extreme care by the im-

perative necessity of doing fairly efficient work at low voltage over considerable distances. Free from this particular requirement, the alternating-current systems have generally received much less attention than they deserve. Hence the old commercial struggle between alternating current and direct current has not had the opportunity entirely to die out in its detailed influence, despite the fact that the larger part of every great supply station must be, and is even to-day, operated on alternating current.

Electrical Properties of Vulcanized Fiber

ONE of the well-known insulating substances used at the present time is vulcanized fiber. It is tough, strong, easily drilled or formed, and can stand exposure without disintegrating. At the same time, unlike glass or porcelain, it is slightly elastic and it is not brittle. Such a substance has a large scope of application in the electrical field.

The results of a number of tests for dielectric strength in various thicknesses and qualities of vulcanized fiber are presented in this issue by William Eves, 3d. These tests show how complex a property dielectric strength is. One might at first thought suppose that if a slab of dielectric 1 mm. thick had a rupturing emf. of, say, 12 kv., a slab of similar material 2 mm. thick would have twice the rupturing emf., or about 24 kv. As a matter of fact, it would have perhaps less than 20 kv. It always happens with solid dielectrics that as the thickness of a slab increases the volts per millimeter diminish. Experiment shows, however, that if a number of thin slabs, with surfaces of tinfoil, are tightly superposed to form a thick slab with thin parallel metallic layers throughout, the diminution in dielectric strength with increasing thickness is much less. Apparently the forced distribution of parallel equipotential surfaces throughout the mass of the dielectric enables the slab to support the electric stress better, even although it is evident that the rupture of any component slab immediately short-circuits it throughout by the conductive action of its tinfoil surfaces.

With this acknowledged non-conformity of dielectric strength in slabs of different thickness, it is evident that, in the presence of residual moisture or traces of chemical in the material, the effects of temperature upon the rupturing emf. of the material are likely to be different in different specimens, or even in the same specimen at different times. The results presented in the article point to such a generalization. However, if a suitable factor of safety is allowed to cover wide accidental variations, and if attention is given to mechanical and chemical specifications, there should be enough dielectric strength left available to meet practical requirements. The specifications mentioned in the article are instructive from this point of view.

THE nation-wide prominence drawn to the coal crisis by the order of the Fuel Administrator gives special value to the series of articles on the coal problem of electric central-station companies, which will be continued in next week's issue

The Coming Issues

of the ELECTRICAL WORLD. Another feature of the Feb. 2 issue will be the development of a new transmission-line formula and a chart which, used together, simplify transmission-line calculations without sacrificing their accuracy.

Corrective Steps for Our Coal Problem

Central-Station Companies Operating Steam Plants, Deeply Concerned Over the Critical Question of Coal Supply and Cost, Make Constructive Suggestions for Handling It—Views on Railroad Unification

ALTHOUGH the Fuel Administration has taken drastic action by closing industries to conserve fuel, the basic conditions are not improved by arrangements of this nature, designed to give only temporary relief. Central stations are looking and hoping for permanent improvement in the underlying conditions of coal supply and transportation; they believe that remedial measures are necessary in those directions and that temporary restriction of consumption alone will not give the desired results.

The question of whether companies are near to or far from coal-producing districts, the possibility of buying coal in the open market for part or all of the requirements, the number of railroad lines accessible and, in general, the railroad facilities depended on for getting coal affect the policy of steam electric central stations on the issue of coal supply. Therefore uniform corrective measures would not solve all problems of the companies reached in the survey made by the ELECTRICAL WORLD, although there is almost general agreement that improvement in transportation is vitally necessary.

A number of suggestions have been made and are published by the ELECTRICAL WORLD herewith. Some of them deal with such corrective steps as are now being worked out by the railroads under unified government control. They also point out emphatically the importance of conserving fuel by closing isolated plants and diverting their energy requirements to the more economical central station. The canvass indicates that the companies are in very close contact with the local and state fuel administrators in their localities. It is also clear that they are prudently looking beyond the immediate situation to introduce corrective steps when the easier summer-time conditions prevail.

DIFFICULTIES WITH LABOR

The opportunity to overcome the unwillingness of labor in mines to continue to work steadily is discussed by one company. "Our experience is that one of the chief difficulties in the fuel situation is the failure of the miners themselves to work," says this company. "It appears to us that the railway companies have been doing all that they could in the matter of spotting cars at the mines and the operators are willing to turn out the coal, but with the present high scale of wages paid to miners they will not work more than three or four days out of a week; and, too, they have a custom of declaring holidays every time something unusual occurs in their communities."

Another company, which is not far from one great coal-producing area where miners are agitating for an increase, writes: "Should the government enforce an additional increase of wages to labor in this particular coal field, it is the consensus of opinion of the coal operators that it will be an error. They point out that the higher the wages miners receive in this territory the less the tonnage per man that is obtained."

An important interest sees encouraging promise of

an increase of possibly 25 per cent in available coal production as a result of railroad co-ordination:

The corrective steps that must be taken are being taken rapidly. The coal production of the country can be increased substantially, possibly as much as 25 per cent, by a steady, regular supply of empty coal cars to the coal mines and quick transportation from the mines when the cars are loaded. This problem will be partially met by the unification of control of the railroads under Mr. McAdoo and further as additional equipment can be added.

In many coal fields there are not as many miners as there should be and an increased number of miners would naturally increase production, but not until the car supply has become equal to the possible output of the miners now at work. Of course equipment, both locomotives and cars, must be added just as rapidly as they can be supplied.

There are many ways of economizing in the use of coal—by the elimination of uneconomical plants, substituting central-station service where the consumption of coal may not be one-half so great for the same result; by the elimination of non-essential industries and consumers, and by general economy, particularly in the operation of the railroads as one system, where nine locomotives may be able to do the work previously done by ten or even more.

BELIEF IN EFFECT OF RAILWAY POOL

Similarly, another company expresses faith in the helpful influence of railroad operating unification: "We believe the pooling of railway equipment by the various lines under the national operating board will relieve the shortage of cars and transportation facilities to a very great extent. The maximum relief will be obtained when the operating details are fully worked out under this plan, which will take a little time."

It is the unanimous opinion that the outlook as to coal supply for the rest of the present winter is shrouded in uncertainty. Conditions are indicated by the following:

The coal situation, in order to take care of our business, is extremely acute, but the Fuel Administrator has ordered certain mines to supply us with coal, and by more or less frequent trips we are able to buy some spot and have managed to keep in pretty fair shape.

We don't consider the outlook for the winter of 1917 and 1918 as being very much brighter; in fact, it may be even worse before it is better.

At present the outlook for coal supply is not very sanguine. Our shipments of coal within the last ten days have been very unsatisfactory.

The outlook for the winter of 1917-18 is not very promising, and practically all companies in the State are experiencing trouble in getting their coal supply and are compelled to accept any kind of coal that is obtainable, regardless of the quality. I believe all of the coal furnished is being furnished at government prices. However, the question of securing the coal is the serious problem, and it is a very difficult matter to locate where the trouble lies. A part of it, of course, is due to shortage of cars and transportation troubles. However, there also seems to be a shortage of coal, and operators claim that the labor condition is to blame for this.

If we have a mild winter, the chances are we will get through all right; if we have a severe winter, tying up river and rail shipments, the chances are we will experience a shutdown of greater or less duration.

From one company the suggestion is received that

"the existing deficiency in coal in the consumers' premises is in a measure due to the fact that they have not realized that the demands for coal are greater than ever before and have not appreciated that in every cold snap the railroads do not have the ability to handle coal as in warm weather; that the retailers, particularly, have not put in a supply of coal during the months when transportation can be easily handled, on account of the lack of transportation during intense cold. In other words, I do not see why the retailer should not endeavor to get coal during months when the railroads can move the coal and urge the domestic users to put in a supply during the warm months. With a little foresight on the part of every one and a little less agitation by the press, I really feel the coal situation would be very much improved, particularly if the government would force the miners to work a reasonable number of hours a week."

A company which is convinced that, in its district at least, the railroads are not wholly responsible for the coal famine and sees definite hope of improvement, says:

The practice of conservation by the coal consumers and the substitution of other fuel where possible will greatly aid the government and relieve the pending shortage. With transportation facilities provided, coal production right at this time should be at its maximum. The transportation companies, however, are not entirely to blame for the coal shortage, as during the summer months, when coal is generally stored for winter use, the mines were working only two and three days out of the week, on account of shortage of coal-handling equipment. At this time the coal-handling equipment was being used for transporting lumber and other material for the construction of army cantonments. It is a condition that, by the consumers practicing the utmost economy and the replacement of coal by other fuel, will soon correct itself, even with the increased demand.

One source of confusion, admitted as such by both the Washington authorities and the great industries of the country, is the multiplicity of priority orders. Efforts to reduce these and thereby to make the priority orders more effective when they are issued are under serious consideration now. "In our opinion," writes one company to the ELECTRICAL WORLD, "the greatest corrective step that can be taken by the government is to control more systematically the enormous number of

priority orders which are being issued to the railroads, which are handicapping very seriously the efficient movement of cars."

The question of price is regarded by some companies as constituting the factor which most demands corrective action. Officers of two of these write:

I do not believe the government can reduce the prices without bringing on a serious condition, owing to the fact of such a low reserve. I do believe, however, that next summer the demand for coal will slacken and the price will fall below the present government fixed prices. It may be possible, after a year's operation at the government's prices, that the Federal Trade Commission will be able to determine from records that profits are unduly large, and a slight reduction may come.

What I fear for the future is this: A large number of contracts for coal at high prices will expire March 31, 1918. It is likely that the government will not permit renewals of contract except at its price. This price, in my judgement, is hardly high enough to promote average production, let alone increased production. If conditions get worse, I fear even priority orders will not in many cases result in sufficient coal deliveries. Better co-operation is needed between the government coal producers and railroads.

Other suggestions received by the ELECTRICAL WORLD the acceptance of which will help to restore normal conditions of coal supply and demand are as follows:

Greater care should be taken in the mining and shipping of coal to reduce the amount of ash, thereby reducing the amount of material that has to be transported on the railroads as well as transported through the streets of the city for the disposal of ashes by teams.

I would suggest that all power stations store as much coal as possible during the summer months; that the pooling arrangement for railroads be put into effect, and that all consignments of coal be unloaded immediately upon arrival at destination, so as to prevent the blocking of terminal yards by reason of their being used by coal companies as storage places. I believe another important factor would be to compel the use of central-station power by the small power users wherever it is available.

The greatest conservation of coal that could be made, in my judgment, is by the isolated or block plants taking central-station service. In the aggregate this would be a great saving in the country.

[A continuation of this article, to be published next week, will deal with other vital phases of the critical coal situation.]

UNDER ANTE WAR CONDITIONS COMPANIES KEPT LARGE RESERVE COAL SUPPLIES

Electrical Properties of Vulcanized Fiber

The Effect Exerted by Color, Thickness and Temperature on the Breakdown Value of This Material—Reasons for Performance
Noted—Specifications

BY WILLIAM EVES, 3D

Engineering Department American Vulcanized Fibre Company

CONSIDERABLE work has been done in the measurement of the electrical properties of vulcanized fiber, but not very much of the information that has been obtained on the subject has been collected. This is largely due to the fact that it is extremely difficult to compare values obtained by one experimenter with those obtained by another, because of the lack of standardization in testing methods.

The specific resistance, surface resistance, specific inductive capacity and breakdown voltage, often called dielectric strength, are about the only electrical properties concerning which information is ever required by the user, and of these the breakdown voltage is by far the most important, as it is one factor which is considered in 98 per cent of the cases. Consideration will be paid here to this property only because the data available on the other three properties are so meager that their publication would not be warranted.

BREAKDOWN VOLTAGE

The breakdown voltage per unit of thickness of vulcanized fiber is a function of the thickness itself, the

chloride is a very deliquescent substance. This may happen in spots, and likewise any foreign material that would tend to reduce the breakdown voltage would naturally occur in a few places and possibly not at all in some samples. At these points leakage would occur between the electrodes of the testing set; local heating would result, reducing the resistance of the small amount of solution, and breakdown would occur before the true breakdown voltage of the fiber was reached.

As has been pointed out before in connection with tests of dielectrics, the method and conditions of the test will also affect the voltage at which the sample will break down. The shape of the electrodes, whether needle points, round-edge or flat-edge disks, or spheres, will affect the distribution of the electrostatic flux throughout the material, and the medium in which the terminals are immersed, oil or air, and the rate of application and the method of application of the voltage will determine the amount of heating due to corona loss, causing consequent drying and carbonization and premature breakdown. For these reasons due care must be taken that no peculiar conditions exist to distort the

CHARTS A AND B—BREAKDOWN VOLTAGES OF THIN AND THICK SAMPLES OF GRAY VULCANIZED FIBER

extent to which the gelatinization of the individual plies of paper has been carried, the temperature of the sample at time of test, and the color to some degree. Conditions of the material that are likely to affect the breakdown voltage are the quantity of chemical remaining in the fiber after its manufacture (which whenever present is extremely small), the moisture content, the homogeneity and density of the sample, and the physical shape of the sample.

Moisture to a certain degree is necessary for the life of vulcanized fiber. Zinc chloride is used as the gelatinizing agent in the manufacture of the fiber, and any that remains after the washing processes will be in solution in the natural moisture, because zinc

conclusions made and that a sufficient number of samples are taken to secure good average results.

CURVES SHOWING EFFECT OF TEMPERATURE AND THICKNESS

The variations of breakdown voltage with temperature for vulcanized fiber of various thicknesses and colors are illustrated by the accompanying curves. They were plotted from test data obtained at the Massachusetts Institute of Technology by Katzenstein and Burt. Each point on a curve represents the average of eight or nine tests on the same sample. Samples from four well-known manufacturers of vulcanized fiber were used in the investigation, and the results of those of approx-

imately the same thickness and color are compared. In all 4000 tests were made. They were all made with the same electrodes, and the voltage was increased at the constant rate of 1000 volts per second. At temperatures higher than room temperature the samples were prepared by heating in an oven for one hour for the thinner specimens and from four to five hours for the thicker.

Chart A, referring to gray fiber, shows an increase

CHARTS C AND D—PROPERTIES OF BLACK AND THICK RED VULCANIZED FIBER

of approximately 80 per cent in breakdown voltage from 25 deg. C. to 100 deg. C., with a decrease in one case from 25 deg. C. to 50 deg. C. This dip in the curve probably would not occur in many samples of this thickness and cannot be explained without more knowledge of the chemical properties of the particular sample.

The results for thicker gray fiber, given in chart B, show an average decrease in the 25 deg. to 100 deg. temperature range of 77 per cent. Tests on pieces thicker than $\frac{1}{2}$ in. (1.27 cm.) are not very interesting, because the voltage required to break down a sample of such thickness is greater than most commercial voltages.

A comparison of results on black fiber is given in chart C. Here again one sample shows a decrease at 50 deg. and a considerable increase at 100 deg. It is interesting to notice that the breakdown voltage of one of the other two samples slightly increases with the temperature, while the other slightly decreases. The average increase is 12 per cent. It is at the thickness of these samples that the turning point occurs.

CHARTS E AND F—BREAKDOWN STRENGTH OF THIN RED VULCANIZED FIBER AND AVERAGE VALUES FOR ALL COLORS

Greater thicknesses show a decrease in breakdown voltage with increase in temperature.

Chart D gives the results of tests with red fiber and is quite typical with the exception of one point at 50 deg. Here the average decrease in breakdown voltage in the range from 25 deg. to 100 deg. is 60 per cent.

According to chart E, relating to thinner red fiber

voltage from 25 deg. to 100 deg. is approximately 20 per cent, although the increase from 25 deg. to 50 deg. is slightly greater. This shows that the conditions tending to increase the breakdown voltage and those tending to decrease it about neutralize each other in the range from 50 deg. to 100 deg.

The most plausible theory for the change from an increasing variable with temperature to a decreasing variable, as the thickness increases, is that two condi-

tions in the sample tend to offset each other. As stated before, fiber contains moisture to a certain extent and zinc chloride to an extremely small degree in solution. It is well known that the resistivity of solutions decreases with increase in temperature. On the other hand, fiber loses a certain amount of its contained moisture when it is heated, and the greater thicknesses do so much less rapidly than the lesser thicknesses, but not at all in proportion to the thickness. The thicker samples used in these tests were heated four or five times as long as the thin samples, but the thin samples would lose a far greater percentage of moisture in one hour than the thicker ones would lose in four or five hours. Hence in the case of the thinner samples the moisture content was probably less when tested at higher temperatures, the strength of the small amount of solution in the sample was greater and the resistivity greater. This was probably the controlling condition in the thinner samples, causing the breakdown voltage to be greater at higher temperature, while the temperature of the solution controlled the breakdown voltage at higher temperatures in the thicker samples.

The results of these and many other tests made with the fiber of five large manufacturers have been averaged, and the composite results are shown in chart F. This curve gives values for room temperature only. The tests were made under all conditions and with all grades of fiber.

Gray fiber is made from paper of the natural color,

small amount of lampblack or other coloring matter, and red is colored with a relatively large amount of various grades of oxide of iron. For this reason it would be expected that the colored fiber, and particularly red, would have a lower breakdown voltage than gray fiber. Although this is true in some cases, it is not always so. Here again other conditions affect the results.

Any loading material placed in the paper from which vulcanized fiber is made tends to interfere to some extent with the chemical treatment, and the result is a less homogeneous material. Coloring matter acts as a loading material and produces a slightly more "papery" fiber, which usually has a higher breakdown value because of the greater degree of lamination. Moreover, fiber is made from three grades of paper, which vary in the degree to which they are gelatinized by the chemical action. The paper from which $\frac{1}{8}$ -in. to $\frac{3}{4}$ -in. (3.175-mm. to 19.05-mm.) fiber is made is treated to the greatest extent by the zinc chloride, and consequently a more homogeneous material, with low breakdown voltage, results. In a large number of cases the loading factor of red fiber is so much more pronounced than the tendency for the small amount of solution of oxide of iron to lower the breakdown voltage that the dielectric strength of red fiber will be higher than that of gray fiber. However, in other cases the reverse conditions exist, but the difference is so small as to be commercially negligible. Black fiber is usually between the red and gray grades and nearer the gray in its breakdown voltage.

OTHER PHYSICAL AND CHEMICAL PROPERTIES

As vulcanized fiber loses its normal amount of contained moisture its pliability decreases and finally it becomes brittle. This is caused either by application of a sustained temperature of 80 deg. to 100 deg. C. (176 deg. to 212 deg. Fahr.) or to higher temperatures up to 200 deg. C. (392 deg. Fahr.) for shorter periods of time. At this latter temperature charring commences. It has the following strengths in pounds per square inch: Tensile, 9000-13,000; compressive, 33,000-43,000; shearing, 9000-13,000.

Vulcanized fiber is not waterproof. It absorbs water to a certain degree, but is not injured by either hot or cold water, for it returns to its original dimensions and properties when dried. Most dilute acids and alkalis cause no other effect than the effect of water, but concentrated acids cause disintegration. However, organic solvents and all oils have absolutely no effect and are not absorbed in the slightest degree.

GENERAL USES FOR ELECTRICAL INSULATION

Although vulcanized fiber was first used in 1873 for axle washers and railway-car-journal dust guards, it has been more widely known in late years as an electrical insulator. It was early used in large quantities for magnet bobbins, coil insulation, cleats, armature wedges, insulating blocks, gears and handles, etc. Since the development of the automobile industry another large electrical insulation field has been opened. It is of service for insulated staples and cleats, straight and bent wire conduits, flanged bushings for use wherever a wire passes through body or frame, timer rings and other insulating rings, insulating washers, switch bars and bases, switch panelboards, fuse tubes, and in gen-

eral where good machining and bending qualities are a necessity.

One of the largest uses of vulcanized fiber at the present time, either for electrical or mechanical purposes, is for railway signal insulation. The specifications for this application are quite severe. This is an instance where the material is subject to severe weather conditions and extreme mechanical strain, and yet the dielectric strength must be high even when it contains a fairly high percentage of moisture.

The Railway Signal Association's specifications require a specific gravity of 1.3 to 1.5; an absorption when immersed in water at 70 deg. Fahr. for twenty-four hours, not to exceed 45 per cent by weight for $\frac{1}{8}$ -in. (3.175 mm.) fiber, 30 per cent for $\frac{3}{16}$ -in. (4.76-mm.) fiber, and 26 per cent for $\frac{1}{4}$ -in. (6.35-mm.) fiber; a tensile strength of 5000 lb. per sq. in. (351.5 kg. per sq.

BREAKDOWN VOLTAGES* OF SEVERAL THICKNESSES OF VULCANIZED FIBER

Thickness (In.)	Breakdown Value (Volts per Thousandth Inch)
$\frac{1}{8}$	225 to 425
$\frac{1}{16}$	150 to 300
$\frac{1}{32}$	125 to 275
$\frac{1}{64}$	100 to 225
$\frac{1}{128}$	75 to 150

*Results higher than these have frequently been observed, but these limits will include the majority of cases.

cm.), and a dielectric strength of 32 volts per 0.001 in. (0.025 mm.) for all thicknesses, under the application of voltage for one minute between disk electrodes 1 in. (2.54 cm.) in diameter. The specifications require further that the fiber shall withstand bending into a circle of a radius ten times the thickness without cracking or splitting.

The absorption and specific gravity are very important, first because of the service conditions, and second because the higher the specific gravity the more homogeneous the material is and the more easily is it fabricated, punched, bent and worked into shape. Moreover, fiber with high specific gravity will have a higher tensile strength and will resist shear to a greater degree under all conditions.

To fulfill these requirements the manufacturer must pay particular attention to the stock from which he makes the paper and to the conditions under which the fiber is run up. Tests must be made on each lot in order to make sure that no conditions have entered the manufacture which might harm the properties which are so important. It can be safely said that more care must be taken with fiber made for this purpose than for any other, because, as stated before, the more homogeneous vulcanized fiber is the lower the breakdown voltage is likely to be.

CONCLUSION

When the breakdown voltage per thousandth of an inch, the specific gravity and the cost per pound of vulcanized fiber are compared with the corresponding values for other insulating materials, it will be found that the commercial insulation value of vulcanized fiber is very high. In fact, it can be used in many cases where no other material will answer, when its ability to be machined with great accuracy and to be bent, punched and formed to shape is taken into account.

Joliet Plant a Step Toward Higher Steam Pressures

Second Installment of Article Deals in Detail with Method of Handling Coal and Supplying Feed Water, Features of Turbine, Condenser and Circulating-Water Arrangements

GENERAL features of the new high-pressure plant of the Public Service Company of Northern Illinois at Joliet, Ill., were outlined in the Jan. 19 issue of the *ELECTRICAL WORLD*, and interesting details were given regarding the boiler and economizer construction employed. This issue will dwell on the remaining mechanical equipment.

THE FEED-WATER SYSTEM

Feed water for the boilers is mainly condensate which has been delivered through a pre-heater at the top of the condenser containing 1000 sq. ft. (92.9 sq. m.) of surface to the heater by either one of duplicate motor-driven condensate pumps. The heater is of the open type, having capacity to serve the two boilers of the unit. Either of two four-stage turbine-driven centrifugal pumps designed to deliver 300 gal. (1135 l.) per minute against a head of 375 lb. to 400 lb. (26.4 to 28.1 kg.) feeds the water to the boilers. The turbines are rated at 126 hp. and operate under full boiler pressure, their output being controlled by pressure-regulating valves. The water passes through the economizer and enters the boiler at both ends of the cross-drum.

The make-up water comes from a fresh-water reservoir which collects the drips, heater overflow and other available condensed steam. Under float control it is also supplied with filtered service water. The house-service water supply is drawn from the condenser-intake tunnel by two 600-gal. (2271-l.) pumps, one driven by a turbine and the other by a motor. It is delivered to a service tank on the roof. From the pump discharge line several taps are taken off for transformer cooling and for various services where

raw water can be used. Return water from the tank passes through duplicate pressure filters which are cross-connected and used alternately. Each has capacity to filter 150 gal. (567.8 l.) per minute. Upon leaving the filter the water supply divides, part going to cool bearings and to the lavatory system and the rest as needed to the hot-water reservoir. The vacuum on the main unit is utilized to draw the water from the reservoir into the condenser, the amount being regulated by a float in the heater. It is removed by the condensate pump in the usual way and delivered to the heater.

With the exhaust steam available the water temperature in the heater under average load conditions will range from 100 deg. to 120 deg. Fahr. To maintain the temperature within this range, a bleeder connection under thermostatic control has been made to the fourth stage of the turbine.

COAL-HANDLING SYSTEM

Coal for the plant, Illinois lump and screenings, is brought in over the company's siding from the Chicago & Alton tracks at Plaines, about $\frac{3}{4}$ mile (1.2 km.) distant. The company has its own locomotive and coal cars and a yard at the plant containing five tracks. No. 1 is a storage track running past the south side of the building, Nos. 2 and 4 are ash tracks serving the two rows of boilers, No. 3 is the coal track and No. 5 serves the turbine room. Between these tracks there is space to store about 10,000 tons (9,070 t.) of coal inside the power house. Track No. 3, centering on the firing aisle, leads into the boiler-room basement over a concrete pit capable of storing 800 tons (635.6 t.) of coal. By a four-motor traveling crane with a 2-yd.

FIGS. 1 AND 2—MOVABLE CRUSHER OVER CONVEYOR THAT DELIVERS COAL TO OVERHEAD BUNKERS, AND PORTION OF THE CONVEYOR CHARGING BUNKERS IN PROCESS OF DUMPING COAL

(1.8-m.) grab bucket the coal is unloaded into a four-roll traveling crusher driven by a 50-hp. induction motor which discharges to a bucket conveyor delivering into the overhead bunker. The latter has capacity to hold 450 tons (408 t.) or 112 tons (101 t.) per boiler. The bunker is made up of steel plates, concrete-lined, and is divided up into compartments with double chutes

FIG. 3—SPECIAL HIGH-PRESSURE-WELDED JOINT FOR STEAM LINE

from each leading to the two stokers under their respective boiler.

Screenings are handled in the same way, with the exception that the rolls of the crusher are spread to allow the coal to pass through to the conveyor. On both sides of the crusher are by-pass chutes to the storage pit. The coal may be unloaded into the pit or onto the outdoor storage space. In the latter case a locomotive crane unloads the coal and loads it again when it is desired to remove it to the plant.

Under each boiler furnace are ash and fine coal hoppers. The former is lined with firebrick and is equipped with a sprinkling system to wet down the ashes. Through a manually operated sliding gate the ashes are passed directly to railway cars. Thus ash-handling apparatus is eliminated. Farther forward is the fine

by special Y-fittings at the boiler-room wall. A 10-in. (25.4-cm.) pipe supplies the turbine.

THE TURBINE AND CONDENSER INSTALLATION

The main generating units of the present installation are rated at 10,000 kw. at 80 per cent power factor. At the turbine the working pressure is 300-lb. (21.1-kg.)

gage. Over all the turbo-generator is 33.5 ft. (10.2 m.) long, 13.25 ft. (4.04 m.) wide and 12 ft. (3.7 m.) high, thus requiring a floor space of 0.0444 sq. ft. (0.0041 sq. m.) per kilowatt of rating. The turbine is served by a two-pass condenser containing 20,000 sq. ft. (1852 sq. m.) of surface.

Circulating water is supplied by a centrifugal pump having a capacity of 18,000 (68,136 l.) gal. per minute. In conjunction with a Le Blanc air pump, the circulating pump is driven by a 200-hp. slip-ring induction motor. Each condenser pump is rated at 360 gal. (1362 l.) of condensate per minute and is driven by a 25-hp. motor.

Cooling water for the condensers is drawn from the Desplaines River through a concrete tunnel and enters a forebay, where it first encounters an iron grid designed to keep back driftwood which may have escaped the log boom at the intake, and then passes through revolving screens. Each screen is driven by a 5 hp. in-

FIG. 5—TRAVELING SCREENS WHICH KEEP CONDENSING WATER FREE OF DÉBRIS

duction motor through reduction gearing. Provision is made for swinging the screens in to a horizontal position for inspection or repairs. Water from slotted pipes is forced through the screens at high velocity to clean them, the debris draining into a trough leading to the discharge tunnel.

Back of the traveling screens are double sets of sectional stationary screens having $\frac{1}{2}$ -in. (1.3-cm.) mesh to catch fibrous material, small fish or debris of any character remaining in the water. For cleaning they are removed by a hand-operated beam trolley. The discharge tunnel extends along the top of the injection tunnel as far as the river side of the railway. Here it turns downstream and discharges into a swampy tract bordering on the river. From the turn in the main discharge tunnel an extension leads to the intake, so that warm water may be discharged there to reduce ice formation during the winter season. A sluiceway valve regulates the amount of water drawn off for this purpose.

The electrical features of this plant will be described in a later issue of the *ELECTRICAL WORLD*.

CHOOSING LIGHTING UNITS FOR INDUSTRIAL PLANTS

Scientific Illumination More Important Than Ever—
Classification of the Principal Requirements
for Lamps and Reflectors

BY DAVIS H. TUCK

Electrical Engineer Holophane Glass Company

EVEN in times of normal activities manufacturers have found that scientific illumination increased the efficiency of their plants by making possible (1) greater output, (2) better workmanship, (3) less spoilage, (4) fewer accidents, (5) less sickness, (6) reduced labor turnover, and (7) reduced overhead by twenty-four-hour utilization of equipment. These benefits are of greater importance than ever before because every manufacturer is confronted with increased costs of materials, shortage of labor, and the problem of increasing production without reducing the quality.

While expert advice is necessary to secure the best illumination, owing to the different requirements in different places, observing the following suggestions will bring better results than not having consulting advice at all.

THE LAMP

Efficiency.—The lamp should give the maximum number of lumens (light flux) per watt.

Life.—The life of a lamp is its economic life and not the period which elapses from the time it enters service until it fails. The efficiency (lumens per watt) of a lamp falls off with use until finally a point is reached where the lamp has become so inefficient that it is advisable to throw it away and buy a new lamp. The best lamp is, therefore, the cheapest lamp which will burn the longest time with the least fall in efficiency (lumens per watt).

Color of Light.—The light should have a color suitable for the work to be performed.

THE REFLECTOR

Efficiency.—The ratio of total lumens from the combined lamp and reflector to the total lumens from the lamp alone should be high.

Distribution of Light.—It is principally the light in the 0-deg. to 65-deg. zone that is of use, therefore the light shown by the distribution curve of the reflector should fall as closely within these limits as possible. The greater the candlepower of the light in the 65-90 deg. zone the greater the glare, and the nearer the high candle-power is to the 90-deg. zone the more objectionable it is. Some light, to light upper portions of the room, should be contained in the 90 deg. to 180-deg. zone, as it causes a strain on the eyes to have too great a contrast between the lighting unit and its surroundings.

Shield Light Source.—The light-producing surface of the lamp should be shielded from the eye, as modern light sources are too intense for the eye to view with safety. Furthermore, the brightness of the lower surface of the reflector should be low.

Maintenance.—The reflector should be durable and the reflecting surface should not deteriorate with age, heat of the lamp or fumes of the shop. It should withstand frequent washing and after washing should present a surface equal to the surface which existed initially.

Fan, Blower and Air-Compressor Applications

Operating Characteristics of Different Types of Apparatus for This Service— Motors and Control Equipment Best Adapted Thereto and Methods of Connecting

BY C. E. CLEWELL

Assistant Professor of Electrical Engineering, University of Pennsylvania

This article takes up the application of the motor to a line of apparatus where the horsepower requirements vary in general as some function of the speed other than the first power. Characteristics relating to the power requirements of fans, blowers and air compressors are outlined, and attention is called to the types of motors and control apparatus which are usually employed for driving this line of machinery. The mechanical connection of the motor and the machinery to be driven is treated both from the viewpoint of the efficiency of the system as a unit and from that of such incidental items as the avoidance of noise, which is relatively important in some applications. Specific types of fans, blowers and air compressors are discussed somewhat in detail.

OF THE different types of apparatus available for impelling air or delivering it under pressure, the rotary blower is used principally for those cases where the air passages to and from the fans are unobstructed, as in some cases of ventilating, cooling and exhaust service. Blowers like those illustrated in Figs. 3 and 4, although not of the positive types, are adapted, because of their ability to develop some pressure, to those cases where a continuous supply of air is required for ventilating, blowing, drying or other purposes and in which there is some resistance to the flow of air which makes necessary the pressure produced by this type.

For many cases where large volume and relatively high air pressure is required, as in the blowers for oil and gas furnace work, in the burning of pulverized coal, for the blasts used with foundry cupolas, in ash and coal conveying, for the transmission of cash and mail pneumatically, for blast-furnace work and the like, air compressors are used. The centrifugal air compressor is a type which is widely used for the above purposes.

OPERATING CHARACTERISTICS

The variations of the horsepower and efficiency of fans and blowers with speed, dimensions of the outlet and density of the gas handled are important items in the operation of such devices. For a given area of the discharge opening the horsepower required to drive a fan or a blower depends on the cube of the speed. Hence it will be noted that at starting the torque required is negligible as far as the load is concerned, being due only to the mechanical friction and the inertia of the comparatively light revolving parts. As the fan or blower speeds up the horsepower rapidly increases according to this variation as the cube of the speed. Starting requirements are thus of little or no importance in such apparatus.

For a given area of the discharge opening and with constant speed the horsepower required by a fan or blower varies directly as the density of the gas handled. It is interesting to note that the efficiency of fans or blowers is unchanged by variations in speed, and in this respect they differ considerably from other machinery.

The efficiency does vary, however, with changes in the opening of the discharge area.

Leonard¹ gives the following information concerning the variation in the horsepower for fans and blowers for given driving speeds and with a decrease in the size of the discharge area. For a centrifugal fan the horsepower decreases with a decrease in the area of the discharge orifice. With a propeller fan, however, the horsepower increases as the area of the discharge orifice decreases. Thus in some designs the horsepower for a propeller fan with its rated orifice is one-quarter or less of the horsepower with a complete discharge restriction. In the case of positive blowers, owing to the very small clearances between the rotating element and the casing, the horsepower increases rapidly with decreasing values of the discharge orifice area.

TYPES OF MOTORS USED

The smaller types of fans and blowers, like those represented by Figs. 2, 3 and 4, are available with either direct-current or alternating-current motors and can

FIG. 1—LARGE EXHAUST FANS DRIVEN BY HIGH-SPEED MOTOR

be operated from any ordinary electric light circuit without a starting rheostat. For fans of the kind shown in Figs. 2 and 3 single-phase alternating-current motors are employed, and when operated on direct-current supply circuits motors of the series-wound

¹See classification by M. S. Leonard, in "Standard Handbook for Electrical Engineers," fourth edition, page 1237. Frequent references have been made in the preparation of this article to this section by Mr. Leonard on "Fans and Blowers," and also to the section on air compressors by J. H. Brown, Jr., page 1235 of the "Standard Handbook," and to information and illustrations placed at the disposal of the writer by the General Electric Company, the Westinghouse Electric & Manufacturing Company, the Crocker-Wheeler Company and the Wagner Electric Manufacturing Company.

type are used. For the blowers shown in Fig. 4 single phase alternating-current motors or shunt-wound direct-current motors are used.

A more comprehensive statement concerning the

This added flywheel effect tends to maintain the operation of the motor in case of an unusual momentary drop in the supply voltage. For the smaller compressors induction motors are usually employed because of the

FIGS. 2, 3 AND 4—SMALL FANS THE MOTORS OF WHICH DO NOT REQUIRE STARTING BOXES, AND A BLOWER ADAPTED TO CONDITIONS WHERE THERE IS SOME RESISTANCE TO THE FLOW OF THE AIR

types of motors to use for fans and blowers in general is as follows: With an alternating-current supply all types may be driven by induction motors. With a direct-current supply shunt-wound motors are best for centrifugal fans; for propeller fans either the shunt or the series motor may be used, although the latter is preferable. For positive blowers the shunt motor is recommended.

Fans of the type shown in Fig. 1 are made in a wide variety of sizes, and the speed of driving decreases with the increasing dimensions of the fan. Some idea of the speeds in r.p.m. of these fans for a number of different fan diameters together with the volume of air moved per minute may be gained from the accompanying table, which covers equipment for 115, 230 and 500-volt service.

Centrifugal air compressors of the single-stage type are driven from alternating-current supply circuits by squirrel-cage induction motors, in which case the motor is of course of the constant-speed type and the driving speed cannot be adjusted. It is necessary, therefore, in the application of such motors to specify a pressure high enough to take care of the range of the operating requirements. Where the supply is direct-current, shunt-wound motors are used, with commutating poles and a so-called shrunk-ring commutator for providing sparkless commutation.

For displacement air compressors self-starting synchronous motors or induction motors may be used, although the former type is recommended for direct-connected sets in the larger sizes. Among the advantages of the synchronous motor as now used for compressors of this type are their self-starting as well as self-synchronizing characteristics, continuous operation even with low line voltage or other power disturbances, high efficiency, absolutely uniform speed and high power factor.

Since the rotating element of a standard synchronous motor does not usually in itself possess sufficient flywheel effect to prevent undue fluctuations in the current with successive strokes of the compressor, it is desirable to use a flywheel on the compressor shaft.

lower cost for this type in the smaller sizes compared with that of the synchronous motor.

METHODS OF CONTROL

As pointed out above, the very small sizes of fans and blowers do not require starting rheostats, being merely connected to the line by an ordinary snap switch. In general, however, any direct-current motor-driven fan or blower which is to be operated at one speed only irrespective of the service conditions requires at least a starting rheostat with a no-voltage release, and in

FIG. 5—THREE-PHASE INDUCTION MOTOR DIRECT-CONNECTED TO TWO EXHAUST FANS

case there is a likelihood of an extraordinary increase in horsepower an overload release will also be found essential.

Where speed adjustment is required two conditions may arise: (a) The motor operates for the most part at normal speed with occasional times when reduced speed is necessary, or (b) the motor operates for most

of the time at speeds below normal and is occasionally brought up to speed at or near normal. In case (a) armature resistance control may be used, while in case (b) field control is more economical. Values for the speed ranges usually met with in practice are for a decrease of, say, 50 per cent below normal for armature resistance control and for about 10 to 25 per cent in-

at 3700 r.p.m. Hence it is possible to operate the direct current motor-driven set at as much as 20 per cent overload for a period not to exceed two hours.²

METHODS OF CONNECTING THE MOTOR

Of the two methods of connection, by belt and by direct connection, the former is recommended where the elimination of noise is essential, as in auditoriums,

DATA ON FAN DIAMETERS AND PERFORMANCE

Diameter of Fan (In.)	R.P.M.	Cubic Feet of Air per Minute
18	900	2,700
24	700	5,000
30	600	8,400
36	500	12,000
42	410	15,400
48	400	23,000

schools, hospitals and the like. Lower first cost of high-speed motors is also an advantage in this connection. Since the desirable speed for fans is not likely to agree with the rated speed of an alternating-current motor, belt connection is often essential with motors of this type.

Where direct connection is employed various standard methods of mechanically mounting the motor and making the connection to the fan are used. In larger sizes of compressors direct connection is always desirable, and the more so because of the ability to design the larger compressors for low speed.

SPECIFIC TYPES

Fans of the type pictured in Figs. 2 and 3 are designed to draw the air directly from a room, for example, and

FIG. 6—LARGE MOTOR-DRIVEN VENTILATING FAN

crease in speed above the ordinary average operating speed by field rheostat control.

With alternating-current motor drive for fans and blowers the motor is usually equipped with a starter only, and necessary changes in the volume or pressure of the air or gas are produced by throttling rather than by changes in speed.

With centrifugal compressors the practice of one representative manufacturer is to furnish a standard starting compensator with a self-contained oil switch, low-voltage release and overload relays for all compressor motors of the induction type of 5 hp. and above. For induction motors of 5 hp. and lower an oil switch with overload relays is furnished. For the control of direct-current motor-driven compressors each motor is furnished with a suitable field rheostat so as to make possible adjustments in air pressure by changing the speed of driving. Motors of 50 hp. and less are furnished also with standard starters, and with the larger sizes standard panels are used. The panels are equipped with field and armature resistance and switches both for starting and for controlling the speed of the motor.

Centrifugal compressors, when driven by induction motors, are operated at constant speed, and from the control standpoint the pressure rise of the compressor cannot be regulated by speed changes. On the other hand, it is always possible to throttle the pressure, with, however, no change in the volume capacity of the compressor. In contrast, the direct-current motor-driven compressors are adapted to some slight speed variations which produce corresponding pressure changes. As an example, a centrifugal compressor rated at 4500 cu. ft. (126 cu. m.) of air per minute at a pressure of 1 lb. (70.3 gm. per sq. cm.) and speed of 3450 r.p.m. produces a pressure of about 0.87 lb. (61.2 gm. per sq. cm.) and 4200 cu. ft. (117.6 cu. m.) of air per minute at a speed of 3200 r.p.m., and about 1.15 lb. (81 gm. per sq. cm.) pressure and 4200 cu. ft. (117.6 cu. m.) per minute

FIG. 7—LARGE BLOWER DRIVEN BY THREE-PHASE, SQUIRREL-CAGE MOTOR

to exhaust it into the open, and also for cases where the inlet and outlet pipes are sufficiently large and short so that there is little or no resistance to the passage of the air. The disk at the center prevents back flow and the

²Data based on Bulletin No. 48,609 (1917) of the General Electric Company.

turned-in ends of the blades give the fan a higher efficiency than older types. This type is made in sizes ranging from a wheel diameter of $18\frac{3}{4}$ in. to 32 in. (45.72 cm. to 81.28 cm.), with capacities ranging from 1860 cu. ft. to 6530 cu. ft. (52.0 cu. m. to 182.8 cu. m.) per minute.

The type of blower shown in Fig. 3, while capable of supplying air for ventilating and other purposes where there is some resistance to the passage of the air, is not a positive blower in the strict meaning of that term. This type is made in sizes ranging from a wheel diameter of $4\frac{1}{2}$ in. to 9 in. (11.4 cm. to 22.8 cm.), with capacities ranging from 175 cu. ft. to 700 cu. ft. (4.9 cu. m. to 19.6 cu. m.) per minute. Both types of fans just mentioned can be driven by small motors ranging from $1/20$ hp. to $1/8$ hp.

Centrifugal air compressors are used for a wide variety of applications and possess advantages over the displacement compressor in some cases. For example, in the pneumatic handling of cash in department stores, when the suction lines are opened to insert a cash car-

rier, the centrifugal compressor responds quickly by drawing in a large volume of air sufficient to pull the carrier along by the high air velocity thus produced. A positive pressure blower is more sluggish and in the ordinary sizes which would be employed for a given system would not respond to such quick changes.

Where direct-current motors are used for such compressors as pointed out above, increased speed produced by the adjustments which are possible with these motors creates increased pressure. However, since the volume of the air or gas which can be handled is limited by the rating of the driving motor, the volume must be reduced in proportion to the increase in pressure so as not to exceed the capacity of the motor used.

The foregoing notes point to some of the practical phases in the operation of these lines of equipment. The necessity for care in the selection of the motor for each individual case, particularly in the blowers and compressors of the larger sizes, is apparent from the numerous items which demand attention in the operation of such appliances.

Successful Operation of Secondary Networks

A Discussion of Various Important Points, the Neglect of Which Has Resulted in Many Failures in Attempts That Have Been Made to Operate Inter-connected Secondary Networks

BY S. BINGHAM HOOD

Superintendent of Distribution, Northern States Power Company

THE well-known reliability and flexibility of direct-current networks has resulted in many attempts being made to operate alternating-current networks along similar lines. These attempts have met with all degrees of success and failure, depending largely upon the amount of care and forethought that have been put into the design and construction of the network. In the vast majority of cases failures in continuity of service can be traced back to an absolute disregard of the underlying principles involved.

A secondary network is very similar to the direct-current system as regards the distribution of currents under both normal and abnormal conditions; consequently the basic principles governing the distribution of currents in parallel circuits can be applied to each. In the alternating network, fed by many step-down transformers of moderate rating, each transformer becomes the equivalent of a direct-current feeder. The primary network can then be considered as the equivalent of the direct-current substation bus. Having these comparisons clearly fixed in mind, the problem is at once greatly simplified.

THE FUSING PROBLEM

Each individual transformer unit feeding the network may be compared to a very short feeder having low resistance and must be protected on both the primary and secondary sides by fuses which will open in case of abnormal demands for current, or for faults within the transformer windings which would result in drawing exceedingly heavy currents from both the primary and secondary networks. For the primary side there are numerous makes of fuses that can be de-

pended upon to operate successfully under all conditions likely to be met in practical operation.

For the secondary side the problem is complicated by a lack of suitable fuse holders and fuses that are moderate in first cost and reliable when exposed to the weather for long periods of time. Since these fuses are so located that the fire hazard to nearby apparatus is very slight, it is not necessary or desirable to attempt to use any of the standard types of inclosed fuses whose cost and complications are those involved almost entirely by the necessity of furnishing protection from fire when the fusible element is ruptured. For this reason fuses for protection of the secondary of distribution pole transformers may be made of exposed non-corrodable metal links mounted in simple exposed metal clips and terminals. A type of fuse and holder which has proved successful for such use was described in detail in the Aug. 25, 1917, issue of the ELECTRICAL WORLD (Vol. 70, No. 8). The neutral wire of the secondary system must in all cases be permanently and effectively grounded and must be continuous without fuses throughout its length, including the neutral lead of the transformer secondary winding.

In fusing distributing transformers it is absolutely necessary to have both the primary and the secondary fused heavily, particularly when they are operated in parallel on a network. Fuses rated at from two and one-half to three times full-load current are none too heavy. Objection to such overfusing is generally based on the resulting danger of burning out the transformers from overloading. The maximum load on any transformer should be determined by a system of periodic tests and a record of loads connected in the period be-

tween tests. On any network there are numerous momentary demands for current which will result in unnecessary interruptions to the service if an attempt is made to limit the loading by means of fuses rated close to the normal capacity of the transformers feeding the load.

DESIGNING THE SECONDARY SECTIONS

In any interconnected network there is a definite section supplied by each individual transformer. Each of these sections should be so designed that the transformer is at the approximate center of the load on the section, being preferably so located that the current is distributed in a number of directions. This can be accomplished by locating transformers at junction points of the secondary mains. Generally speaking, however, it is not desirable to place transformers on junction poles owing to the already complicated wiring on such poles. It is, therefore, necessary to select a location as near as practicable to such junctions.

Having a group of such properly designed secondary sections, it is then only necessary to interconnect between them to form a network for parallel operation. In many systems the design has been carried out properly to this point, but has failed from other causes, as outlined below.

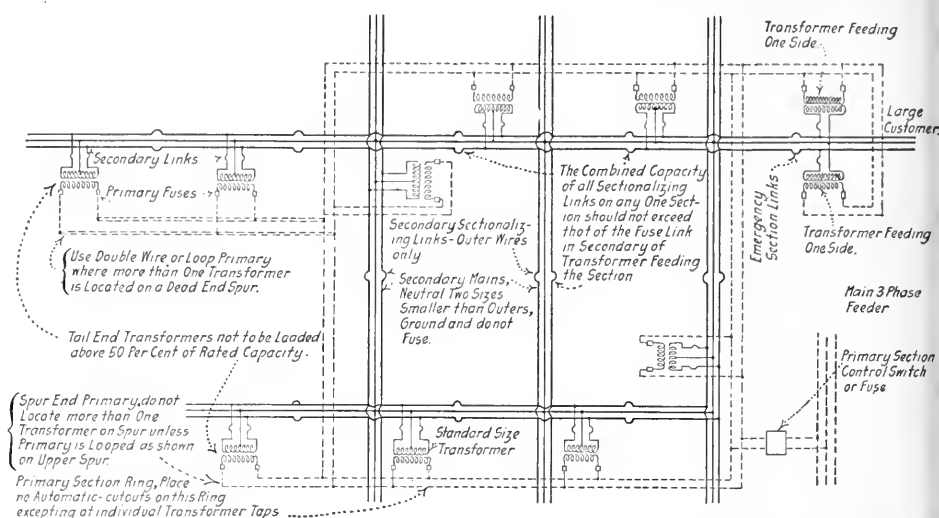

In the event of failure of any transformer on the network its load must be immediately taken up by adjacent transformers if continuity of service is to be maintained. As a transformer will safely carry a 50 per cent overload for a short time, it therefore follows that the minimum number of transformers operated in parallel is fixed at three. It also follows that the more transformers there are connected in parallel the smaller proportionate overload each will bear when any one unit fails. It also follows that all units feeding into any interconnected network must be of the same rating, otherwise a failure of any larger unit will disproportionately overload the smaller one adjacent thereto. This lack of uniformity in transformer sizes has been responsible for a large proportion of the failures.

Where a standard-size unit is used the transformer stock becomes simplified, and increases in load can be taken care of on the network at small cost by simply installing additional transformer units between those already existing, moving, where necessary, the adjacent units further apart.

In selecting the unit transformer for any district due regard should be given to the probable future development of the section to be served. In a district which is growing rapidly, as in many of the newer residential sections, a fairly large unit should be used, probably from 15 kva. to 25 kva. rating. This involves running moderately heavy secondary mains over considerable distances in order that the initial units

may be economically loaded. This practice is, however, the most economical in the long run, as it permits taking on additional load as the district develops, by adding transformer units at intermediate points on the existing mains. This practice is particularly desirable where an electric cooking load is increasing. If the old practice is followed of installing small secondary mains and small transformer units, the cost of continually increasing their size as new load comes on will mean a heavy ultimate expenditure and rapid depreciation on the original investment.

To secure the best results in network operation the secondary mains should be connected in a series of rings, each ring surrounding one or more blocks of the district served. With this layout there is no point at which the failure of one transformer will overload adjacent units more than the maximum allowance of 50 per cent. A further advantage is that of continuity of service, even if the secondary main should break at

A TYPICAL SECONDARY NETWORK DETAILING THE VARIOUS POINTS BROUGHT OUT

A study of this sketch will show clearly the reasons for the points taken and will show why their non-observance will result in frequent failures.

any point. In practice, however, there will generally be a tail-end section on the network, the failure of the transformer feeding which would result in placing a 100 per cent overload on the next unit. In order to avoid this condition, which in a long single-main secondary would result in a general blowout, it is imperative that the end transformer feeding any tail-end section must never be normally loaded more than 50 per cent of its rating. As this is not a very economical operation, it follows that these tail ends should be avoided wherever practicable. This can usually be accomplished by running an extra heavy secondary main from the nearest point on the network at which the interconnected ring system can be tapped.

RING-TYPE PRIMARY SYSTEM ADVISABLE

For the purpose of feeding the various transformers of the interconnected network the primary system requires special consideration. Having a backbone primary feeder with numerous tapped mains taken off to feed the various transformers, as is the practice with non-interconnected transformers, will not give safe operation on an interconnected network. The reason for this is that a break at any point on the primary system within the network area will result in those

transformers on the supply side of the break feeding the rest of the load beyond the break through the intermediate secondary-network section. The natural and inevitable result of this will be a general and wholesale blowout of the entire network. In order to overcome the possibility of such an occurrence, the primary system must be connected in a series of one or more closed rings. At no point must more than one transformer unit be located on a single spur taken off this primary ring. Such a ring system has many other marked advantages, such as equalization of voltage, minimum amount of copper for diversified loads, ability to cut out sections for repairs without interrupting service, etc. The primary ring-connected section should be independent from the general primary feeder and connected solidly, without automatic cut-outs, throughout the section served. This individual primary section should then be controlled by an individual switch or cut-out installed where the section taps off the main feeder.

Where the source of supply is a three-phase system it is good practice to divide the district served into three distinct sections, feeding each from one of the three phases of the feeder. This involves, in large systems interconnecting in each section, probably from 300 kw. to 500 kw. in local transformer rating. To those who have met with difficulty in parallel operation this may appear to be an abnormally large section on which to locate trouble, particularly if a total interruption occurs. With a properly designed network, however, such widespread interruptions will be so rare that the probability of such an occurrence can be neglected. In one large city where this sort of parallel operation has been operated for a number of years there has not been a single network interruption since the inception of the system. Moreover, the failure of individual transformers from lightning and other causes has been remarkably reduced, such failures now being so rare that their occurrence is considered quite an event in the operation of the system.

CONSIDERATION OF SPECIAL CONDITIONS

Where transformers are operated in parallel on a widespread network it is important that the customers served be encouraged to report poor service promptly and that such reports receive immediate attention. In a good system of secondary distribution the normal drop in voltage should not exceed 3 per cent of lamp voltage. With transformers properly spaced the failure of any single unit will then result in a drop of 12 per cent in lamp voltage for customers very near to the defective unit. Such a drop will result in customers' complaints of poor light as soon as the evening peak comes on. By having a troubleman go to the nearest transformer unit the trouble is at once located and can be corrected before further failures occur.

It frequently happens that heavy concentrated loads, such as those of apartment houses or large buildings, must be served in the same district as that covered by the secondary network. Such loads should not be considered as a part of the network, but should be treated as independent units. In serving these it is best to provide two transformers, each having its secondary connected for say 115 volts, the two being connected in series across the three-wire service line. A continuation of this service line should then be connected to the nearest point of the interconnected secondary network

through fuses of small capacity. The individual bank then becomes a reserve for the network, and the network can be used for emergency service during periods of light load. In the event of failure of either of the individual units the network emergency fuse will blow and one-half of the concentrated load will be deprived of its service. Under this condition service can usually be restored in a short time by having the troubleman advise the tenants to curtail their demands, after which he connects the two outside wires together on the transformer pole pending replacement of the defective transformer. If the character of the load is such that these infrequent interruptions are not permissible, then three units should be installed. If this be done, heavy choke coils must, however, be connected in the leads of each unit, otherwise failure of any one of the three will almost surely interrupt the remaining two owing to the heavy rush of current and very small difference in the time element of the protecting fuses.

Progress for the A. S. M. E. Boiler Code

A bulletin of the American Uniform Boiler-Law Society, dated Jan. 10 and signed by Thomas E. Durban, chairman of the administrative council, shows progress in the legal adoption of the A. S. M. E. boiler code. Prospects are reported in the following states in which legislatures convene during the present year: Georgia, Kentucky, Louisiana, Maryland, Massachusetts, Mississippi, Rhode Island, South Carolina and Virginia. The society is writing to prominent men in these states, including members of the American Society of Mechanical Engineers and the National Electric Light Association, requesting co-operation. The National Electric Light Association, through R. J. McClelland, has written the following letter to the society:

We wish to assure you that the National Electric Light Association indorses fully and heartily the work of the American Uniform Boiler-Law Society, and that you may rely upon our moral support in the various campaigns and representations which you are undertaking. Your work is a most valuable one, not merely to the engineering profession but to the welfare of the country in general. At a time when the industrial resources of the country are being subjected to the most severe test in their history, the measures of efficiency, uniformity and security for which you are working assume proportionately greater importance, and we shall be glad to supplement in any manner practicable the assistance which our small contribution may afford.

Electricity to Help Farm Production

The electrical engineering department of the Iowa State College is planning an extensive exhibit of electric appliances and farm lighting sets for the farm and home short-course week at the college, which will be held from Jan. 28 to Feb. 2. The farmer must help in speeding up production. Electric lighting, electric motor-driven machines and other electrical appliances will serve as important factors in this increased production. With these conveniences the farmer can do faster work with fewer mistakes. This is the belief of the electrical department, which is concentrating every effort to make the exhibit a success. F. D. Paine is electrical engineering representative of the winter short course.

Importance of Water Power Is Shown by War

Benefits of Cheap Power and Conservation of Fuel Far More Valuable to the Nation than Exact Solution of Question of Restricting Return on Capital to Irreducible Minimum

BY CALVERT TOWNLEY

As a representative of the Engineering Council Mr. Townley, who is assistant to the president of the Westinghouse Electric & Manufacturing Company, made the statement of which this is a summary before a special committee of the United States Chamber of Commerce at Washington on Jan. 14. The statement is not an expression of Mr. Townley's personal views, nor of those of any group, but has been submitted to and approved by the executive committee of the Engineering Council.

BEING empowered as it is to speak for the American Society of Civil Engineers, the American Institute of Mining Engineers, the American Society of Mechanical Engineers and the American Institute of Electrical Engineers on matters of common concern to all of these bodies, the Engineering Council's official utterances concern only such underlying principles and economic facts as are indorsed by all engineers and beyond the field of controversy.

Accurate statistics are difficult to obtain, but some approximate totals may prove illuminating. It has been estimated by a careful engineer that in 1911 there was over 26,000,000 steam engine horsepower capacity in use (including railroad locomotives) in the United States. The aggregate water horsepower developed and undeveloped has been computed as around 60,000,000. Of this latter the United States Census of 1912 gives 4,870,000 as developed, and in a report of January, 1916, the Secretary of Agriculture estimates this total to have been increased to 6,500,000. Making liberal allowances for correction in these several figures, it seems probable that there is in service from four to five times as much steam as water horsepower and that there is still undeveloped water horsepower equal to at least twice all the steam power in service.

THE ELEMENTS OF COST

The price for service depends primarily on cost, and cost divides itself naturally into two main items, namely, operation (including maintenance) and fixed charges. As a hydroelectric plant consumes no fuel, its operating cost is less than that of an equivalent steam-driven plant. On the other hand, a steam plant costs usually only from one-fifth to one-half as much per unit of capacity as a hydroelectric plant, so that the latter must carry very much heavier fixed charges.

A power enterprise seldom comes into being with a market for its entire ultimate output. Therefore, when steam is to be the motive power, only such capacity is installed as initial demands require, and the cost per unit is fairly proportional to that of the ultimate development. In a water development, on the contrary, a large part of the cost is for riparian rights, for the dam, impounding reservoir, flume, forebay, etc., and for the transmission right-of-way, towers, etc., which must be at the start largely provided and constructed for the complete installation. In forecasting the commercial prospects of a power enterprise the possible market must be studied, and, of course, a sale price for power

decided upon. As this price is controlled by the cost of similar service from other sources, usually from steam, and as it must be attractive from the start, the additional burden of fixed charges on the initial part of a hydroelectric installation frequently forces the sale of its power below cost. The projectors then must rely for success on a sufficient subsequent increase in their markets.

RIISING COAL PRICE MET BY IMPROVED MACHINERY

The rising price of coal is a matter of record, but it is not so generally known that the improved efficiency of steam-producing machinery (boilers, engines, generators and auxiliaries) has more than kept pace, so that the net cost of producing electric power from coal has steadily declined. As applied to the pre-war period, it may be stated that over a period of ten years the cost of coal has risen on an average 1 per cent per year, while the cost of electric power produced from coal has fallen on an average $2\frac{1}{2}$ per cent per year.

In addition to these facts—still referring to pre-war conditions—the cost of steam-electric generating equipment has been greatly reduced. This fact is due partly to the introduction and subsequent improvement of the steam turbine and in part to the great increase in the size of the units now available. There is nothing to indicate that the limit of improvement in the design of steam prime movers has been reached or is even in sight. It is, therefore, a reasonable assumption that further advances in the art will continue to occur and to cut down both the fixed charges and the operating cost of steam power as a competitor of water. The largest modern steam turbine has now some twelve times the capacity which the largest reciprocating engine had fifteen years ago.

In addition to the development of steam prime movers, the Diesel or the internal-combustion engine is now coming largely into use as a further competitor of water power where fuel oil is available, as in the southwestern district of the United States. The efficiency of these engines is considerably higher than that of the small-size steam turbine and reciprocating engine. There has not been a like improvement in the efficiency nor a comparable reduction in cost of the small reciprocating steam unit, and a natural result has been expansion of the central stations.

The cost of producing power from either water or steam is a function of load. Fixed charges remain practically unchanged in both instances, whether the output in energy be large or small, but with a steam plant increased output means increased fuel consumption, while a water plant operates either with or without load with but little variation in expense. To illustrate by a concrete example representing not unusual conditions, suppose we assume a steam plant using $2\frac{1}{2}$ lb. of coal per kilowatt-hour at a price of \$3 per short ton and having a plant or output factor of 35 per cent.

Under these assumptions the cost of fuel per unit of installed capacity per year would be \$11.50, and if the other operating and maintenance charges be assumed fairly to offset those of a water installation of equivalent size, \$11.50 represents the additional fixed charges which the hydroelectric plant could carry and produce power at an equal cost. If the fixed charges (interest, taxes, insurance and amortization) total 11½ per cent, therefore, the hydroelectric investment per kilowatt capacity could exceed that of steam by \$100.

Stream flow is subject to seasonal variation, and therefore to complete or partial interruption by drought in summer and by ice in winter. Floods are a menace. Long transmission lines may break from wind or sleet or the service be disarranged by lightning. The losses on such lines vary with load and are frequently responsible for annoying pressure variations. On account of these and other reasons hydroelectric power cannot prevail against steam competition at the same or a slightly lower price. It must be materially lower.

THE UNDEVELOPED WATER POWER OF THE WEST

Of the estimated 55,000,000 undeveloped water horsepower in the entire country, approximately 40,000,000 hp. is situated within the boundaries of the thirteen so-called Western water-power states. In these same states the federal government still retains as proprietor 760,000,000 acres, or over two-thirds of the aggregate acreage of all these states taken together. In order to develop power in that section it is therefore nearly always necessary to use some part of this public domain, if not for the dam site itself, at least for flowage, for transmission right-of-way or for some other purpose. Existing law forbids such use except under permit issued by the Secretary of the Interior and revocable without cause, at any time, by himself or his successor in office. It was once believed that revocation would only follow gross abuse well established by evidence, but the drastic action of a one-time Secretary of the Interior some years since to the contrary disabused investors of this confidence. As funds for hydroelectric development must come from private sources, the unstable tenure thus imposed has constituted so great a hazard of loss that the private investor has been loath to assume it. The unfortunate—almost disastrous—result has been stagnation in water-power development.

The several remedial laws recently considered by Congress recognize the essential facts and agree that the remedy is a new law containing the following provisions, namely, an indeterminate permit irrevocable during fifty years except for cause judicially determined, and continuing thereafter unless and until the federal government either renews its permit on mutually agreeable terms or, for itself or through a new permittee, takes over at their fair value the hydraulic works and certain other parts of the development.

The Engineering Council does not consider itself expert in legal matters and will not undertake to discuss the relative merits of the different plans. It should be pointed out, however, that a hydroelectric enterprise being once successfully established, it is alike to the interest of the owners, of the government and of the public that it should continue indefinitely without interruption. There is no economic reason to be served by a cessation, and the only reasons for providing a legal means of recapturing the installation and the water

rights are, first, to preserve an additional measure of government control against possible abuse by the permittee, and, second, against a remote contingency which might make it desirable that the government would want to use the power for some other purpose.

FIFTY YEARS' GROWTH FIVEFOLD TO TWENTYFOLD

A successful power enterprise at the end of fifty years will have multiplied the capacity of its initial installation many times, variously estimated at from five to twenty. In nearly all cases steam plants as well as water plants are necessary to supplement hydroelectric power at periods of low water and in case of interruption, as well as in some instances to provide increased capacity. Modern practice is rapidly approaching that of providing steam capacity equal to 100 per cent of hydroelectric for the purposes stated.

Continuing growth makes burdensome and usually abortive any attempt to amortize the investment, while the investment in other water powers or in steam plants, or both, interconnected with and generally dependent for their economic operation on the original development, renders the right to recapture that development only very onerous and one which constitutes a serious impediment to the free and full development of an enterprise which is otherwise most desirable from all standpoints. With respect to power sites on the public domain and on navigable streams, the government is in the position of seeking to have its resources developed without assuming any business hazard and without contributing either capital or credit.

It would be unfortunate, in the light of past experience, if any new laws which may be enacted should put the government in the position of bargaining with capital and of offering just sufficient incentive not to induce capital to undertake the developments desired, thereby, while apparently providing a remedy, in reality insuring a continuance of the present undesirable condition. Hydroelectric enterprise must compete with the demands of other industries for capital. Experience has shown that even without the imposition of additional financial burdens many of them are not sufficiently attractive to secure development, and as the attractive prospects grade by imperceptible degrees into the unattractive ones, it is perhaps self-evident that every additional burden, however small, transfers a percentage of such projects from commercial into uncommercial prospects.

It is our belief that the benefits afforded the communities served by cheap power, and to the nation by the conservation of coal resulting from the substitution of a self-renewing for a non-renewable natural resource, are far more valuable than is the exact solution of the question of restricting the returns to capital to their irreducible minimum. The present emergency due to the progress of the war has forcibly illustrated the importance of having developed the greatest possible number of water powers as a source of industrial power supply. As it consumes no fuel, the substitution of water for steam power would release to other uses all the extensive railroad and water facilities now engaged in transporting coal. It would similarly release a corresponding volume of labor now occupied in mining this coal and in operating such transportation agencies as well and the boiler-room forces of the steam-power plants themselves.

STATION & OPERATING PRACTICE

A Department Devoted to Problems of Installation, Operation and Maintenance of Equipment for Economical Generation and Distribution of Electrical Energy

RESULTS OBTAINED BY USE OF FUEL-OIL REGULATOR

Supplies Larger Quantity of Fuel Oil to Grates, and by Its Use Oil Is Sprayed Properly and the Draft Is Increased

The Houston Electric Company of Houston, Tex., has recently installed in its plant a device for automatically regulating the amount of fuel oil fed to the furnaces under its boilers. The regulator is arranged to operate with the increasing and decreasing load. In fact, the device is more than merely a fuel regulator. It is an automatic draft, fuel oil and injector-steam regulator which absolutely controls the three essentials to boiler operation when crude oil is used for fuel.

When a sudden load is placed on the main generator of the plant it will naturally cause a drop in the main steam-pressure line. This causes a drop in the steam line which is used for spraying the oil over the grate, as

INSTALLATION OF AUTOMATIC FUEL-OIL REGULATOR

steam for this purpose is obtained through a reducing valve from the main line. This reduction in pressure causes the regulator to function. When this regulator acts, it performs three duties simultaneously: First, it supplies more fuel oil to the grates; second, a greater quantity of steam is released to cause the oil to spray properly, and, third, the draft over the fire is increased. These three operations make the steam come quickly up to standard practice.

The point at which the regulator will function has been selected by adjusting it according to the steam pressure desired and also taking into the account the CO₂ record produced by a Hayes automatic CO₂ recorder. This recorder is interconnected so that it can be used to take readings from any of the four boilers in the boiler room.

An average of the oil consumed from November, 1916, to August, 1917, showed that the plant used 2.1169

lb. of oil per kilowatt-hour. During September, October and November, 1917, since the CO₂ recorder and the automatic regulator have been placed in service, the oil consumption has amounted to 2.010 lb. per kilowatt-hour. These figures show that the automatic operation has effected a saving of 0.1009 lb. of oil per kilowatt-hour. This indicates a saving of 4.95 per cent in the amount of fuel used. Since the company's fuel bill in the average month is \$3,735, it may be seen that the saving effected is 4.95 per cent of \$3,735, or \$184. Since the automatic devices cost only \$390, it will be seen that one will virtually pay for itself at the end of two months.

NOZZLE FOR CLEANING SURFACE CONDENSER TUBES

Description of Outfit Used Which Can Be Operated by One Man—Improvements Over Other Types of Apparatus Used for This Purpose

A simple and efficient nozzle for cleaning surface condenser tubes, which is far more rapid, yet more thorough, than the usual form of rod and brush, may be utilized where air under pressure is available. The cleaning outfit consists essentially of a piece of 1/4-in. (0.6-cm.) pipe bent to shape, a reducer, a 1/2-in. (1.3-cm.) T, a pair of regulating valves and suitable lengths of air and water hose. Air is required under 60 lb. per sq. in. (4.2 kg. per sq. cm.) pressure or more. A check valve should be placed in the air line to obviate any chance of water getting back into the line. The head is taken off at one end of the condenser; at the other end only the hand-hole plates are removed. The nozzle is rapidly moved from tube to tube at the open end, and the dirt, consisting mostly of mud and seaweed, is expelled from the tube by the scouring action of the air and water. After the washing is complete, the ejected mud is scooped out through the hand-holes at the other end of the condenser. By this means one man can clean a 4000-kw., 10,000-sq. ft. (900-sq. m.) surface condenser, containing approximately 3400 15-ft. (4.6 m.) 27 1/8-in. by 3/4-in. (7.3-cm. by 1.9-cm.) tubes, in six hours, not including the time required for removing and replacing the condenser head and plates. The operator must wear a rubber coat and a helmet.

It is stated by the station operators of the San Diego Consolidated Gas & Electric Company, who utilize this form of nozzle, that this method of cleaning is a great labor saver. When the air and water nozzle was first used hollow cylinders of mud and sewage were ejected from many of the tubes, showing the new method to be a decidedly thorough cleanser. It is understood that some central stations use sand blasts for cleaning tubes. With the particular forms of sediment encountered in San Diego, no scale being present, sand appears to be unnecessary, and the wearing action which may result from the use of sand is not experienced.

CHECKING SYNCHROSCOPES FOR USE IN PHASING OUT

Dangers of Crossed Connections Must Be Eliminated—Method of Using Synchroscope for Phasing Out Apparatus

BY C. OTTO VON DANNENBERG

It is an interesting fact that while much valuable and useful information has been published covering various methods of phasing out generators, transformer banks and circuits, there seem to be few actual published data available covering the checking and putting into operation of the synchroscope. The following method is neither new nor original, but the writer does not believe that it has received the publicity and consideration that it merits:

The synchroscope most universally used is of the single-phase type, and, assuming that the connections of the circuits under consideration have been checked, the wiring will be in general as in Fig. 1 for a three-phase circuit. Only the necessary connections under consideration have been indicated, and in this case it is assumed that two three-phase generators are about to be paralleled and that the phase rotation has been found by test to be correct. The generated voltage is assumed to be of such a value as to require the use of potential transformers to step down to the operating voltage of the synchroscope.

With the connections as indicated and the "machine-starting" and "machine-running" plugs inserted in receptacles B and C respectively, it might be assumed in general that the oil circuit breaker of the "starting machine," generator No. 2, could be closed when the lamps were dark and the synchroscope pointer was at rest just over the mark at the upper part or top of its scale. This would be in accordance with the general method in use in the United States. It so happens, however, that it is not an unusual or exceptional occurrence to find potential transformers, even of the same make, with terminals wrongly marked for polarity or leads wrongly brought out of the case, so that the connections of the different transformers would not be symmetrical. This condition would give crossed connections which would cause the lamps to be bright at synchronism and the synchroscope pointer to take a position exactly 180 deg. away from its correct location, so that closing breaker No. 2 with the lamps dark and the pointer at the top of the scale might cause serious damage to either or both generators, or at the least a considerable disturbance on the system, since it is seldom, except in the smallest stations, that one finds generator breakers set for automatic operation.

To obviate any difficulty of such a nature a positive assurance of the correctness of the connections may be obtained by first disconnecting the leads of No. 2 generator at its terminal board, or at a point such as A, and then closing the oil circuit breaker No. 2. The conditions then existing will be the same as at synchronism, and the lamps will be either bright or dark and the synchroscope pointer will assume either an upper or lower position.

If the pointer comes to rest in the lower position and the lamps remain bright and it is desired to have the lamps dark, the leads of the potential transformer of generator No. 2 should be reversed; if, however, it is

pointer of the synchroscope may be loosened on its shaft and shifted to its upper position. The No. 2 generator switch may now be opened, the leads reconnected and the machine put in service. While lamps are nowadays seldom used as a permanent synchronizing arrangement,

SYNCHRONIZING WIRING FOR TWO THREE-PHASE GENERATORS

they are usually an adjunct to a synchroscope, and the method described applies obviously as well when lamps alone are used for this purpose.

INSTALLATION OF MEASURING DEVICES HELPS GOOD FIRING

Recording Pressure Gage Assisted in Removing
Laxity of Firemen, and Orsat Machine
Helps Discover Air Leak

The one 550-hp. and two 410-hp. Edge Moor hand-fired four-pass boilers at the plant of the Iowa Falls (Iowa) Electric Company were being stoked in a more or less haphazard fashion when a new chief engineer was hired. The first thing he did was, in his own language, "to let things go blindly, as they had been going, to get a line on the firemen." This resulted in the discovery that firemen were piling a lot of coal into the furnaces, then sitting down leisurely while the steam ran up to the popping-off point and then dropped back 25 lb. or 30 lb. per square inch (1.75 kg. or 2.1 kg. per sq. cm.). At this stage they would "slug" the fire again. This was the cycle of operations day after day.

This resulted in the installation of a recording steam pressure gage. It required very little encouragement to create a friendly rivalry between shifts to see which could make the best charts. Now these same firemen have become so proficient that, with only an occasional glance at the chart, they keep the pressure range within 5 lb. per square inch (0.35 kg. per sq. cm.), which is very good for hand firing.

When this stage was reached the chief engineer, using a single Orsat machine, decided to look into the condition of the CO₂. The first samples taken from the first pass showed from 5 per cent to 6 per cent, indicating about a 35 per cent loss of fuel. The draft was then cut down over the fires and increased under

CO₂. While accurate draft-measuring instruments were not available, this procedure as a cut-and-try process was continued until the samples of CO₂ showed 13 per cent to 14 per cent and it was possible to carry the peak load without changing the draft. The draft is now about 0.3 in. (0.7 cm.) over the fires.

When the first pass showed this much improvement, samples were taken in the last pass. These showed 8 per cent CO₂. Experiments with the third pass gave the same results, showing that the baffling was all right. A search for air leaks was then started, which revealed a bad leak in the header. After this was stopped it was possible to get as high as 15 per cent CO₂. The boilers are now covered with a plastic cement which is very effective in keeping out air. On the whole, the plant is operating much more efficiently, owing to the installation and use of proper measuring instruments.

CONVENIENT ARRANGEMENT OF FUSES ON FEEDER PANELS

Fuses Are Mounted on Boxes Forming Side Inclosures of Rear of Panel—Details of Arrangement

BY H. BURT FOOTE

Considerable waste of space and an unsightly installation have usually been found to result from the design of feeder panels in which bus connections and fuses are a part. On several occasions the writer has found it necessary to design feeder panels for three-phase, 440-volt and 500-volt alternating-current circuits. As a result of some thought and consideration of the requirements the construction shown herewith has been

ARRANGEMENT OF FUSES AND DISTRIBUTION BOXES

worked out. Switches of 600-volt spacing in ratings of 30 amp. and 60 amp. combined with 600-volt fuses usually make an awkward arrangement.

Uniformity in the switches may be secured by using the 100-amp. size with 250-volt spacing, and this is

also permissible for 600 volts alternating current and adaptable to circuits up to 50 hp. This switch possesses enough mechanical strength to adapt it to general use, which is not true of the 30-amp. and 60-amp. size with 600-volt spacing. Placing fuses on the front of a panel increases its size, making additional expense and a waste of space. As ordinarily placed on the back of a panel, they cover a portion of the studs and bus connections, making it difficult to tighten up a loose joint and inconvenient to get access to the outgoing feeders. These difficulties have been overcome, and the fuses are so placed that they bear a direct relation to the switches and that the connection from switch to fuse is reduced to a minimum.

The distribution boxes on which the fuses are mounted are made of sheet metal fastened as shown to the panel supports and forming a side inclosure for the back of the panel. The conduit enters them in a neat manner at top or bottom, and the wires are led direct to the fuse blocks through a bushed hole. Where more than one panel is used the adjacent boxes may be combined in one. The front-connection fuse blocks make them interchangeable for any size of circuit. The busbar construction will be found to be very simple and accessible.

ELECTRIC PUMPING COSTS IN MIDDLE WEST STATE

Bulletin Issued by the Iowa Engineering Experiment Station States that Such Pumping Is Most Economical

According to H. W. Wagner, mechanical and electrical engineer for the Engineering Experiment Station at Ames, Iowa, in bulletin No. 46, entitled "Electric Pumping, with Results of Tests and Operating Records," in most Iowa cities and towns the first cost of municipal waterworks is between \$100 and \$150 per connected service. This report is based upon data and experience obtained in co-operation with the Iowa Section of the N. E. L. A. and many operators of pumping plants.

Many towns with as small a population as 300 to 500 have public waterworks. Only in exceptional cases does the municipality receive sufficient revenue from the sale of water to pay all operating expenses and legitimate fixed charges. A large part of the waterworks investment is due to fire protection. "A careful study and analysis of the average problem," the author states, "indicates that, with a reasonable rate for energy, pumping by electricity results in a lower total of fixed charges and operating expenses than does pumping by any type of engine."

The following is a summary of the information contained in several tables in the bulletin:

	Approximate Average	Approximate Range
Single-stage pumping:		
Daily pumpage, gallons.....	260,000	40,000-1,000,000
Total head or lift, feet.....	155	14-305
Kw.-hr. per 1000 gal. (eighteen plants)	1.08	0.50-1.82
Rate in cents per kw.-hr.....	3.58	1.5-6.0
Double-stage pumping:		
Daily pumpage, gallons.....	66,000	25,000-135,000
Total head or lift, feet.....	300	150-525
Kw.-hr. per 1000 gal. (six plants)...	4.39	1.16-9.00
Rate in cents per kw.-hr.....	3.15	1.7-5.0

The higher costs are in cases of the stage pumping when the air lift is used in the first stage.

CENTRAL STATION SERVICE

A Department Devoted to Commercial Policy and Management
Topics, Including Applications of Electric
Light, Power and Heat

COMMENDABLE FEATURE FOR CENTRAL-STATION PUBLICITY

By Showing the Public the Way to Conserve Fuel
Through Lighting Economy Government's
Cause Is Helped

There seems to be a great opportunity to-day for the central station to emphasize in its publicity matter the service idea and how the electric lighting utilities can and do fit in with the government's war program.

Our Christmas War Message Economize On Electricity

So serious is the coal situation that we ask our clients to help us—and by helping us, to help the Government—by lessening their consumption of electricity.

Electricity is such a blessing,
and costs so little, the temptation
is to be extravagant in its use

If everyone will use only what they actually need,
the total amount saved will be considerable.

And be sure to keep your lamps
clean and in good order that you
may get full measure of service
from the electricity you pay for

United Electric Light Co

EDUCATIONAL PUBLICITY ON HOW TO CONSERVE FUEL THROUGH SAVING IN LIGHT

One of the greatest problems the country now has to face as a result of the war is the coal situation. In this matter the lighting companies have a definite part to play in educating the public to the necessity for economy when it will tend to conserve fuel. It is recognized that a saving in fuel will result from the economical use of electric light.

Particular and concrete ways are open to the utility in this educational publicity. The use of small units in bathrooms, halls, etc., where a high degree of illumination is not required and the use of only such units as are necessary are two such ways. There is a third way

on which considerable emphasis can now rightly be laid, and that is the elimination of the carbon-filament lamp. Using as it does about three times as much energy as the vacuum-type tungsten lamp, its waste of energy is considerable.

A CLASSIFICATION OF KILOWATT-HOUR SALES

Figures of Rochester Company Show the Relative
Percentages of Total Sales Utilized in
Different Types of Load

A classification of kilowatt-hour sales for 1916 has been made by the Rochester (N. Y.) Railway & Light Company, showing the sales to each industry. This classification shows that, aside from the energy sold to railways, which was 35.4 per cent of the total, the largest load was for miscellaneous industrial business, and next was municipal lighting.

BUSINESS CLASSIFICATION OF ROCHESTER COMPANY FOR 1916

Types of Load	Kw.-hr. Sales	Per Cent of Total
Apartment houses.....	405,366	0.337
Residences.....	4,224,457	3.510
Offices.....	710,493	0.590
Department stores.....	405,563	0.337
General corner-store lighting.....	5,937,616	4.925
Drug stores.....	329,214	0.273
Churches.....	251,501	0.209
Public garages.....	1,252,902	1.040
Private garages.....	352,881	0.293
Theaters.....	971,315	0.808
Eleemosynary institutions.....	208,298	0.173
Restaurants.....	644,522	0.535
Saloons.....	1,656,528	1.375
Hotels.....	1,515,226	1.260
Breweries.....	538,563	0.448
Printing establishments.....	824,345	0.685
Clothing manufacturers.....	1,155,358	0.960
Machine shops.....	4,571,574	3.800
Contractors.....	2,622,531	2.180

PUBLIC IS NOW BUYING MORE EXPENSIVE ARTICLES

View Expressed that the Day of Going After the Small Appliance Market Is Past—Selling Sweepers Rather than Flatirons

An interesting point of view on the trend of the electric appliance market is voiced by William J. Barker, vice-president and general manager of the Denver Gas & Electric Company, in the January *Doherty News*. Mr. Barker says:

The day of going after the market for small appliances, like flatirons, is past and the public has been educated to the point where it realizes perfectly the advantages of electricity in the home and consequently is buying the more expensive articles. Sales aggregate a larger sum per sale than ever before. A striking instance is the recent Hoover suction sweeper campaign, during which 510 machines were sold, totaling \$29,896, in a period of one month.

SALES OF WOOD WASTE PAY BILL FOR POWER

Little Rock Company Now to Make Effort to Connect Up Other Plants in Its Territory That Use Waste as Fuel

The Nowlin Lumber Company of Little Rock, Ark., which has an electric power installation of 125 hp. in motors ranging in size from 2 hp. to 30 hp., has just made an interesting statement to the Little Rock Railway & Electric Company. This company has been taking central-station energy for some time. In the past its very large amount of shavings and waste wood had been employed as fuel and there was no prospect of disposing of this by-product advantageously. Recently, however, Mr. Nowlin informed the lighting company that it had been successful in finding a market for this waste and that it is now selling enough of it more than to pay its entire bill for electric power.

On the strength of this the lighting company's commercial department is planning to make a special campaign among all industries which use wood waste or shavings, either partly or entirely, as fuel. The company believes that electric power offers unquestionable advantages in efficiency and naturally feels that it can safely undertake to find a market for the waste as a further inducement.

SELLING PREFERRED STOCK TO THE CITIZENS AT HOME

Portland (Ore.) Company Offers Its Securities to Residents of the Territory That It Serves and Its Own Employees

Under present financial conditions in the principal money markets of the country, the difficulty of securing funds is becoming a more serious matter every day to the utilities. One plan, however, that seems to produce results even when money is particularly tight is that of selling securities to the public in home territory.

Within the past three years a number of companies have tried out this scheme for raising funds, and in every instance, so far as records show, they have been more successful than was anticipated.

During the months of December and January the Pacific Power & Light Company of Portland, Ore., has carried on an active campaign for selling its preferred

stock. The principal reason for this campaign, the company states, is to secure a greater distribution of stock among residents of the territories it serves and its employees. It says:

The interest of our customers and the employees of the company is mutual. Our growth and welfare is closely interwoven with the advancement of each and every one of the communities we serve. Each customer who is a stockholder, we believe, will take a more active interest in our company, and it is this interest that every large company wants and must have to be a success.

For a given amount of stock, a large number of holders are desired in preference to a few large stockholders. The importance of making this campaign is great. Every employee, whether in the office, a lineman, a meterman or a power-department man, we hope will do all within his power to do his part in actually selling the stock.

LARGE INCREASE IN USE OF ELECTRIC APPLIANCES

Shortage of Domestic Labor and Higher Wages Are the Important Factors in Bringing This About

During the year just closed the sale of electric domestic appliances showed a tremendous advance. Almost all utilities found it easier to sell these goods in 1917 than ever before, in spite of the higher prices. It is well known that the manufacturers enjoyed a much increased business.

There are a number of factors that have entered into this situation. The greatest probably was the growing scarcity of domestic labor. Many households found that it was virtually impossible to secure help, while, owing to the high wages demanded, others found it to be too expensive. Another factor in the increased purchase of appliances has been the better earnings received by the wage earners generally.

In this connection a few reports from the Byllesby utility companies are of interest, as follows:

A total of 13,545 electrical appliances were placed on the Minneapolis General Electric Company's lines during the period from Jan. 1 to Nov. 1, 1917. Electric flatirons were the most popular of all devices sold, the total numbering 4601. Electric vacuum cleaners were next, the total being 3091. The other appliances in the order of number of sales ranged as follows: Toasters, 987; washing machines, 612; heating pads, 401; grills, 384; curling irons, 343; percolators, 324; ranges, 223; air heaters, 214; vibrators, 154; water heaters, 138; luminous radiators, 96; chafing dishes, 85; hot plates, 84; miscellaneous, 1807.

The compilation is interesting also from the standpoint of showing which months were the most popular appliance months. It indicates that May and September for 1917 at least were the heaviest ones in this respect, although August and November follow closely. January was the poorest month for appliance sales, owing no doubt to the fact that this month follows immediately after the holiday appliance campaign.

Without any special effort the Oklahoma Gas & Electric Company and the dealers of Oklahoma City were successful in selling 855 electric household appliances during the months of September, October and November. The list includes the following: Vacuum cleaners, 305; flatirons, 240; heaters, 91; curling irons, 48; toasters, 35; grills, 35; washing machines, 25; percolators, 24; heating pads, 18; sewing-machine motors, 15; water heaters, 10; fans, 9.

At San Diego, Cal., 3734 appliances were sold in the first ten months of the year. At Mobile, Ala., 1311 were sold in the same period. At Louisville, Ky., 3222 were sold. At Stockton, Cal., 2406 were placed on the company's lines through combined efforts of the company and the dealers.

TECHNICAL THEORY & PRACTICE

Including a Digest of Important Articles Appearing in
the Scientific and Engineering Press
of the World

Generators, Motors and Transformers

Rational Theory of Closed Windings.—A. ILIOVICI.—A study of the theory of drum windings independently of ring windings, containing simple formulas and a new presentation of the subject applicable to all sorts of windings.—*Revue Générale de l'Electricité*, Dec. 1, 1917. (Abstracted from the *Bulletin de la Société Internationale des Electriciens*.)

The Electrical Generating Plant of Larderello.—P. GINORI-CONTI (*Elettrotecnica*, Sept. 15 and Sept. 25, 1917).—This plant utilizes the natural heat of volcanic steam jets for heating steam-generating boilers driving turbo-electric generators. The energy generated by this installation is furnished to the principal electricity-distributing companies of Tuscany. The favorable results obtained have encouraged the proprietors of the "soffioni," as the volcanic steam jets are called, to extend them. Investigations are being made for this purpose, the direct application of the natural steam to the driving turbines having been decided on. Many illustrations and numerous details of construction are contained in the article.—*Science Abstracts*, Section B, Nov. 30, 1917.

Lamps and Lighting

Control of Lighting.—By an order dated Dec. 24 the Ministry of Munitions has obtained extensive powers with regard to the control of lighting. The ministry may, "with a view to maintaining or increasing the supply of light, heat or power for the purpose of production, repair or transport of war material, or any other work necessary for the successful prosecution of the war, by order direct that lights of any specified class or description shall be extinguished or their use restricted to such extent, between such hours, within such area on such premises, and during such period, as may be specified in the order, and if any person having control of any light or occupying, or having control of, or managing, or being in charge of premises in or in connection with which any light is used, acts in contravention of any such order, he shall be guilty of a summary offence against these regulations."—*London Electrician*, Jan. 4, 1918.

Ideals and Near-Ideals in Lighting Units.—HAROLD W. BROWN.—The author brings out some of the important features which should be embodied in lamps and reflectors. Among them are amount of light, distribution of light, invisibility of the filament or other source, diffusion of light, diffusion of illumination, color of light, low cost of the unit, efficiency of the unit, durability of the unit and ease of cleaning.—*National Electrical Contractor*, January, 1918.

Historical Lighting of Independence Square, Philadelphia.—E. F. KINGSBURY.—The paper describes the new historical lighting recently installed in Independence Square. The units are described in detail and several photographs of different units are shown. Con-

siderable material of historical and educational interest is included, descriptive of early lighting installations in Philadelphia after which the equipments were copied.—*Transactions of Illuminating Engineering Society*, Dec. 31, 1917.

Generation, Transmission and Distribution

Determining Stray Power of a Transmission Line.—D. D. EWING.—In transmission lines operating at very high voltages, 60,000 or higher, losses over the insulators and through the atmosphere assume formidable proportions. These losses, or rather the cost of mitigating them, form a considerable factor in limiting the voltage. At high altitudes the loss is very serious, owing to the rarefaction of the air, which loses its insulating properties at low pressure. In this article the author presents the results of some studies conducted on an electric railway line in the Middle West. With the comparatively low voltage of 33,000 volts used on the line tested, the leakage losses are not serious, but the results clearly illustrate the principles involved.—*Electric Railway Journal*, Jan. 12, 1918.

Steam Turbines.—A symposium which describes different types and classifications of turbines, including vertical, horizontal, single-flow and double-flow, bleeder, mixed-pressure, exhaust and reversing turbines. Piping systems for various turbine arrangements, determination of proper sizes and shapes of turbine nozzles, blading, turbine wheels, blade rings, governors, cylinders and foundations are taken up. The effects of variation in steam pressure, superheat, vacuum and size upon economy of steam turbines are also discussed.—*Power Plant Engineering*, Jan. 1, 1918.

Air Pumps and Condensers.—A new application of the steam jet to vacuum production has recently been suggested by D. B. Morison. From the experiments carried out it appears that if a 25-in. or 26-in. (63.5-cm. or 66.0-cm.) vacuum will satisfy requirements, this can be obtained more cheaply and maintained more certainly by the use of auxiliary steam jets than in any other way. By interposing steam jets between the condenser and the pump, these jets, which, as is well known, have a great volumetric capacity, compress the air into the pump suction, so that a large weight of air can be abstracted with a very moderate pump displacement. The great advantage of this in the present shortage of brass and other copper alloys lies in the fact that the amount of cooling surface in the condenser can be reduced 20 per cent to 25 per cent without loss of vacuum, and the air pumps may also be much smaller than is called for in ordinary standard practice.—*London Engineering*, Dec. 21, 1917.

The Aluminum Transformer.—M. VIDMAR (*Elettrotechnik u. Maschinenbau*, July 8, 1917).—Scarcity of copper has led to the construction of transformers with aluminum windings, but the author contends that it is possible even in normal times to build air-cooled trans-

formers cheaper and lighter if aluminum be employed instead of copper. The ratio of the prices of insulated aluminum and copper wire is taken as 1.4:1.0. In the most economical design of transformer with copper windings it is necessary to leave considerable spaces between the coils in order to obtain adequate cooling. When aluminum windings are used this space can be conveniently reduced without prejudice to the temperature rise. Owing to the relatively greater proportion of the cross-section of the coils which is occupied by metal, the difference between internal and external temperatures is less with aluminum windings than with copper. The difficulty of making joints in the winding is rather serious. An example of an aluminum design is given—a 100-kva. transformer which has been built by the author.—*Science Abstracts*, Section B, Nov. 30, 1917.

Installations, Systems and Appliances

Power-Plant Installations for By-product Coke-Oven Plants.—GEORGE B. EVANS.—Factors taken into consideration when designing the power plant for the St. Louis By-product Coke Plant. The author calls attention to the types of drive and control desirable for such plants and the purposes for which steam is required. Three methods of securing the energy for operating such a plant are discussed and reasons are given for selecting the equipment used in the St. Louis plant. The electrical and steam demands on this plant are tabulated, the latter indicating that the cost of the power house would not have been much less if no electrical machinery had been installed.—*Journal of the Engineers' Club of St. Louis*, November-December, 1917.

Condenser for Power Circuits.—Description of commercial method of making static condensers for power circuits. It is said that the losses in these condensers are only about 0.3 per cent. For any particular frequency the capacity required to give a definite output in kva. varies inversely as the square of the voltage. At very low pressures—that is, less than 660 volts—the kva. output can be increased by using inductances in series with the condensers, thus increasing the pressure across them. In one case cited, furnishing 100 leading kva. to a 200-volt circuit at 50 cycles, 64 per cent less capacity is required by inserting inductances raising the voltage across the condensers to 550 volts. A chart is included indicating the amount of capacity required per kilowatt of load to raise the power factor from any value to any other value.—*London Electrician*, Jan. 4, 1918.

The Modern Cargo Crane.—CLAUDE M. TOPLIS.—The relative advantages of the electric, steam and hydraulic types of crane are first outlined and typical designs are briefly given. For the handling of cargoes speed is of first importance, and therefore this desideratum should be borne in mind in the equipment that is provided. Details are described for giving the various motions—hoisting, slewing and luffing—and reference is made to the wear of ropes.—*London Electrician*, Dec. 14, 1917.

Power-Plant Instruments as an Investment.—M. A. SALLER.—Seventh installment of a series on this subject. This particular article dwells on the benefits to be derived from the use of steam-flow meters.—*Power Plant Engineering*, Jan. 15, 1918.

Wires, Wiring and Conduits

Determination of Size of Wire for a Lighting Circuit.—HAROLD W. BROWN.—The author points out that it should be remembered that three matters are to be considered with reference to determining the best sizes of electrical conductors, unless past experience has shown that some of them can be omitted: (1) The wires should be strong enough for safety to life and property; (2) they should be of such size that the total annual expenses chargeable to the line are not excessive; (3) they should be large enough so that the line drop is not excessive. The author gives a simple method for finding the best size wire to use, taking into account the three above points.—*National Electrical Contractor*, January, 1918.

Electrophysics and Magnetism

Electrometallic Influences Exerted Across Very Thin Insulating Substances.—EDOUARD BRANLY.—A paper read before the Académie des Sciences recounting experiments made with a leaf of mica between 0.004 mm. and 0.005 mm. in thickness, where the lower disks were of pure silver and the upper disks in three different experiments were respectively of pure silver, of platinum of 32 mm. diameter, and of cobalt. The author concludes by saying that if unipolar conductivity does not in itself have much theoretical interest, it leads to the knowledge that metallic surfaces of different natures placed opposite each other exercise a specific exterior influence upon the intermediary substances under the influence of even a feeble emf. at distances great enough to be measured directly.—*Revue Générale de l'Electricité*, Dec. 15, 1917 (abstracted from *Comptes Rendus des Séances de l'Académie des Sciences*).

A Graphical Method for the Construction of Electrostatic Fields.—SYLVAN J. CROOKER.—A graphical method is explained which permits the construction of any electric field, or the solution of La Place's differential equation. As an example, the field for a thin wire strung through a circular hole in an infinite plane is given. This field is representable by $w = \cosh Z$.—*Journal of the Franklin Institute*, January, 1918.

Wet Condenser Suitable for Continuous High-Potential Service.—One-liter Pyrex glass beakers containing a nearly saturated solution of common salt were immersed to a similar depth in a solution contained in an earthen vessel. The place subjected to greatest danger of puncture and that which allows greatest leakage is where the exposed surfaces of the solution inside and out come in contact with the surface of the beakers. The effect can be reduced considerably by filling the beakers to a slightly different level from that of their containers. Care should be taken not to wet the portion of the beaker that is not immersed. To eliminate sparking the surfaces of the solution inside the beakers and that surrounding the beakers were covered with a layer of oil 5 cm. deep. For this purpose a 300-deg. mineral seal oil was used. The capacity of these condensers was estimated at 0.0092 mfd. A similar estimation of the capacity of two such beakers covered with tinfoil indicated that their combined capacity was very appreciably less than two beakers of the wet condenser. The capacities were 10 per cent higher using mercury than when using the salt solution.—*Science*, Jan. 4, 1918.

Units, Measurements and Instruments

Electrical Resistance of the Human Body.—Results obtained from measuring the resistance of the human body to electric currents vary from 500 ohms to 8000 ohms and even more. According to a note by Dr. Nixdorf of Berlin, appearing originally in *Elektrizität* of that city, these enormous differences are due to the employment of defective methods. When an excessive continuous voltage is used muscular contractions and nervous excitations ensue which falsify conclusions. Experiments made by Dr. Nixdorf and Professor Brandenburg have brought consistent results. They used both direct and alternating current—in the first case at 1 millivolt, corresponding to the action of the heart; in the second case replacing the slide-wire of a Wheatstone bridge by a trough filled with a solution of sulphate of zinc. The subject plunged his arms or his legs into salt water at the temperature of the human body and resistance was measured between the arms, between the legs and between one arm and one leg, the experiments being repeated after two weeks' time. The results are tabulated as follows:

	RESISTANCE TO DIRECT CURRENT, OHMS		RESISTANCE TO ALTERNATING CURRENT, OHMS	
	Arm to Arm	Leg to Leg	Arm to Arm	Leg to Leg
Healthy countryman (59 years)	1100	1400	233	350
Woman with nervous malady.....	1000	1200	255	455
Diabetic patient.....	1500	1700	284	434
Man (65 years) while in attack....	2000	3100	224	414
Man with softening of brain.....	1800	2800	299	414
Ditto.....	1400	1400	270	480

When the subject was apprehensive the resistance, measured with direct current, was found to be greater than when he was tranquil, 1700 ohms from arm to arm and 1500 ohms from leg to leg being recorded in the first state and 1000 ohms from arm to arm and 1200 ohms from leg to leg in the second state.—*Revue Générale de l'Electricité*, Dec. 1, 1917.

Standardizing Methods of a Modern Utility.—WILLIAM F. JOHNSON.—Description of the testing facilities of the Philadelphia Electric Company's standardizing laboratory. The policy followed in conducting tests is outlined.—*Journal of the Engineers' Club of Philadelphia*, January, 1918.

Telegraphy, Telephony and Signals

New Results on Testing Telephone-Switchboard Cables.—F. LANGE (*Elektrotechnische Zeitschrift*, Sept. 6, 1917; communication from the German Telegraphs Experiment Station).—With regard to the design of cotton and silk cable, two points especially need to be considered: (1) Limitation of space, (2) absorption of moisture by the insulating material. The first is met by making the cables flat and ribbon-shaped. In connection with the second, twin leads of 0.6, 0.5 and 0.8 mm. section, having capacities in the ratios 1:0.82:1.62, showed leakage in the proportion 1:0.72:2.1. Cable soaked in beeswax was very much less influenced by atmospheric moisture than any of the other cables tested; the core had been insulated in the

usual manner, dried in vacuum and plunged into hot beeswax, the whole being covered with cotton braiding.—*Science Abstracts*, Section B, Nov. 30, 1917.

Miscellaneous

Notes on the Electric Equipment of Machinery for the Handling of Materials.—Continuation of an article on the same subject. In this part a number of points are discussed in regard to what may be termed the details of electrical equipment. These include motors, speed regulations, electric braking, controllers, resistors and switchgears.—*London Electrician*, Jan. 4, 1918.

Hydroelectric Energy as a Conserver of Oil.—H. F. JACKSON and F. EMERSON HOAR.—Possibilities of further conservation of California petroleum by the more extensive and efficient utilization of hydroelectric energy that can be made available by the interconnection of the more important transmission systems.—*General Electric Review*, January, 1918.

Life of Impregnated Wooden Poles.—F. MOLL.—An article giving the results of treating wooden poles as they have been worked out in Europe and America during many years. The average life of treated poles, according to the statistics of the telegraph administrations, follows: Unprotected poles, five to seven years; poles covered with a coat of carbolineum, six to eight years; poles impregnated with chloride of zinc, twelve years; poles impregnated by the Boucherie process (sulphate of copper), fourteen to fifteen years; poles impregnated with sublimate (cyanization), seventeen years; poles impregnated with oil of goudron, twenty-three to twenty-five years.—*Revue Générale de l'Electricité*, Nov. 24, 1917.

Book Review

EMPIRICAL FORMULAS. By Theodore R. Running. New York: John Wiley & Sons, Inc. 144 pages, illustrated. Price, \$1.40.

The subject of empirical formulas is not of great importance in pure mathematics, and perhaps that is why its literature has never been greatly developed. In applied mathematics generally, and in engineering particularly, empirical formulas are often very important, because when a graphical relation has been established between two or more physical quantities it often becomes very desirable to discover what laws may be represented by that relation. A step in the process of discovery may be the determination of an empirical formula applying to the case. The author has made a distinct contribution to this important subject, especially from the standpoint of technology. The subject matter is divided into eight main chapters relating to topics that may be expressed as follow: Arithmetical series, arithmetical-series exponentials, geometrical series, special series, periodic series, least squares, interpolation, integration. The order of development is clear and logical. The text is abundantly illustrated by curves and graphs, which lend great assistance in the comprehension of the subject matter. The book will be found to be of very considerable value not only to the practising engineer and to engineering and technical students but also to all mathematically trained observers interested in its subject.

Manufacturing Fields

CONFERENCE CLUB TALKS ON ADJUSTMENT OF WAGES

"Adjust Wages Periodically on Basis of 'Index Numbers' Showing Increase in Cost of Living,"
Proposed by L. K. Comstock

The Conference Club, the organization of the large electrical contractors doing an interstate business, met at Asheville, N. C., on Jan. 17 to 19. The feature of the program was an epochal paper on a plan for the automatic adjustment of the wages of labor by L. K. Comstock of L. K. Comstock & Company, New York.

Mr. Comstock's proposal related to the periodic adjustment of wages on the basis of the "index numbers" compiled by various authorities showing the rise in the prices of commodities that make up the cost of living. Mr. Comstock presented curves illustrating the close agreement of the index numbers, covering the last eighteen years, variously and separately compiled by Bradstreet, Dun, Gibson and the Department of Labor.

Assuming that three-quarters of the wage earner's outlay for the necessities of food, clothing and shelter follows the trend of these index numbers, Mr. Comstock suggested that if, for example, the accepted index number for April 1, 1917, was 190 and it rose to 220 by Oct. 1, 1917, an increase of 15 per cent, a corresponding increase should be granted on three-quarters of a given worker's wage.

Thus an electrical worker receiving \$5.20 a day April 1, 1917, would be entitled to an increase of 15 per cent on three-quarters of \$5.20 (\$3.90), or a cash increase of 60 cents a day, making his readjusted wage as of Oct. 1, 1917, \$5.80 a day. Such adjustment would preserve his relative earnings unchanged, compared with the rising cost of living.

Such a plan of adjusting wages has the merit of immediate practicability, declared Mr. Comstock. For years the United States Department of Labor has compiled and published an index number which would serve every purpose, while having the stamp of authority. The plan might be started by arbitrarily accepting wages now prevailing in each locality as the local base rate.

EMPLOYER AND MECHANIC NEED EACH OTHER

Mr. Comstock's proposal for scientific wage adjustment was introduced by a comprehensive review of the conditions surrounding the relation of employers and labor. He urged that both employer and mechanic frankly admit that neither can get along without the other and asked that, making a virtue of necessity, the employer study sympathetically the needs and requirements of his men, and likewise that the union see to it that its men work faithfully and sympathetically for their employers.

E. E. Van Cleef of L. K. Comstock & Company, Chicago, read a paper on "Co-operation with Labor."

He urged franker confidence between employer and mechanic, in the knowledge that their larger interests are identical. Mr. Van Cleef declared that much of the destructive "cheap" competition suffered by the reputable contractor would be avoided if electrical unions recognized that their best interests are served when electrical labor is secured through the electrical contractor. He urged further that the unions aid in correcting the situation by opening their doors to non-union workers who apply.

William L. Goodwin, New York, spoke on the desirability that the electrical contractors take trade acceptances from customers as well as give them in payment of purchases. Giving trade acceptances is evidence of ability to pay, said Mr. Goodwin, and he urged particularly that the strong companies put the acceptance plan into operation at once, even partially.

CONSTRUCTION CANTONMENT SITUATION IN WASHINGTON

The construction contract situation in Washington was presented in a report by Sullivan W. Jones.

It was shown that the lack of uniformity in these policies, the absence of co-ordination of departmental activities, the efforts of departments to preserve their prerogatives, the inherited prejudice against exchange of opinion and data between departments, had led to the overlapping of programs, confusion, congestion in the material market and delay. This phase of the situation was developed quite fully, although, as Mr. Jones said, many of the Conference Club members were familiar with it, because it suggested its own cure—the centralization of control and the adoption of a uniform policy.

The order issued by the Secretary of War on Nov. 5 transferring the control of all army construction work to the cantonment division of the Quartermaster's Department and the appointment of General Goethals as acting quartermaster general were pointed to as steps taken to effect such centralization. The belief was expressed that the government must and would undertake shortly the purchase of all materials required, in order to provide scientific distribution of work and fullest utilization of all forces of production.

The contractor, Mr. Jones stated, is an instrument of production, and the application of the same policy of control to the actual work of construction would unquestionably lead to a change in relations between the government and the contractor. It was prophesied that the time is not far distant, if the war continues, when the contractor as well as the manufacturer will come under government control and will be employed as an expert in a professional capacity for a stipulated fee, which would probably have no relation to the cost of the work.

L. K. Comstock was re-elected president of the Conference Club, W. C. Peet was re-elected treasurer, and Sullivan W. Jones was appointed secretary.

CONTRACTORS' ORGANIZATION IS LAUNCHED IN ST. LOUIS

W. C. Peet Is Elected First President of the New National Association of Electrical Contractors and Dealers

Representing twenty-two state associations of electrical contractors which adopted the plan of organization approved at the New Orleans national convention last October, members of the executive committee of the new National Association of Electrical Contractors and Dealers met at St. Louis on Tuesday, Jan. 22, and formally launched the organization.

Past-president Robley S. Stearnes, New Orleans, was elected temporary chairman, and after submitting his presidential report with suggestions for the new association in 1918 he appointed a nominating committee headed by J. A. Fowler, Memphis.

Reporting later in the day, Chairman Fowler paid a

PRESIDENT W. C. PEET

tribute to the untiring efforts and personal sacrifices of President Stearnes in bringing the association through the reorganization period, but declared the belief of the nominating committee that it would be necessary to choose a 1918 executive from New York City, the center of activity of other branches of the electrical industry with which the contractors will have to work. The nominations of the committee were:

President, W. C. Peet, New York; treasurer, Earnest McCleary, Detroit; secretary, Harry C. Brown. These officers were unanimously elected later.

On motion of Fred Adams, St. Louis, it was voted to move the association offices temporarily to New York in order that the president and secretary might work to closer advantage during the organization period. Authority was also given to hire an assistant secretary to handle routine work, leaving Secretary Brown free for broader executive duties in initiating a great membership campaign.

At the banquet tendered the executive committee by the St. Louis contractors J. A. Fowler acted as toastmaster, and there were addresses by W. L. Goodwin, James R. Strong, Earnest McCleary, Robley S. Stearnes and Chairman-elect W. C. Peet.

W. Creighton Peet, the new national chairman, is a well-known electrical contracting engineer of New York City. Born in New Orleans in 1871, he was educated at the Massachusetts Institute of Technology, later taking diplomas from Heidelberg and Darmstadt. He carried on engineering work for Schuckert & Company, Nuremberg, and, returning to America, joined the engineering staff of the American Telephone & Telegraph Company. Later, with Mr. Powers, he formed the electrical contracting firm of Peet & Powers, which handles large electrical construction work. Mr. Peet is also treasurer of the Conference Club and of the Institute of Electrical Contractors of New York City and has been the representative of the National Contractors' Association on the National Electrical Code committee.

WORK OF MANUFACTURERS OF WIRE AND CABLE IN WAR

Co-operating to the Fullest Degree to Meet the War Requirements of the National Government in Quick Time

A dinner-meeting of the wire and cable manufacturers who are co-operating in war service work for the government was held at the Yale Club, New York, on Jan. 17. Sixty-two men were present. The list of companies represented comprised forty-six properties in different parts of the country, and all are available for work for the government in prosecuting the war.

The large movement to further the war which culminated in this meeting had its beginning with the organization of the wire and cable committee as an outgrowth of the Wire and Cable Section of the Associated Manufacturers of Electrical Supplies. Le Roy Clark, Safety Insulated Wire & Cable Company, who presided at the meeting on Jan. 17, is the chairman of the Wire and Cable Section of the Associated Manufacturers of Electrical Supplies and became in turn the chairman of the wire and cable committee and then of the wire and cable group which has now been formed in connection with the General War Service Committee of the Electrical Manufacturing Industry.

The organization which is now being carried intensively into every branch of the electrical manufacturing industry will, it is hoped, include all manufacturers without regard to whether or not they are members of the associations in the industry.

Mr. Clark explained the purpose of the organization to serve the government by providing necessary manufacturing capacity to meet requirements of the federal authorities in the quickest possible time. Complete co-ordination and patriotic co-operation are yielding the results desired by the Washington authorities. The wire and cable group has already been instrumental in supplying millions of feet of the various kinds of cable and wire requested by the government.

Robert K. Sheppard, Simplex Wire & Cable Company, chairman of the General War Service Committee of the Electrical Manufacturing Industry, made a stirring patriotic address and showed clearly how the organization of manufacturers in the national interest is an effective and necessary part in the prosecution of the war to a successful peace.

Thorough sympathy with the objects outlined was expressed by others present.

General Compliance with Garfield Order

Regulation Designed to Relieve Railroad Congestion Causes Sharp Curtailment of Power Consumption and Some Saving of Fuel—Reports from Central Stations Show Necessity of Drastic Action in Some Cases

LACK of co-ordination in the work of the Fuel Administration and of the Director General of the Railroads has made it impossible to realize great saving from the order of Dr. Garfield.

It develops from interviews with the Fuel Administration that the chief purpose of the order was to relieve congestion on the railroads. Industries supplied with electrical energy generated from water power were shut down for the purpose of curtailing production which might add to the already serious freight congestion. Yet freight kept piling up from points west of the Mississippi, so that the congestion at this writing is as bad as ever. While it is true that shipping in New York Harbor received some coal, the scarcity because of lack of motive power on the part of the railroads coupled with adverse weather conditions is more acute.

At the end of the five-day restriction period no official could say on Wednesday just what were the effects of the industrial shutdown except that it had got coal to seaboard for ships. On Tuesday night the Fuel Administrator requested an embargo on all freight except food and fuel for the remainder of the week so as to obtain the maximum good from his previous order, and on Wednesday Director McAdoo issued the following statement:

On account of the extremely severe weather, which has particularly affected operations of railroads crossing the Alleghany Mountains, Director General McAdoo, upon the recommendation of Regional Director Smith, has authorized him to place an embargo upon all freight except food, fuel and such war munitions and war supplies as are specifically approved by the War Department upon the Pennsylvania Lines east of Pittsburgh, the Baltimore & Ohio east of the Ohio River, and the Philadelphia & Reading, for the purpose of enabling these lines, which are the heaviest bituminous coal carriers, to continue specializing upon coal for the double purpose of supplying the acute conditions in New England and the harbor of New York and elsewhere and in the provision of empty cars for mines and coke ovens. This embargo is a temporary one. It should last but a few days if the weather moderates.

It will be noted that the length of time the embargo is to be in force is indefinite, depending on the weather.

Reports to the ELECTRICAL WORLD from different parts of the country show that the percentage of curtailment in power consumption varied widely in individual properties. In many cases the sharp reduction on the first day was modified on succeeding days as more and more industries were exempt. The effect of the order was to bring relief to various central stations in which drastic action had become necessary.

Many electrical manufacturing companies engaged in war work were exempt in whole or in part.

The reports to the ELECTRICAL WORLD of central station conditions follow:

APPALACHIAN POWER COMPANY

The effect of the order of the Fuel Administration is to reduce our output approximately 20 per cent. The reason that we are not more affected by the order is that the

majority of our load is consumed in the mining of coal, the mines, of course, being operated as near full capacity as possible in so far as the labor and car supply will permit.

HYDRAULIC POWER COMPANY, NIAGARA FALLS

Practically all Niagara Falls plants are operated entirely by hydroelectric power, except a few that use coal for purposes of drying product, and it is apparent that continuous twenty-four-hour operation of plants on water-power systems will aid conservation of coal.

Our estimate of work shut down here on account of the Fuel Administrator's order is not in excess of 10 per cent.

We believe this to be a grand and absolute demonstration of the superiority of hydroelectric power over coal power in that it does not make demands on the transportation systems of the country in times of crises similar to the present one.

PENNSYLVANIA WATER & POWER COMPANY, BALTIMORE, MD.

The Pennsylvania Water & Power Company, being engaged only in the generation and high-tension transmission of hydroelectric energy, is not affected, as an operating company proper, by the recent order of the Fuel Administrator.

The Pennsylvania Water & Power Company supplies through independent local distribution companies the larger portion of the electric railway, lighting and power requirements of the cities of Baltimore, Md., and Lancaster, Pa., and their vicinities. The remaining portion of the Baltimore load requirements, which is supplied by steam, comes within the scope of the Fuel Administrator's order.

Present indications are that the power reduction of the combined system is approximately 15 per cent during the day. We expect that the cities of Baltimore and Lancaster, being two of the few cities in the East connected with a large hydroelectric system, will continue to be much less affected by present or future orders for restriction.

NIAGARA FALLS POWER COMPANY

Practically all of our output is delivered to public utilities and to electrochemical and electrometallurgical industries operating continuous processes, whose plants or their contents would be damaged by shutting down. We understand that customers are observing the Fuel Administration order and are either discontinuing or curtailing to the lowest limit the use of fuel for heating and other incidental purposes. The demand for our output is so great that any power whose use is discontinued is immediately taken up elsewhere. The order, therefore, has no effect on the quantity of our output, although it may have a very slight effect on the distribution thereof.

TENNESSEE POWER COMPANY

There are quite a number of textile mills operated by our power. These mills require heat for dyeing stock and for heating buildings. Some of them have shut down. Others are burning wood for such heat under temporary authority of the State Fuel Administrator; others are heating their building to approximately 40 deg. in order to avoid freezing, as permitted by general order, and allowing help to work or not as they see fit at this temperature.

Foundries are practically out of business, and other manufacturing is either partially running or wholly shut down, so that it is utterly impossible for us to make any intelligent estimate as to the effect on our system. We, of course, expect a considerable reduction in load during both the five-day and the ten Monday periods, but it is impossible to tell what this will be.

DETROIT EDISON COMPANY

Effect of the Fuel Administration order is to cut our daily output approximately 500,000 kw.-hr., or say 23 per

nt of output on week days except Saturdays. Fuel saving approximately 500 tons per day.

DAYTON (OHIO) POWER & LIGHT COMPANY

Effect of Fuel Administrator's order reduced load on generating stations approximately 60 per cent on Friday and Saturday, with slightly increased load on Monday.

CLEVELAND ELECTRIC ILLUMINATING COMPANY

Situation from our standpoint demanded drastic action. First day's order reduced load 50 per cent.

ROCHESTER RAILWAY & LIGHT COMPANY

As a result of the fuel order we are saving about 250 tons of steam coal per day in our electric plant and approximately 50 tons of coal and 2500 gal. of oil in our gas plant. The order is being lived up to in a way which is commend-

factories that formerly used electric power were not running.

MILWAUKEE ELECTRIC RAILWAY & LIGHT CO.

The order of the Fuel Administrator has caused a reduction in our power load of approximately two-thirds, but has had no noticeable effect on our lighting load. Reduction in railway load is very small. The operation of the order will cause a substantial decrease in gross revenues, with the only offsetting reduction in operating expenses represented by coal equivalent to the kilowatt-hours saved. The effect on net income will be serious. Measured in this way, the cost of saving the coal will exceed its value.

EDISON LIGHT & POWER COMPANY, YORK, PA.

There was a marked decrease in our output for the five days, and particularly on Monday. During the period we were able to operate on water power entirely, the only fuel used being that required for our steam-heating system. We have not benefited in the distribution of coal, but hope that the effect of the order in partially relieving the railroad congestion will result in a general improvement and at least prevent a complete tie-up.

WHEELING (W. VA.) ELECTRIC COMPANY

We will naturally suffer some loss of revenue, but as fuel conditions were getting desperate (in fact, we were anticipating daily the necessity of cutting off our power customers) the order worked to our advantage, permitting the storage of some fuel, which has not been done for two months, our storage being completely exhausted.

A number of our large power customers were permitted to operate, and in addition to these we are furnishing power for thirty coal mines, which, of course, are working.

Our power load loss for the days affected by the order will be about 50 per cent, but in the end we estimate that the loss will not be nearly so large because we believe the railroad situation will be relieved, permitting a number of our works to operate full, while at present some of them are closed down and others are working part time on account of their inability to get raw material in and finished products out.

The coal mines we are supplying power to are located in Ohio, which accounts for the difficulty of getting fuel from them. We do not have a shortage of fuel mined in this vicinity. The railroad sidings are full of coal. Hundreds of cars can be found on the railroad sidings that have not been moved for days and in some cases weeks.

American Citizens Will Obey the Order

Because hospitals, charitable institutions, municipal lighting, etc., are not affected by this order, gas, electricity and steam will be on our lines as heretofore. If you are in doubt as to how the order affects your business, phone "Bell, Main 3060, or Home, Stone 3060" and ask for any of the following representatives of this company:

R. M. SEARLE	E. L. WILDER
J. T. HUTCHINGS	J. P. MacSWEENEY
H. RUSSELL	E. C. SCOBELL
T. H. YAWGER	F. W. FISHER
I. LUNDGAARD	C. A. TUCKER
	C. G. DURFEE

Any of these men will gladly conserve your time by securing for you a ruling from the local fuel administrator.

Orders for the shutting off of light, heat or or power resulting from failure to obey the new order will be executed promptly by this Company.

Our Attitude

The order has been issued to relieve present suffering and prevent still greater distress. These conditions have been brought about by the war which must be won.

The order means financial loss to all—This is our opportunity to prove that we are first of all American Citizens.

Let's Do Our Duty Cheerfully

HOW THE ROCHESTER COMPANY TOLD THE PUBLIC

able to the citizens of Rochester and, if the people of this city represent the nation, the spirit manifested can mean but one thing, and that is that the war will be won.

We believe that the relief to the railroads will do much to help clear up transportation difficulties.

MAHONING & SHENANGO LIGHT & RAILWAY COMPANY, YOUNGSTOWN, OHIO

On Friday output was reduced 105,000 kw.-hr., or 19 per cent; load reduced 6800 kw.-hr., or 23 per cent. On Saturday output reduced 94,000 kw.-hr., or 19 per cent; load reduced 5400 kw.-hr., or 19.6 per cent.

ROCKFORD (ILL.) ELECTRIC COMPANY

The effect of the Fuel Administrator's order has been that we are reduced to 40 per cent of our normal load; also that window and sign lighting has been discontinued to even a greater extent than that required by the Garfield order.

People here are intensely patriotic and wish to aid the government in its conservation of fuel.

LOUISVILLE GAS & ELECTRIC COMPANY

On Friday, Jan. 18, the output of electricity from our plant was 169,500 kw.-hr. against 219,000 kw.-hr. for an ordinary day. The peak load was 14,800 kw.-hr. against 16,000 kw.-hr. for an ordinary day. The loss in output was almost entirely confined to the daytime hours, when the

Sharp Curtailment in Output in New England

Many New England central stations lost one-half to three-quarters of their day loads during the period covered by the Garfield order, but the situation improved as exemptions were announced in Washington. It is estimated that 1,200,000 factory workers were idle on Friday, but there was patriotic compliance with the order despite hardships. The amount of wages lost in thirteen idle days is estimated at \$38,000,000.

The peak load of the New England Power Company fell from 65,000 kw. to 25,000 kw. The company wasted no water and its reservoir system proved most valuable. This company expects that its load will increase on future Mondays through the exemption of war industries from the operation of the order.

The Turners Falls Power Company and other hydro-electric companies were authorized by the State Fuel Administrator to supply customers with water power.

It is understood that the effect of the order was not disastrous in the territory of the Edison Electric Illuminating Company of Boston.

There was a substantial reduction of load at Providence. The interconnection with the New England Power Company's system proved most valuable.

The Cumberland County Power & Light Company,

Portland, Me., met the load entirely with water power. Its output fell from 10,500 kw. to 8500 kw. The company shut down its two 1000-kw. steam plants, which burned 70 tons daily, and purchased 2000 kw. from hydroelectric plants of the S. D. Warren Paper Company, Westbrook.

The Cambridge (Mass.) Electric Light Company lost one-half of its load, but some exemptions increased consumption on Monday. The local Fuel Administrator has ordered a moonlight street-lighting schedule.

The Manchester (N. H.) Traction, Light & Power Company lost about one-quarter of its power load, saving about 60 tons of coal per day.

The New Bedford (Mass.) Gas & Edison Light Company was affected materially. Its output on Thursday, Jan. 17, was 207,971 kw.-hr. On the Friday following it was 63,273 kw.-hr. The peak loads were respectively 15,500 kw. and 4700 kw. The coal consumption of this company was 183 tons Thursday and 82 tons Friday.

The Worcester (Mass.) Electric Light Company load fell from 11,000 kw. to 2700 kw., and the consumption of coal decreased from 225 tons to 62 tons. Through exemptions 1000 kw. was added on Monday.

The day load of the Fall River (Mass.) Electric Light Company dropped from 6500 kw. to 700 kw. The output on Thursday was 112,300 kw.-hr. and on Friday 36,000 kw.-hr. The consumption of coal was 108 tons on Thursday and 50½ tons on Friday. The relative consumption per kilowatt-hour was 2.16 lb. on Thursday and 3.14 lb. on Friday. The night peaks were respectively 7700 kw. and 2650 kw.

The load of the United Electric Light Company, Springfield, Mass., fell from 12,000 kw. to 3000 kw. on account of heavy decreases in consumption by merchants and manufacturers. The company saved 100 tons of coal daily, and it has begun to discharge employees as a measure of economy.

The load of the Fitchburg (Mass.) Gas & Electric Light Company fell from 2500 kw. to 400 kw. Exemptions soon increased the latter to 600 kw. The New England Power Company supplied the entire Fitchburg load during curtailment.

The Lowell (Mass.) Electric Light Corporation and the Edison Electric Illuminating Company of Brockton, Mass., operated by Stone & Webster, lost in power loads, but munition plants lessened the reduction at Lowell. The Brockton load fell from 8500 kw. to 1200 kw. despite the army shoe contracts of local factories.

Maine utilities suffered less than other localities because of the available water power.

The Lynn (Mass.) factory of the General Electric Company was exempted; also the Terry Steam Turbine Company factory at Hartford, Conn.

The Hartford Electric Light Company load fell from 23,000 kw. to 10,000 kw. Two-thirds of the factories at Bristol, Conn., are operated by hydroelectric power from Falls Village, and it is expected that they will be operated on future Mondays. A similar hope is expressed in Willimantic, Conn.

The Salem (Mass.) Electric Lighting Company day load fell from 7500 kw. to 2000 kw. The Malden (Mass.) Electric Company plant was shut down for five days, and necessary requirements were supplied from Salem through a tie line. The total saving at Salem was about 35 tons per day; normal consumption is 85 tons; daily output dropped 50 per cent at Salem.

Effect of Order in Chicago and Central West

The central-station industry of the Middle West is in hearty accord with the Fuel Administrator's recent order. The necessity of such drastic action is appreciated fully.

The situation in the larger centers, Cleveland and Chicago in particular, had reached a stage where it was only a question of whether the industrial shutdown would be made in an organized manner or whether it would be made in individual cases as the absolute necessity became apparent. Since the latter method was open to so much chance for discriminatory practice the adoption of the former plan is hailed with satisfaction.

There is little sympathy, however, with the policy which permitted the country's fuel supply to get into its present state. Criticism of the Fuel Administration from that angle is heard regularly from central-station sources; but now that the situation exists the present method of solution is viewed as the best way out of a bad fix.

The cause of the situation, as seen by central-station executives of the Middle West, is almost wholly one of transportation. Had the public been made to realize ten years ago that a starvation system of revenue for the railroads would react against the national good ultimately, such a calamity as this fuel crisis could not have occurred. Furthermore, all during last summer the public was led to believe that coal would be cheaper in the fall so that many coal consumers put off purchases. It is believed that the government should have urged people to buy coal early in the summer and have shown that prices would probably go up.

The effect of the order on central-station outputs and revenues will not be so great as might be expected at first. Data which have been worked out show that heatless Monday is a better central-station day than any typical Sunday. The belief is expressed that the total effect of the Garfield order will be less than a 3 per cent reduction in output for January for a large Middle Western company.

WAR SERVICE WORK OF THE UTILITIES COMMITTEE

National Committee on Gas and Electric Service on
Duty in Co-ordinating Work of Utilities
with Government War Needs

The National Committee on Gas and Electric Service, of which John W. Lieb is chairman, has issued a report of its current activities. This committee is rendering a service in co-ordinating the work of electric and gas utilities with war needs. In part the report says:

This committee has placed at the disposal of the Fuel Administration two representatives who have their offices continuously in that bureau to handle the complaints of the public utilities and endeavor to obtain such relief as may be possible.

The Fuel Administration has recently added to its staff a public utility representative in the conservation department of that bureau, whose particular duties shall be to work out as much as possible the conservation of fuel in the operation of public utilities.

Another member has been added to the National Committee on Gas and Electric Service in the person of H. G. Bradlee of Stone & Webster. Mr. Bradlee, as is well known, brings to the committee a vast knowledge and experience along public utility lines.

TEXT OF THE REGULATION TO PROVIDE FUEL SUPPLY

A More Adequate Supply for Railroads, Domestic Consumers, Public Utilities and Other Uses Necessary to National Security

Following is the full text of the regulation of Dr. H. A. Garfield, United States Fuel Administrator, issued Jan. 17:

The United States Fuel Administrator, acting under the authority of an executive order of the President of the United States dated Aug. 23, 1917, appointing said administrator, in furtherance of the purposes of said order and of the purposes of the act of Congress therein referred to, approved Aug. 10, 1917, and finding it essential effectively to carry out the provisions of this act to make provision for a more adequate supply of fuel for railroads, domestic consumers, public utilities and for other uses necessary to the national security in certain parts of the United States, hereby makes and prescribes the following regulation:

Section I.—Until further order of the United States Fuel Administrator, all persons selling fuel in whatever capacity shall, in filling their contracts or orders now on hand, give preference to necessary current requirements of railroads, domestic consumers, hospitals, charitable institutions, army and navy cantonments, public utilities, by-product coke plants supplying gas for household use, telephone and telegraph plants, shipping for bunker purposes, the United States for strictly governmental purposes (not including factories or plants working on contracts for the United States), manufacturers of perishable food or of food for necessary immediate consumption, and municipal, county, or state governments for necessary public uses. Any tonnage remaining after the foregoing preferred shipments have been made may be applied in filling any other contracts or orders.

Section II.—On the following days, namely, Jan. 18, 19, 20, 21 and 22, 1918, the state fuel administrators and their accredited representatives in the various communities in the territory in which this regulation applies are hereby empowered and directed to divert such fuel as arrives in such communities in carload lots to meet the current requirements, and to provide an adequate and normal supply for such consumers of fuel as are specified in Section I hereof.

Section III.—On the following days, namely, Jan. 18, 19, 20, 21 and 22, 1918, and, also, on each and every Monday beginning Jan. 28, 1918, and continuing up to and including March 25, 1918, no manufacturer or manufacturing plant shall burn fuel or use power derived from fuel for any purpose, with the following exceptions:

(a) Plants which necessarily must be continuously operated seven days each week to avoid serious injury to the plant itself or its contents may use only such quantity of fuel as is necessary to prevent such injury to the plant or its contents.

(b) Manufacturers or plants manufacturing perishable foods or foods for necessary immediate consumption.

(c) Manufacturers of food not perishable and not necessary for immediate consumption may burn fuel to the extent authorized by the Fuel Administrator of the State in which such plant is located or by his duly authorized representative upon application by the United States Food Administrator.

(d) Plants necessary to the printing and publication of daily papers may burn fuel or use power derived therefrom as usual, except that on every Monday from Jan. 21 to March 25, 1918, inclusive, they may burn fuel or use power derived therefrom only to such extent as is necessary to print and publish such editions as such plants customarily print and publish on legal holidays other than the Sabbath; or, if such plants do not customarily print or publish any editions on such legal holidays, they may burn fuel or use such power to such extent as is necessary to issue one edition on the said Mondays.

(e) Printing establishments may burn fuel on Jan. 18, 19, 20, 21 and 22, 1918, to such extent as is necessary to issue current numbers of magazines and other publications periodically issued.

Section IV.—On each Monday beginning Jan. 21, 1918, and continuing up to and including Monday, March 25, 1918, no fuel shall be burned (except to such extent as is essential to prevent injury to property from freezing) for the purpose of supplying heat for:

(a) Any business or professional offices, except offices used by the United States, state, county or municipal governments, transportation companies, public utility companies, telephone or telegraph companies, banks, trust companies, physicians or dentists.

(b) Wholesale or retail stores, or any other stores, business houses or business buildings whatever, except that for the purpose of selling food only stores may maintain necessary heat on any of the specified days until 12 o'clock noon, and except that for the purpose of selling drugs and medical supplies only stores may maintain necessary heat throughout the day and evening.

(c) Theaters, moving-picture houses, bowling alleys, billiard rooms, private or public dance halls, or any other place of public amusement.

Section V.—On each Monday beginning Jan. 28, 1918, and continuing up to and including March 25, 1918, no fuel shall be burned for the purpose of heating rooms in which intoxicating liquor is sold or served on those days.

Nothing in this regulation shall be construed to forbid the heating of restaurants, hotels or other places in which meals are served but in which no intoxicating liquor is sold or served on the said Mondays.

Section VI.—No fuel shall be burned on any of the Mondays specified in the foregoing section for the purpose of supplying power for the movement of surface, elevated, subway or suburban cars or trains in excess of the amount used on the Sunday previous thereto.

Section VII.—Nothing in this regulation shall be construed to apply to or affect the operation of any mine or plant producing fuel, nor shall this regulation be construed to forbid the heating of such rooms or offices or such portions of buildings as are used in connection with the production, transportation or distribution of fuel.

Section VIII.—State fuel administrators and their representatives specifically authorized so to do are hereby empowered to grant such relief as may be essential to prevent injury to health or to prevent destruction of or injury to property by fire or freezing.

Section IX.—This regulation is effective throughout the United States east of the Mississippi River, including the whole of the States of Louisiana and Minnesota.

Section X.—Any person, firm, association or corporation which violates or refuses to conform to the above regulation may be liable to the penalty prescribed in the aforesaid act of Congress.

REASONS FOR THE ORDER

In explanation of his order, Dr. Garfield issued the statement given in part below:

The most urgent thing to be done is to send to the American forces abroad and to the Allies the food and war supplies which they vitally need. War munitions, food, manufactured articles of every description, lie at our Atlantic ports in tens of thousands of tons, while literally hundreds of ships, waiting loaded with war goods for our men and the Allies, cannot take the seas because their bunkers are empty of coal. The coal to send them on their way is waiting behind the congested freight that has jammed all terminals.

It is worse than useless to bend our energies to more manufacturing when what we have already manufactured lies at tidewater, congesting terminal facilities, jamming the railroad yards and sidetracks for long distances back into the country. No power on earth can move this freight into the war zone where it is needed until we supply the ships with fuel.

More than a shock was needed to make a way through that congestion at the terminals and on the docks so that the aid so vitally needed by the Allies could get through.

The incidental effect of this transportation situation on coal production has been disastrous. There is and always has been plenty of fuel, but it cannot be moved to those places where it is so badly needed while railroad lines and terminals are choked.

LARGE CALIFORNIA SYSTEMS

UNITE FOR PERIOD OF WAR

As War Measure to Economize Fuel Four Great Companies Agree to Joint Operation—Total Capacity 377,600 Kw.

For the period of the war and in the interest of fuel economy the Pacific Gas & Electric Company, the Great Western Power Company, the Sierra & San Francisco Power Company and the Universal Electric & Gas Company have agreed to operate their systems under one management. P. M. Downing, chief engineer Pacific Gas & Electric Company, electrical department, will have charge of the jointly operated systems.

Under this plan several standby plants can be shut down without endangering continuity of service as provided by the joined systems. By operating only those centrally located standby plants whose efficiency is highest a great saving of fuel oil will be effected and loads will be distributed so that water storage on each system can be used to maximum advantage.

This action was taken after joint conferences with State Fuel Administrator Schwabacher and the California Railroad Commission, and it is a development which followed the detailed consideration of the interconnection of transmission systems, a report of which appears following this article. The power companies have announced that the unified service will be continued as long after the war as such action may be deemed in the interest of the public. The combined systems serve about 40,000 square miles, believed to be the largest area yet administered by a single management. The total generating capacity of the combined system at present is about 377,600 kw., of which 240,000 kw. is hydroelectric power and the remainder steam.

A careful observer of California conditions makes the following comment to the ELECTRICAL WORLD on the new arrangement:

The consolidation of central California power systems for joint operation as a war measure is one of the long strides forward which are made from time to time in the West. It is not often, however, that so important a move is made literally overnight or is launched without precedent largely on faith that all concerned will do their part fairly. Much credit is due the several companies for the spirit shown in joining competitors without hesitation or limitation. The redistribution of load, it is understood, is to be made by one man, Mr. Downing, without let or hindrance, the determining factor always being the efficiency of the several systems considered as one unit and the minimum consumption of fuel.

Even if the attitude of the competing companies had been such that this move might have been made before, it would not have been feasible because the public would have resented and opposed it with all the vigor of the sentiment against trusts, but now in the emergency of war and facing fuel famine the economies of monopoly in public utility management have not only become apparent to the man in the street but are being urged on the companies themselves as patriotic duties.

One of the most important features of the move and one which there has not yet been time to work out in detail is the apportionment of income under the combined plan of operation. However, with all concerned in a co-operative rather than a competitive attitude, it will be simply a matter of agreeing upon that plan which seems fairest to all. With the rainfall in California thus far the least in sixty-nine years, a plan which contemplates utilizing water storage more efficiently cannot impair the interests of stockholders. No man could be found who has better qualifications than Mr. Downing as "power dictator" for the California systems.

Not only does his experience eminently qualify him to handle the complex problems of this work but he has the complete confidence of the several companies involved. The success of the plan under his administration may well establish a precedent that will be far-reaching in effect.

ADVANTAGES OF TYING IN THE CALIFORNIA SYSTEMS

Costs of Interconnection and Attendant Fuel Saving
Discussed by Representatives of the Companies
and Railroad Commission

A hearing was held by the California Railroad Commission on Jan. 14 to discuss with representatives of the various power companies ways and means for combining transmission lines and otherwise co-operating to reduce fuel consumption. The commission engineering department filed a preliminary careful study of interconnection possibilities. In this it was pointed out that the immediate requirements for 1918 of the four chief power companies supplying the San Francisco Bay region call for an increase of more than 200,000,000 kw.-hr. of energy and more than 50,000 kw. peak capacity, as compared with 1917.

There is a marked diversity between the several generating systems, the report stated, especially in low-water seasons, which can be employed to advantage to offset part of the increased demand. But in any event the concentration of load and rapid growth in the San Francisco Bay region necessitate an increase in transmission facilities. The present lines for bringing power into San Francisco are entirely inadequate, resulting in the unnecessary use of steam-produced energy and preventing what would otherwise be a saving in fuel oil. In fact, the future growth in power requirements of the companies operating in the bay region, the report stated, will necessitate expenditure of over \$5,000,000 annually by utilities to provide generating plants and transmission lines alone to meet the demand.

A large amount of unused hydroelectric power in northern California is practically ready to be marketed. Additional transmission lines must be built and existing lines reinforced to make this supply available at consumption points. If present methods of separate operation are allowed to continue, increased demand can be supplied only by steam-produced energy. This will require more than 1,000,000 bbl. of oil per annum more than is now consumed. If interconnections are made and power available in the north be added to the transmission network, saving at the rate of over \$200,000 per year in fuel oil, the report stated, can be begun at once.

The commission engineers stated that committees from each of the two natural divisions in the State have been appointed to co-operate in working out details of interconnection as follows:

Northern division: John A. Britton, Pacific Gas & Electric Company; Mortimer Fleischhacker and H. F. Jackson, Great Western Power Company; W. F. Detert, Northern California Power Company; J. D. McKee, California-Oregon Power Company; Samuel Kahn, Western States Gas & Electric Company; A. G. Wishon, San Joaquin Light & Power Company.

Southern division: R. H. Ballard, Southern California Edison Company; William Baurhyte, Los Angeles Gas & Electric Company; A. B. West, Southern Sierras Power Company; H. H. Jones, San Diego Consolidated Gas & Electric

pany; A. G. Wishon, San Joaquin Light & Power Company.

Reporting for the northern committee, H. F. Jackson said that careful consideration had been given to the possibilities of interconnecting the Northern California and California-Oregon transmission systems with the Pacific Gas & Electric, thereby bringing these companies into the northern division network. This interconnection would involve construction of two tie lines and an additional circuit on the present power line from Nicolaus to Cordelia. This construction would cost about \$1,700,000, he thought.

In considering additional power available for the northern division, it was pointed out that extension of the Drum development could add 12,500 kw. to the network. The Great Western Power Company reported 9,000 kw. additional power available for development and the Sierra Company has about 9000 kw. which could be developed economically. Committees were appointed to report on these connecting lines and the increased power possibilities.

Mortimer Fleishhacker foresaw considerable difficulty in raising the money necessary to carry out interconnection on a satisfactory scale. Most companies are hard pressed to secure money necessary even for routine operation, and with all costs increasing and rates stationary it would be practically impossible to induce capital to put money into power company extensions at present. Earning capacity of Pacific Coast companies has fallen off and stocks and other securities have decreased in value accordingly. He failed recently to raise funds in Eastern centers for extending the Great Western system because the profit was not sufficient to interest new investors. However, if rates were increased present stockholders could probably be induced to improve their investment by some further advancement of capital.

As a war measure Mr. Fleishhacker urged that something should be done to enable companies to finance hydroelectric development. Two or three shipyards are being constructed and other extensive industrial load is coming in the bay region. Meanwhile, power companies have stopped generating-plant extensions because of labor and material prices. With the rainfall thus far recorded this year the lowest in sixty-nine years, he predicted inevitable power shortage next season because of lack of stored water.

P. M. Downing, chief engineer Pacific Gas & Electric Company, classified the northern division interconnection problems under two heads—first, effectively bringing together three large companies for off-peak load, and, second, the best means of getting the Northern California and the California-Oregon systems economically tied in to the central network. An inexpensive solution of the first of these would be to tie the Great Western and the Sierra systems together indirectly, using Pacific Gas & Electric lines as the connecting link. He did not think sufficient energy would be transferred over a direct connection to effect an oil saving that would justify the cost of making the direct tie-in. As to getting power from the northern systems into the central group, he thought it would be necessary to construct several hundred miles of transmission line, bringing this power, approximately 12,500 kw., down to the Cordelia substation. This amount of power, on the basis of 200 kw.-hr. per barrel of oil, would be the

equivalent of 420,000 bbl. of oil, or a saving of \$500,000 per year. Cost of the transmission lines necessary to effect this tie-in would be about \$1,500,000.

R. H. Ballard, general manager Southern California Edison Company, submitted a written report for the committee which has been studying conditions in the South. He pointed out that the southern section is already well interconnected and that the next move should be development of more water power to reduce present oil consumption in auxiliary and standby plants. About \$600,000 per year, he thought, is the saving now secured as the direct result of interconnecting systems, and he expressed firm conviction that saving could be made in any part of the country where interconnection was at all feasible.

E. F. Scattergood, chief electrical engineer Los Angeles power bureau, presented a plan for decreasing oil consumption in that city, as part of the movement for conservation.

In closing the hearing, Commissioner Devlin said that he foresaw the possibility of great saving of fuel as a result of the action that could probably be taken and set Jan. 31 as the date for hearing sub-committee reports.

WATER-POWER BILL STEPS TAKEN IN WASHINGTON

Lower House of Congress Appoints Committee
Which Will Report on Administration Bill—
Senate May Stand by Shields Bill

The House of Representatives on Jan. 11 took the first step toward passing the new administration water-power bill expeditiously by adopting a resolution providing for appointment of a special committee to which all bills and resolutions introduced during the Sixty-fifth Congress, except those touching foreign affairs, which deal with water-power matters shall be referred.

The resolution adopted by the House discharges from further consideration the various bills on water power of the committee on interstate and foreign commerce and the committee on public lands, which have been before the House for some years, and the old bills are to go to the new committee.

The resolution in excepting bills and resolutions touching foreign affairs leaves in the hands of the House foreign affairs committee proposed legislation in regard to Niagara Falls water power.

Senators are studying the administration water-power bill. The Washington correspondent of the ELECTRICAL WORLD reports ground for the belief that those who feel that legislation of some definite character should be enacted at the present session would do well if they sent their views on the new bill to Senators immediately.

The fate of the new bill, so far as the Senate is concerned, is now hanging in the balance in that body. The long delays and wide differences of opinion which have prevented water-power development may continue, and there may be no legislation at the present session unless Senators can be made to see that agreement is necessary. It is still understood in Washington that President Wilson intends to have conferences with Senators as he had with House members, and he may persuade Senators to look upon the bill favorably.

But Senator Shields of Tennessee, who led the forces

which passed the Shields bill in the Senate, has pointed out to the Washington correspondent of the *ELECTRICAL WORLD* that the Shields bill as passed by the Senate was a compromise measure, and he said further that twenty Senators not present when the vote was taken would have voted for the Shields bill, he was informed, if they had been present. The Senate will not lightly rescind the stand it took when it passed the Shields bill as a compromise.

REORGANIZATION PLAN OF THE ORDNANCE DIVISION

Guy E. Tripp, Chairman of the Westinghouse Company, Among Those Who Serve as Civilian Heads of Divisions

General Wheeler, acting chief of ordnance, War Department, has announced the appointment of a number of civilians as heads of new divisions in the ordnance branch of the department, in addition to Samuel McRoberts, formerly executive manager of the National City Bank of New York, in charge of procurement work.

Guy E. Tripp, formerly chairman of the board of the Westinghouse Electric & Manufacturing Company, who has been given leave of absence by the directors of that company for the period of the war; Charles N. Black, engineer, of New York, and Ralph Crews, lawyer, of Chicago, whose practice in business has been of a large character, will join General Wheeler's staff as civilian

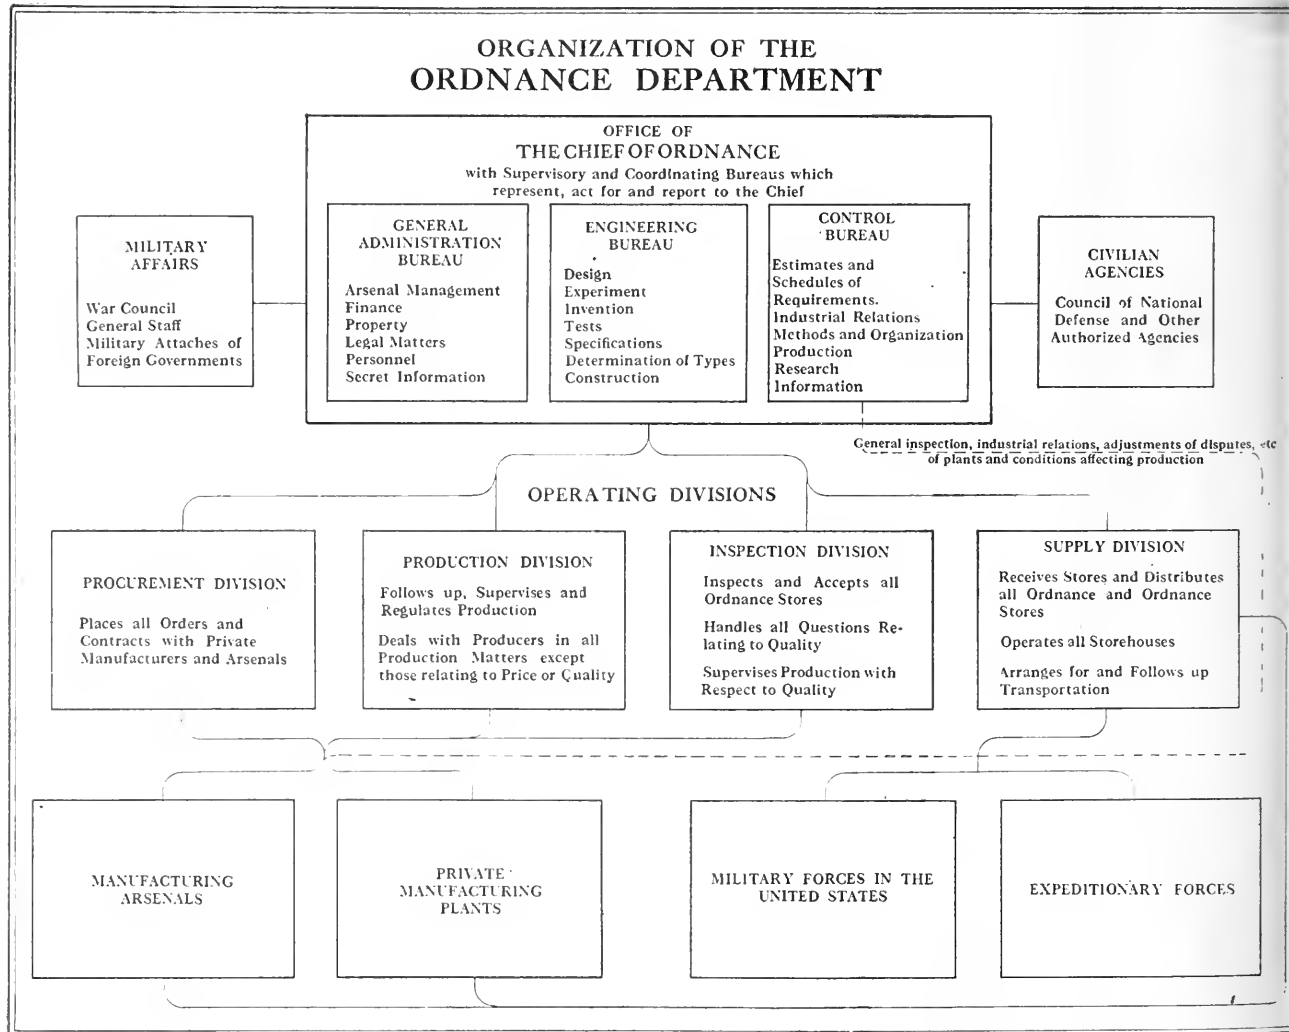

heads of divisions. Mr. McRoberts will be in charge of procurement work, but it is stated in Washington that the exact work to be done by the other civilians is not yet settled.

The ordnance division of the War Department has been reorganized by the creation under the chief of general administration bureau, an engineering bureau and a control bureau. Under these are a procurement division, a production division, an inspection division and a supply division.

The general administration bureau will deal with arsenal management, finance, property, legal matter personnel and secret information. The engineering bureau will deal with design, experiment, invention tests, specifications, determination of types and construction. The control bureau will deal with estimates and schedules of requirements, industrial relations methods and organization, production, research and information of a general character.

In the operating line the procurement division will deal with the placing of all orders and contracts with private manufacturers and arsenals; the production division with following up, supervision and regulation of production and with producers in all production matters except those relating to price or quality; the inspection division with inspection and acceptance of ordnance stores, and it will also handle all questions relating to quality and will supervise production with respect to quality; the supply division will receive

ORGANIZATION OF THE ORDNANCE DEPARTMENT

stores and distribute all ordnance and ordnance stores, will operate all storehouses and arrange for and follow transportation.

SUCCESSFUL MEETING

HELD AT DAYTON, OHIO

Several Papers Are Presented at Gathering of the Industrial Power and Heating Section, with War in the Foreground

The first meeting of the industrial power and heating section of the new-business co-operations committee of the Ohio Electric Light Association was held in Dayton on Jan. 16 and was attended by about 150 from various parts of Ohio and neighboring States.

Frank B. Steele, power engineer Dayton Power & Light Company and chairman of the section, presided. He referred to the fact that this was the first meeting and that the next meeting of the section would be held in Cleveland in May.

Judge E. P. Matthews, vice-president Dayton Power & Light Company, made the address of welcome. In addition to welcoming the out-of-town men, he referred to the opportunity of the central stations at this time to secure all the power business in their communities. He also spoke of the wonderful development that had been made in the industrial business of Dayton because the Dayton Power & Light Company had been in a position to take care of this business.

Dwight D. Miller, Society for Electrical Development, New York, presented his paper on "Low-Temperature Industrial Heating."

In discussing this paper C. D. Carlson, Cleveland Electric Illuminating Company, referred to conditions in Cleveland and stated that there are approximately forty electric ovens operating in that city at present covering twelve different uses, as follows: Auto parts, stove parts, vacuum cleaners, wooden handles, tools and wrenches, multigraph parts, toys, shrapnel varnish baking, jobbing and armature coil baking, drying lime in wire and metal furniture.

Mr. Carlson stated that every electric oven that had been installed in Cleveland had stayed and that the cost of operating compared very favorably with that of gas. The ovens in Cleveland vary from a capacity of 15 kw. to 212 kw., and the largest installation totals 800 kw. The paper was also discussed by C. I. Crippen of the Mahoning & Shenango Railway & Light Company, Youngstown, Ohio, who stated that malleable iron is being annealed at present in Sharon, Pa.

Following luncheon, George C. Smith, chief of industrial surveys, Baltimore & Ohio Railroad, Baltimore, made an address on "Industrial Surveys for Intensified Service." Mr. Smith told what the railroad company is doing in making surveys of the various cities along its lines and how this information is used, not only in seeing that industries are located most advantageously for them, but also how the entire communities are benefited from the information that the Baltimore & Ohio company obtains through these surveys.

When the convention reconvened in the afternoon J. A. Winder, General Electric Company, Niagara Falls, N. Y., presented an interesting paper on "The Uses of Electricity for the Manufacture of Chemicals." In the discussion Mr. Winder pointed out the necessity for water-power development near the center of the mar-

kets of the United States. He stated that Far Western hydro developments will have little effect on commercial production of electrochemical products. Mr. Winder cautioned central stations against loading their lines with chemical industries which could not withstand competition after the war. The paper was also discussed by W. P. Whittington, Springfield Light, Heat & Power Company, and C. I. Crippen of the Mahoning & Shenango Railway & Light Company, Youngstown.

R. L. Yates, assistant manager Platt Iron Works Company, Dayton, presented his paper on "Water Pumping by Electricity." This paper was discussed by Dwight Miller, Society for Electrical Development, New York; F. H. Hooper, Northwestern Ohio Electric Light & Power Company, Van Wert; W. P. Whittington, Springfield Light, Heat & Power Company; Wirtt S. Scott, commercial heating engineer, Westinghouse Electric & Manufacturing Company, East Pittsburgh, and C. I. Crippen, Mahoning & Shenango Railway & Light Company.

In the evening a banquet was held under the auspices of the Electric Club of Dayton in the Miami Hotel. Frank B. Steele, power engineer Dayton Power & Light Company, acted as chairman and introduced Judge Roland W. Baggott of the Court of Domestic Relations as toastmaster.

Capt. Paul M. Lincoln, consulting engineer Westinghouse Electric & Manufacturing Company, East Pittsburgh, in his address on "The Electrical Industry and the War," said that it was the business of every one connected with the industry to make the utmost effort toward winning the war.

Mayor J. M. Switzer had as his topic "The City and the Public Utilities" and pleaded for frankness on the part of both the city government and utility corporations, suggesting that the utilities frankly discuss the present difficulty with the public through newspaper advertisements. Mayor Switzer held that the Kaiser alone was responsible for the present coal shortage, and therefore the people should bear with the utilities in their effort to serve.

D. L. Gaskill, Greenville, the secretary of the Ohio association, talked along patriotic lines, but made a strong plea for public co-operation with utilities under the present stress and laid emphasis on the great difficulty of public utilities in securing fuel and meeting the extreme high cost of coal and all other commodities.

Charles F. Kettering, president Dayton Engineering Laboratories Company, in his opening remarks paid great tribute to the Dayton Power & Light Company and gave it the credit for solving all the power problems incident to the unusual industrial developments in Dayton.

Lee Warren James, president of the Greater Dayton Association, had as his subject "The Commercial Organizations and Public Utilities," and told how the Greater Dayton Association was endeavoring to co-operate not only with the city government, but also with the public utilities in serving the people of "dominant Dayton."

Edward R. Kelsey, governor of the district for the International Rotary Clubs and director of publicity Toledo Railways & Light Company, brought a message of war service for every electrical man. Mr. Kelsey has just been appointed chairman for Ohio for the "Smile-age" campaign.

Associations and Societies

A complete Directory of Electrical Associations is printed in the first issue of each month on the next-to-last text page.

Western Society of Engineers.—Officers of the electrical section of the Western Society of Engineers were elected at a meeting Jan. 14 as follows: Chairman, E. N. Lake; vice-chairman, J. R. Cravath; members of executive committee, Earnest Lunn and Charles H. Norwood.

Lynn Section, A. I. E. E.—The annual banquet of the Lynn Section, American Institute of Electrical Engineers, will be held this year on Saturday evening, Feb. 2. A number of prominent speakers are being considered for the main feature of the program. Ex-president Charles A. Coffin and President E. Wilbur Rice are to be invited.

Utah Contractors and Dealers Meet.—Members of the Salt Lake district of the Utah Society of Electrical Contractors and Dealers met at the Commercial Club on Jan. 4. Officers for 1918 were elected and the business of last year was reviewed. The new officers are: President, George R. Randall; vice-president, G. W. Forsberg; secretary-treasurer, F. C. Wolters; executive board, E. M. Dobb, R. C. Carter and James Swyers.

San Francisco Electrical Development League.—The league meeting on Jan. 9 was Ladies' Day, and Mrs. Aurelia Reinhart, president of Mills College, talked on "What Women Can Do in the Present Crisis." Mrs. Emerick, a noted lecturer on Mesopotamia, told about recent conditions there. Mrs. Robert Burdette, leader of women's activities in food conservation, spoke on that subject. The chairwoman of the day was Mrs. H. F. Jackson, wife of the president of the Pacific Coast Section, N. E. L. A.

Program of Western Association of Electrical Inspectors.—The program for the "win-the-war" meeting of the Western Association of Electrical Inspectors at Memphis, Tenn., Jan. 29, 30 and 31, has been arranged as follows: Address of welcome, Frank L. Lucas; president's address, Emil Anderson, Milwaukee; "Conservation," James F. Joseph; "Underwriters' Laboratories and the Great War," A. R. Small; address on "Safe Electrical Requirements for Oil Refineries"; general discussion of "The Use of Electricity in Winning the War"; general discussion of "Rational Economies in Grounding," led by Carl K. Chapin, Memphis; address by William F. Dunbar, Atlanta, Ga.; report of the committee on outside wiring by F. W. Derby; report of the committee on show-window and display lighting by F. P. McGough; report of the committee on installation and operation of induction motors by K. W. Adkins; report of the committee on architects' specifications by F. H.

Moore; report of committee on electric traction systems by F. R. Daniel; report of committee on demand factor by Guy W. See. There will also be an open discussion of inspectors' problems.

Meetings of the American Association of Engineers.—On Jan. 14 the Pittsburgh Chapter of the American Association of Engineers held a meeting at the Fort Pitt Hotel, P. B. Waldin, president of the Pittsburgh Branch, addressing the chapter on "Engineering as a Profession." The offices of the chapter are at 1312 Fulton Building. The Cleveland chapter, of which T. J. Brennan, 512 Columbia Building, is chairman, held a meeting on the evening of Jan. 15. The Philadelphia Chapter held a meeting on Jan. 18 at which the general secretary of the association spoke on the "Objects of the American Association of Engineers and the Receiving of Recognition for the Engineering Profession."

Cincinnati Electric Club and Jovian League Branch Merge.—The Cincinnati Jovian Electric Club was formally organized at a meeting of electric men of that city held Jan. 15 at the Hotel Sinton. The meeting was called for this purpose, following several steps taken by members of the Cincinnati Chapter of the Jovian League and the Cincinnati Electric Club looking toward the merger of the two organizations. The latter body was formed a year or so ago on account of the lack of interest which had become apparent in the senior organization, but both continued to exist, with a majority of local electric men holding memberships in both. The move for consolidation, to eliminate the dual membership with its attendant expense and waste of time and effort, began several months ago, and both organizations appointed committees with this object. W. W. Freeman, B. W. Down and Joseph C. Bowman were named for the Jovian League, and Thomas Creaghead, Mr. Wickham and O. B. Marsh for the Electric Club, with Mr. Downs as chairman of the joint committee and Mr. Marsh as secretary. The Jovian committee promptly reported favorably on the plan to consolidate, and the Electric Club took similar action on Jan. 7. The meeting of Jan. 15 was therefore a joint meeting of the membership of the two organizations to ratify the action of their executives and to elect officers for the new organization. The new constitution is virtually that of the Electric Club, so that a Cincinnati man interested in the organization may be a member without at the same time being a member of the National Jovian League. At the meeting the following officers were elected, following the unanimous ratification of the merger: President, F. D. Van Winkle; first vice-president, J. A. Brett; second vice-president, O. B. Marsh; secretary and treasurer, Joseph D. Bowman; directors, W. W. Freeman, W. A. Draper and William Hanley. Addresses were made by W. C. Culkins, Cincinnati, city street railway director, and Vice-president Walter A. Draper of the Cincinnati Traction Company.

Current News and Notes

Timely items on electrical happenings throughout the world, together with brief notes of general interest.

Massillon Announces Its Record Day.—The Massillon (Ohio) Electric & Gas Company closed the year 1917 by making Dec. 31 its record day in output having a net generation for that day of 104,490 kw.-hr., the output for the month of December being 2,786,000 kw.-hr. The output for the year ended Dec. 31, 1913, was but 1,898,374 kw.-hr. The output for December, 1917, was therefore one and a half times that of the entire year 1913.

Pacific Gas & Electric Passes Common Dividend.—In announcing a decision to pass the current dividend on Pacific Gas & Electric Company common stock President F. G. Drum says in part: "In the present circumstances of decreased net earnings and the necessity of conserving the company's cash resources your directors decided to omit any dividend on the common stock for the last quarter of 1917. During the past year our business has grown rapidly. Perhaps the best measure of this is the net addition of 26,699 customers in the eleven months to Nov. 30, 1917, as compared with a net addition of 16,147 in the first eleven months of the preceding year. The average new investment per customer has been steadily increasing since 1911, and is now greater than it ever has been owing to higher labor costs and the practical doubling of the cost of materials. War conditions which, on the one hand, have stimulated our growth and increased the necessity for new capital expenditures, have, on the other hand, made it practically impossible for corporations generally to secure new money except at prohibitive rates. In the eleven months to Nov. 20, 1917, compared with the same period of the preceding year, gross operating revenues increased \$1,096,617, expense increased \$1,661,813, and net operating revenues decreased \$565,196. In the twenty-three months covered by the foregoing comparison 43,949 additional customers have been connected to the company's lines. During the same period \$8,267,892 of additional cash has been invested, substantially all in productive properties, including new hydro electric installations. That this large additional investment, the increased number of customers and the large gross earnings in the conduct of the business have not added to the net income but have served merely to diminish the loss is due to the fact that, notwithstanding the extraordinary increase in the cost of our products, the selling prices of these products have, at best remained stationary and are still established on conditions that existed prior to the war. We confidently expect relief in the near future."

C. H. Sanderson has resigned as assistant chief engineer of the Havana Electric Railway, Light & Power Company to become manager of the auto and truck department of the Frank G. Robbins Company of New York and Havana.

L. E. Caldwell, who for the last five years has been manager of the Iowa City (Iowa) Light & Power Company, has resigned to become manager of the La Crosse district of the Wisconsin-Minnesota Light & Power Company. In this capacity he will have charge of the gas, electric and heating plants in La Crosse, Wis., and its suburbs. For the last two years Mr. Caldwell has been secretary and treasurer of the Iowa section of the N. E. L. A. Before going to Iowa City he was for eight years in the employ of H. M. Byllesby & Company of Chicago.

H. A. Hornor has recently resigned his position as electrical engineer of the New York Shipbuilding Corporation of Camden, N. J., effective Feb. 1. Mr. Hornor has been connected with this company for seventeen years, during which time he has greatly advanced the applications of electricity in the marine field. He is chairman of the marine committee of the American Institute of Electrical Engineers and has been active in various engineering societies. Mr. Hornor has been a frequent contributor to the journals of the electrical technical societies and is the author of the article on marine applications in the "Standard Handbook for Electrical Engineers."

M. C. Gilman, sales manager of the Toronto Electric Light Company, Ltd., has been appointed secretary of the Canadian Electrical Association to succeed Alan Sullivan, resigned. Mr. Gilman was graduated in 1907 from the electrical engineering course at Pratt Institute, Brooklyn, N. Y., and since that time has been employed in the central-station field. He has been assistant power engineer of the Edison Electric Illuminating Company of Brooklyn, assistant power engineer of the Public Service Electric Company, Newark, N. J.; power engineer of the Virginia Railway & Power Company, Richmond; power engineer of the Toronto Electric Light Company, assistant to the chief engineer of that company and for the last four years sales manager of the company.

John Hayes Smith, consulting engineer of Milwaukee, has closed his office to accept a position as assistant engineer to the Public Service Commission of Pennsylvania. Mr. Smith is a graduate of Cornell University. He associated himself with the Westinghouse Electric & Manufacturing Company shortly after graduation, remaining in their employ about six years. He was the first manager of the *Electric Journal*, from which he resigned to become editor of the *Electrical Age*, in which work he remained for four years, when he went to Milwaukee. For two years he was with the Milwaukee Electric Railway & Light Company, resigning as commercial engineer to take up con-

Men of the Industry

Changes in Personnel
and Position—
Biographical Notes

sulting work. For the last four years he has been actively engaged in consulting engineering work in Milwaukee, as well as in rate and valuation work in other states.

Harry F. Butler, formerly associated with the Consolidated Telephone Company, has been elected manager for the Leighton Electric Light Company, Leighton, Pa.

Charles Bulkley Hubbel has succeeded Major Henry W. Hodge, now in military service, as a member of the Public Service Commission for the First District of New York.

Charles N. Black of Ford, Bacon & Davis, New York, has gone to Washington to become assistant manager of the procurement division of the ord-

C. N. BLACK

nance department. Mr. Black is a past-president of the American Electric Railway Association, and up to about a year and a half ago was vice-president and general manager of the United Railroads, San Francisco, Cal. He was elected president of the American Electric Railway Association in 1913.

Guy E. Tripp, who, as noted in these columns, last week, has been appointed head of the division of production of the ordnance department of the United States Army, has received a commission as colonel.

H. B. Sewall, who has long been connected with Stone & Webster properties in the Central West and in the South and Southwest, has been appointed manager of the Whatcom County division of the Puget Sound Traction, Light & Power Company, with offices at Bellingham, Wash., succeeding Leslie R. Coffin, who has been ordered to report for duty at Philadelphia.

F. M. Nourse has joined the advertising department of the Cutler-Hammer Manufacturing Company of Milwaukee in the capacity of technical writer. Mr. Nourse is a graduate of the electrical engineering course of the University of Illinois, class of 1912, since which time he has been engaged in various branches of engineering work. After graduation, several years were spent with the Northern Illinois Utilities Company, after which he became a motor sales engineer for Roth Brothers, Chicago. In 1915 Mr. Nourse took charge of the Portage (Wis.) division of the Wisconsin Power, Light & Heat Company, and later became associated with the Electrical Engineers' Equipment Company of Chicago.

B. J. Denman, for many years vice-president and general manager of the Tri-City Railway & Light Company, Davenport, Iowa, has been elected president of the company. Before going to Davenport four and a half years ago, Mr. Denman was chief engineer of the power plants of the Detroit Edison Company. Mr. Denman entered the electrical field in 1892 as oiler, carshop helper and conductor with the old Toledo Railway Company. From 1895 to 1899 he was electrician for the Toledo & Maumee Valley Traction Company and the next year joined the instructional staff of Toledo University. With W. G. Clark he engaged in consulting engineering work in 1900 and 1901, and for three years following he acted as electrical engineer for the Toledo, Bowling Green & Southern Traction Company, in charge of power houses, shop and rolling stock and overhead lines. In 1905 he became connected with the Detroit Edison Company, and there in addition to being chief engineer he did a large amount of commercial engineering work besides doing practically all of the appraisal work for the Detroit companies and being retained as special engineer and supervisor of power-house construction. Mr. Denman is a graduate of the University of Michigan, where he has served as assistant professor of mechanical engineering and non-resident electrical engineering lecturer on power plants, substations and railway engineering.

Obituary

Frank N. Voshell, engineer at the power plant of the Public Service Electric Company, Camden, N. J., died Jan. 11, at his home, at the age of forty-two years.

Robb Mackie, assistant to manager of the supply department, Westinghouse Electric & Manufacturing Company, died at his residence in Pittsburgh on Jan. 5.

Lieut. Gordon Dale Cooke, who prior to entering the service of the country was a member of the field force of the McGraw-Hill Company, publisher of the *ELECTRICAL WORLD*, died of pneumonia at the base hospital, Fort Bliss, Tex., on Jan. 10. Lieutenant Cooke was a graduate of the University of Michigan.

TRADE & MARKET CONDITIONS

News of the Trade for the Manufacturer, Wholesaler and Jobber
of Electrical Equipment and Supplies—
Notes on Industrial Activities and Business Methods

ANALYSIS OF SITUATION IN ELECTRIC SIGN TRADE

Opportunity Is Afforded to Collect Excellent Sales
Data Which Can Be Used to Good Advantage
When the Fuel Shortage Is Passed

In observing the effect of the Fuel Administrator's order with regard to electric signs, some unusual sidelights have developed. While this order did not exactly kill the electric sign business, it slowed it up to a considerable degree. Some signs, however, are still being sold, especially in water-power territory. The smaller sign-manufacturing concerns are finding it expedient to go into some other line of business which for the duration of the war will prove more profitable. Large concerns which feel that they can weather the storm are afforded an opportunity to collect sales data of a character positively unobtainable heretofore. Merchants with signs are now willing to give actual testimonials that days following "lightless" nights show a falling off in trade. These facts are not being overlooked by wide-awake central-station commercial men or by the more progressive sign manufacturers.

MANUFACTURERS URGE JOBBERS TO PURCHASE LIBERALLY

A Policy Not Altogether Acceptable—Staple Stocks
Ample—Temporary Squeeze on
Heating Appliances

Freight congestion, the responsible cause of the more backward delivery of electrical goods of every description, and also the reported variance in local haulage charges, have been upsetting to jobbing circles. Reports are circulating in the trade that jobbers are being insistently, even persistently, urged to cover their requirements on an unusually liberal scale. This attitude is explained on the ground of the uncertainty of obtaining needed raw material in sufficient quantity, the inadequacy of the labor supply and the continuing delays of shipping, now aggravated by the order for fuel conservation.

A jobber who is inclined to follow a conservative course in buying, but at the same time is almost always in a strong position in caring for his dealer trade, was of the opinion that manufacturers were pursuing a wrong course. He said his and other houses in the field were being induced to place big orders in fear of threatened complications likely to arise from present business conditions. The engagements entered into were to be promptly filled and shipped. The non-arrival of the goods, in the face of what several jobbers believe is a falling market, is causing anxiety. As against this, distributors operating on a large scale declare that, knowing that most factories are behind on orders, the securing of adequate stocks of staple electrical lines is becoming more difficult. Such a condition, it is averred, will therefore probably become even more acute.

Pursuing this line of argument, it is believed by representative houses that the safe course to follow is to allow suppliers all the time possible in filling orders. Prompt attention should be given to requirements for spring stocks, especially construction and line material for immediate use. As a fact, dealers are said to be buying with caution and not anticipating their needs adequately. Doubtless sales would be in larger volume if factories could supply more goods and better deliveries could be assured. Nevertheless, there seems to be a satisfactory movement of general lines.

TAKING THE LOST MOTION OUT OF BUSINESS METHODS

Jobbers Endeavoring to Educate Trade Along Lines
That Will Reduce Cost Incurred in Handling
Small Orders and Return Shipments

Some jobbers in the Middle West are using a direct-by-mail campaign to educate contractors and other customers to the advantages that accrue from ordering in larger quantities and to the necessity of making a service charge on return shipments. As indicating the character of these campaigns the following letter, recently sent to the trade by the Downing Electrical Company of Des Moines, is interesting:

"The big electrical jobbers have been making a very careful study of their orders and find that 55 per cent of them are for less than \$10. The average amount of all orders is \$28.59. The average cost of handling all orders less than \$10 is \$3.93 per order. The cost of handling return shipments is 30 per cent of their value.

"Our good friends can do much to help us hold down our expense in these days, when we are paying twice as much for all kinds of packing materials, cartage, labor, etc., by sending us as large an order as possible and eliminating the return of merchandise whenever possible.

"We realize that you are bound to order merchandise at times when so doing is an error on your part, and we give you this notice so you may know that when we charge 10 per cent service charge on return shipment we are absorbing the big end of the expense. We also want to impress upon you the fact that we are short of salesmen these days and shall appreciate your sending your orders by mail."

EFFECT OF THE WAR ON DEVICES FOR SAFETY

Opinion of Authority Is that the Trend of Events
Indicates that Greater Precautions than Ever
Will Be Taken to Protect Workers

As the result of the knowledge of the vast sacrifices of human life in the war the minds of business men in this country have undoubtedly become accustomed to and inured against shocks from reports of sudden death or physical disablement. Such a transition in mental processes might reasonably be expected to harden the industrial executive against movements for greater safety in the conditions surrounding plant employees. The facts are, however, that this is not the case. The exact opposite appears to be true. Undoubtedly the reason for this condition is the belief, now practically established, that safety movements are not a matter of sentiment but are a matter of good business judgment. It has been found a paying investment to spend money to prevent accidents.

That this is the case is evidenced by the increased business among concerns making safety appliances and concerns marketing consulting safety services. Likewise the increased interest in safety movements since the war brought about the present labor shortage is evident through the same channels. The safety device manufacturers generally are very busy. Some have more business than they can handle. When a group of these manufacturers recently met to discuss an annual convention and exposition for 1918 the interest in this event was intense. The National Safety Council of Chicago showed in its recent annual report that its membership had increased 68 per cent in the last year, which means that 1447 industrial and public utility concerns

subscribed for consulting safety service in that fiscal year and that the workmen reached by this body then had reached a total of 4,500,000. Shipbuilding plants and others engaged in government business are among latest groups to study and apply accident prevention methods.

In spite of this increased effort, accidents in the last year have slightly increased. This has been caused by the immense labor turnover, necessitating the employment of many "green" men. Leading authorities in safety work say, however, that the number of accidents would have increased at a more marked rate under the existing conditions had it not been for the continued effort to prevent them. This growth in accidents is another factor which has contributed to make the business of the safety-device manufacturer continue in a healthy state.

METHOD OF PAYING FOR GOVERNMENT ORDERS

Under Certain Conditions Manufacturers Will Be Reimbursed for Raw Materials Prior to Manufacture

It has not been particularly clear in the minds of some members of the electrical trade just how the government proposes to pay for the goods it buys. In a proposal recently issued for large quantities of electrical goods the General Engineer Depot made the following statement regarding payment:

"Payment will ordinarily be made for each item as soon as it has been inspected, accepted and delivered, properly packed, f.o.b. cars (or boat) at place stated in proposal. Under certain conditions, in the case of standard products the sufficiency of which in their completed form is already known from previous use, partial payments to the extent of a previously agreed-upon percentage of the total cost of each component part of the article to be furnished will be made when such component parts are known to be on hand in the factory ready for assembly. Such component parts will then become the property of the United States, and are to be safeguarded by the manufacturer in a way acceptable to the purchasing officer, in order to prevent loss to the United States through destruction or theft of same."

METAL MARKET SITUATION

The Producers' Desired Advance in Copper Not Realized—Other Metals Unchanged

With no advance in the price of copper such as the producers were aiming for, conditions have not changed from what were previously reported. The conference with the Board of War Industries in Washington adjourned a week ago without allowing the suggested advance to 25 cents, but continuing the present selling figure to June 1, stating its reasons therefor. The price will consequently remain at 23.50 cents for first hands and 24.67½ cents for industrial consumers. Wire is figured on a 30-cent base, and no further reduction is anticipated. No change of any consequence has taken place in connection with the other metals.

THE WEEK IN TRADE

NATURALLY the unusually severe cold weather and unprecedented snowstorms prevailing east of the Rocky Mountains to the Atlantic seaboard have been and are yet the influential factor in the week's business. Shipments were further interfered with and deliveries are slower than before. However, business is reported as not only in a satisfactory condition, but much better than a year ago, with a record breaker predicted for 1918 in electrical goods. Prices were announced on a higher level, averaging 10 per cent, on several staple lines, with a scarcity of merchandise in evidence. Refillable fuses are in demand, as well as flashlamps, motors and electric ranges for cantonments and hotels. Lamps, interior wiring and other articles used in small construction are also selling well.

Collections up to the arrival of the storms were reported from fair to excellent. A setback may follow, but this is only a surmise on the part of correspondents. There is no change in the extension of credits being made since the first of the year.

NEW YORK

Predictions are freely made that 1918 will develop a higher sales record on electrical goods, devices and appliances than has ever before been reached. January's record so far exceeds that of 1917 by a comfortable margin. Jobbers are reported as having liquid stock in ample supply, with a few exceptions, and it is expected to move easily. Buying is said to be on a careful basis, however. Business is especially strong in the coal regions, despite the snowstorms and inclement weather. Deliveries have not improved. Collections are found satisfactory, accounts being settled quite promptly. Caution continues to be exercised with credits.

FUSES.—An active market is anticipated for fuses in this field, particularly of the removable type, according to representative jobbing houses. The manufacturers are getting busy and their sales forces are initiating what promises to be a fruitful campaign. No price changes have been announced.

FLASHLAMPS.—An advance of 10 per cent was recently made by one of the leading flashlamp manufacturers. Business is excellent in this specialty and the demand is brisk.

SOCKET DEVICES.—Preparatory to a strenuous sales campaign during the entire year unusually large stocks of every household socket device are being ordered. This applies more directly to sewing-machine motors and washing machines, with other articles following in close order. It is believed that 1918 will be the greatest sales year in these goods that has ever been known. Studied attention will be given what is known as the "residential buyer" as a potential factor of the future. Current sales are somewhat checked by the curtailment and even refusal of energy by central stations, in obedience to the retrenchment order of the Fuel Administrator.

GLASS INSULATORS.—Within two weeks another advance of 10 per cent on glass insulators was made by one of the oldest manufacturers. A still further price increase is not improbable if present conditions continue. None of the factories is running for lack of fuel, and orders are filled from stock, which is reported as gradually reaching a pretty low stage. Shipments are made promptly from the glass plants when railroads will accept them or they are not prohibited by embargoes; deliveries are not guaranteed.

LINE MATERIAL.—Prices on line material, which have been abnormally high, have been reduced by an Eastern producer 10 per cent, effective Jan. 15. This manufacturer of hardware had accumulated a surplus stock, and reports

say he was obliged to lower his figures to reach a market. This reduction does not apply generally, and quotations are still high in other directions. Locust pins are still scarcer, with prices \$2.50 a thousand higher than previously quoted, also effective as of Jan. 15; but this, too, is an exceptional case. Different mills name varying prices, according to location and stock on hand. Rock-elm pins are being mentioned as coming into use as a substitute for locust, on account of the scarcity and cost of the latter.

COLLECTIONS AND CREDITS.—Prompt returns on collections are the average tenor of reports. Jobbers and distributors have opened the year with their books in better shape than is customary. No relaxation on credits is observed.

CONDUIT PIPE.—The market is reported as bare of conduit pipe in all sizes. A great quantity is in transit, but even the usually well informed on such matters dare not say when the goods may be found. Prices just now do not figure as much as delivery.

PORCELAIN INSULATORS.—High-voltage insulators were marked up 10 to 12 per cent within a few weeks, but the low-voltage type remains untouched. Stocks are none too plentiful and deliveries are slow. High-voltage goods are back four months, caused by slowness of production and delivery, but low-voltage insulators are in a slightly better position.

CHICAGO

During the past two weeks Chicago and the entire Middle West have undergone the most severe weather conditions in their history. Deep snows and severe cold have paralyzed transportation and slowed down industrial activity in every direction. The Garfield order, becoming effective this week, has made business additionally quiet.

Jobbers report orders coming in as usual, but deliveries are very much delayed. In compliance with the coal order business was practically suspended last Monday. Offices as well as factories closed. The general spirit has been to comply with the order as given, although personal opinion is almost unanimously critical of the ruling. Wire prices have not changed. In general there has been very little activity or change in conditions from last week.

A bulletin issued by the American Washing Machine Manufacturers' Association states that manufacturers have agreed to eliminate 171 distinct styles and models as a conservation measure but demonstrates that the washing machine is a labor-saving device and essential to winning the war. The total factory value of the machines produced during 1917 was \$10,000,000, an increase of 42.8 per cent over 1916. Practically all of the plants are situated west of Pittsburgh, and most of them are in the Mississippi Valley.

The entire incoming and outgoing tonnage of the 106 manufacturers was less than 10,000 tons per month. The total coal used during 1917 was only 20,000 tons.

MOTORS.—The motor price book issued Jan. 1 by the Emerson Electric Manufacturing Company, St. Louis, Mo., shows somewhat lower prices on repulsion-start-type single-phase motors, ½-hp. and larger; direct-current motors, ½-hp. and larger, and Davidson exhaust fans. There was no reduction, however, in the prices of other sizes and kinds of apparatus.

BOSTON

Electrical trade continues very brisk, despite the shutdown caused by the Garfield order. Jobbers closed Monday and salesmen on the road suspended work. Some Saturday afternoon work will be necessary partially to offset the curtailment. Jobbers cannot handle the present volume of business in eight hours daily, and as 75 per cent trade in some cases is government work no hope of exemption from the Monday order or short day enforced by the Massachusetts Fuel Administration is entertained. There is a tremendous reduction in central-station loads caused by the fuel order, many companies losing half to two-thirds the station output. The fuel saving is large, but not in proportion to the load reduction. Prices are holding firm; deliveries are temporarily worse because of railroad con-

gestion. There is little change in collections, and the curtailment will probably affect these adversely for a short time. Retail dealers have a rather quiet trade, many going over stocks and planning the year's business along labor-saving lines.

Large orders for switch and wiring material from the government have been given to switch factories, one maker reporting 1000 locking-type switches ordered. The government housing program is also leading to substantial wiring material orders. Porcelain is very scarce and high-priced. Copper is in fairly plentiful supply to electrical manufacturers. Labor is easier in the Connecticut Valley, 4500 men being discharged from munitions work in Bridgeport a few days ago.

The outlook is excellent for electric heating apparatus, especially for table appliances saving labor and conserving food through a better control of the cooking process. A reduced scale of living in smaller quarters predisposes many to purchase grills and small hot-plates. Factory stocks are low. Radiators are in heavy demand and deliveries are impeded by freight embargoes. It is hinted that prices may advance in high-class electric heating equipment for table service, though this is not certain.

Small turbines quote seven months' delivery on the non-condensing sets. There is some delay in getting generators for turbo units. Prices advanced about 10 per cent very recently. Skilled labor is scarce, but no serious effort is yet made to use women in the shops. Raw material is delayed by railroad difficulties, manufacturers state. Probably nine-tenths of the representative small turbine work is for the government.

Wire manufacturers are stocking up on the smaller sizes, and to a moderate extent prices are firm. There is a heavy government demand for power cable. A shutdown hampered production, as the factories on government orders are not generally exempted. The lamp situation is improving, and the entire stock of one manufacturer, wiped out by a fire Christmas week, is now replaced, involving about 500,000 lamps. Barring transportation delays, conditions should improve steadily. Manufacturers are making more lamps than ever before.

ATLANTA

A general rainstorm visited the South Friday and Saturday of last week and covered a wide area, which helped the water-power companies materially, but the precipitation was not sufficient in some sections to insure altogether against future curtailment from these sources. The timely rains, however, will permit the water-power companies to shut down auxiliary steam generating equipment during the present crisis and supply all power requirements from hydroelectric sources until the water gives out or, at least, until the five-day fuel-conservation period has expired. The sections using fuel for power purposes have calmly acquiesced in the disturbing industrial order, and the sections served from hydroelectric transmission lines are thankful for being allowed to continue operations. Although the industrial fabric has received a severe shaking, an undercurrent of optimism prevails in this section regarding future business activity.

Reports from authentic sources indicate that Americus, Ga., has been selected for an aviation camp, similar in type to the one being constructed at Montgomery, Ala., which will call for the expenditure of several millions. The government has definitely decided to locate a repair shop at Atlanta, Ga. This plant will cost in the neighborhood of \$2,000,000.

It is reported that General Crozier has arranged for the immediate construction of a powder plant, to cost \$60,000,000, at Hadley's Bend on the Cumberland River, near Nashville, Tenn. This plant will cover 4600 acres and employ 15,000 men.

STEAM-FLOW METERS.—The demand for this type of meter in the last year has been more or less sporadic, but the recent publication by the Fuel Administration of literature on fuel conservation has stimulated activity in this line and a number of equipments are being purchased for boiler rooms and slashers in the textile field.

SEATTLE

The week from Jan. 14 to 21 shows general business maintaining a steady and substantial volume, with both jobbers and retailers reporting gratifying sales far in excess of those experienced last January. Seattle jobbers report sales to shipyards, mills and other industrial plants very satisfactory, although there is no particular increase over last week. Seattle retailers, however, report a noticeable increase in sales, due primarily to increases along residence repair and building lines, over last week and a distinct increase in sales over January of last year. Portland jobbers report the placing of an extra large order for power apparatus, including motors, generators, turbines, panels, etc., for a million-dollar steel shipyard in Vancouver, Wash. This yard recently received a contract from the government for ten steel ships of 9500 tons capacity at a price of approximately \$17,000,000. The new plant will also manufacture boilers and machinery. Another four-million-dollar contract for steel ships was received last week by the Portland yard from the United States Shipping Board.

Portland jobbers as a whole report exceptionally heavy business with industrial plants so far this year. Retailers also report increasing sales of fixtures, wiring devices, lamps and other things used in small construction. Orders for cannery supplies for Alaska are being placed in large amounts more than a month earlier than was the case in previous years.

Buying will continue until April, when navigation to the north will be open. Cannery men are making space reservations with steamship companies and are not taking chances of a shortage of vessels in Alaska due to the war. Jobbers report that, while buying is heavy, the volume this year will not be so large as last year. While large orders are being placed for motors, generators and electrical accessories for new canneries, a large portion of the volume will be for repairs, maintenance and enlargements. Alaska electrical dealers are not buying nearly so heavily as last year, reporting business decreasing materially, owing primarily to the closing down of many mines on account of low-grade ores, increasing cost of labor and labor shortages, and secondarily to migration of Alaskans to Northwestern shipbuilding cities. Fisheries and canneries will continue activities as usual and government railroad work will proceed, otherwise Alaska is expected to be comparatively quiet.

Reported activities of small telephone companies in rural communities, looking toward some new construction and repairs, lead jobbers to believe small orders for wire, pole-line equipment, etc., will be placed shortly. Sales to telephone companies for the year past have been light, mostly for maintenance and repairs.

The contract for 500,000 incandescent lamps for Seattle's municipal lighting department will be let Feb. 1. The Board of Works of Seattle will open bids March 1 for the proposed five-million-dollar hydroelectric plant.

Steadily increasing demand for real estate has been a feature of the Seattle market since the beginning of the new year. Building permits for the first three weeks in January show an increase of 80 per cent over those for last year. Electrical permits in both Seattle and Tacoma since Jan. 1 show an enormous increase over same period last year.

During the first nineteen days of this month Seattle shipyards established a record that eclipses the industry's entire record for the year 1916. A vanguard of 20,000 skilled mechanics, who are to be sent to Northwest shipyards to carry on the gigantic shipbuilding program, arrived Monday. Owing to the enormous prices offered for timber products, many new logging firms are springing into existence. Machinery houses note increasing demand for machinery.

The freight situation remains very unsettled. Deliveries are bad, with no evident signs of immediate betterment. The government has not yet begun to insist upon maximum car loading. Intra-terminal switching is slowly being worked out, but the results expected have not materialized.

FUSES.—There is an increasing demand for refillable fuses, a large number of which are being used for repairs and maintenance work. Prices are steady and stocks are adequate.

HOUSEHOLD APPLIANCES.—Movement is quite slow as was to be expected following heavy holiday sales. How-

ever, irons, washers and sewing machines are selling better than could be expected.

WIRE.—A slight drop in price was noted early in the month. Stock shortage is no worse than heretofore reported. Deliveries are very unsatisfactory. The volume of sales shows a slight increase during past two weeks.

PORCELAIN.—The demand is increasing and shipments are hard to obtain and prices are on the increase.

SAN FRANCISCO

War-time activities or matters incidental thereto have steadily increased in their percentage of total business done, and changes that came with the new year have given this percentage large advances. Committees are effectively at work in relieving freight congestion and encouraging fuel economy. In the San Francisco "power dictator" is centered the control of more than 400,000 hp. Farm and factory are being made to serve war-time needs. New lumber mills are being laid out, primarily to supply material for shipbuilding and airplane plants. The mining of certain metals has been speeded up, while others are being neglected. In the bay region the construction of new yards for both steel and wooden vessels is so common as no longer to attract special attention. Collections are reported as very satisfactory, and practically no change in the extensions of credits has been made since the new year.

ELECTRIC RANGES.—Special attention is being given to hotel-type ranges and bake ovens. Installations of large size—that is, as many as six hotel-type ranges each—are being considered at some of the cantonments, and inquiries are being received from many organizations which provide food for large numbers of employees, guests or men in government service. Ranges of types for family use are not usually active at this season. Jobbers are holding off on 1918 range orders, apparently to see what effect the heating-appliance merger will have on the manufacture of ranges and because there have been rumors of a standardized range, but representatives of manufacturers in the merger affirm that three distinct types will be manufactured as heretofore. Family range sales in 1917 were 40 to 50 per cent more than 1916 sales, and an equal rate of increase over last year is predicted by manufacturers for this season. Power companies are less confident, but manufacturers point out that the business will be forced upon them because of the publicity.

METERS.—There is a steady demand for meters of switchboard type, and customers are becoming accustomed to taking substitutes in place of the exact type desired.

INTERPHONES.—One large company which has for some time solicited no business and refused orders for interphones has resumed the manufacture of this line and is now again actively in the market.

MOTORS.—The lowest rainfall on record in California has caused a rush for irrigation installations, and one company reports ten orders in rapid succession for motors of more than 100 hp., all for irrigation use. The demand for small sizes also continues steady, but no material change in delivery conditions is apparent. Several new irrigation districts will be completed and put in service this year, which will call for electrical equipment.

BUILDING CONSTRUCTION.—There is continued activity in the building line in the smaller towns, particularly in agricultural districts. The city of Sacramento has building construction totaling \$6,250,000 projected for this year. A considerable part of this is for Capitol extensions, but in part it reflects the generally prosperous condition of the agricultural areas in the Sacramento and San Joaquin valleys.

MOVING-PICTURE MACHINES.—A considerable trade in portable moving-picture projectors has been built up this winter, and the demand is increasing. The popular type are motor-driven machines costing slightly more than \$100. These are used for instruction purposes in training camps and schools and for demonstrations. The accessories, including lenses, are rheostats, carbons for lamps, lamp cord and fuses.

Current Prices of Electrical Supplies

New York and Chicago Quotations

THE prices quoted are those prevailing in standard packages or specified lots on apparatus and appliances in Eastern and Middle West markets at the beginning of business on Monday of this week. They are in all cases the net prices or prices subject to discounts from standard lists of contractors, central stations, dealers and others engaged in the resale of such goods.

Prices in Southern and other nearby markets will rule about the same as those in the Middle West, although slight modifications to cover increased freight and local demands should be expected. In the Far West and on the Pacific Coast the prevailing prices are naturally higher, covering as they must

increased freight and the necessity of larger stocks with increased interest and warehouse charges on account of the distances from sources of supply, infrequent turnover of stock and uncertainty as to delivery of goods in transit. Moreover, the Far West presents a wide variation in demand due to a small population spread over a wide area in agricultural and mining communities, as contrasted with the denser population of the East and Middle West, their nearness to the source of supply, the more frequent turnover in stocks and the constant demands which arise in industrial centers. Price variations may be due to difference in grade of products of different manufacturers, to local conditions, or to both.

NEW APPARATUS & APPLIANCES

A Record of Latest Developments and Improvements in Manufacturers' Products Used in the Electrical Field

Induction Motors

A line of two-phase and three-phase induction motors is now being offered the trade by the Phoenix Electric Company, Mansfield, Ohio, which has been standardized in construction. The stator or stationary part of these motors has a solid cast-iron frame into which are built the thin steel punchings which make up the magnetic circuit of the stator. The stator slots are partly closed, thus obtaining greater starting torque, it is pointed out, than with the open-slot type, and thereby reducing the inrush of starting current. The starting coils are carefully wound and taped and thoroughly impregnated with insulating varnish, making them waterproof.

Special attention has been given to the rotor to make it as durable as possible. The laminations are assembled directly on the shaft between malleable-iron heads, and heavy copper rings are securely riveted to the rotor bars and soldered, making a construction that is practically indestructible. With motors of $7\frac{1}{2}$ hp. and larger a starter is provided which is of standard design of resistance type, without no-voltage release.

Louvers for Ventilating Fans

Louvers that are especially designed to prevent back draft and provide weather protection to fan openings when the fan is not running are made by the Batterman Truitt Company of Chicago. They consist of a number of semicircular vanes connected together in series. These vanes are pivoted slantingly with respect to a vertical plane and are inclined to drop

PREVENTS BACK DRAFT AND WEATHER PROTECTION

into a closing position without exerting an excessive resistance against their opening movement caused by air directed against them from the opposite side. The vanes when open or in partly open position occupy a dihedral angle with respect to the plane of

opening and thereby, it is pointed out, afford a better passage of air from the fan that will parallel vanes operating transversely with respect to their opening.

These louvers operate with practically no restriction on the fan. They are so designed that, the area of the center bridge being calculated and allowed for in the total outer frame dimensions, no restriction is caused by the center bridge. These louvers, it is said, are not affected by moisture, heat or by ordinary vapors.

Two-Piece Porcelain Sockets for Reflectors

P. & S. 1233, a two-piece porcelain socket without shade-holder groove, and its companion piece, P. & S. 1234, with shade-holder groove, have been placed on the market by Pass & Seymour, Inc., of Solvay, N. Y., for heavy-duty sockets for medium or normal base type "C" lamp fixtures. These receptacles have ample wiring room or clearance for a

SOCKETS WITH AND WITHOUT SHADE-HOLDER GROOVE

single or double pair of wires in the terminal hood, which may be supported by substantial machine screws spaced $1\frac{3}{16}$ in. (3 cm.) on centers.

These receptacles are entirely front-connected, and the socket body is easily positioned by the aid of heavy porcelain tenons. All live parts, where necessary, are sealed in with a special compound which will successfully resist the extreme temperature to which the devices may be subjected in use.

Electric Log

The Majestic Electric Development Company, 1705 Allegheny Avenue, Philadelphia, is making an electric log for use in home fireplaces. Three elements of 6.15 watts each are mounted in front of a polished copper reflector. A regulating switch gives combinations of one, two or three units. The complete log weighs 35 lb. (15.8 kg.) and measures 19 in. by 12 in. by 10 in. (48.3 cm. by 30.4 by 25.4 cm.)

Lyre-Top Fixtures

Lyre-top fixtures designed for use in railroad yards and similar places have been designed by the Wheeler Reflector Company, 16 Pearl Street, Boston, Mass. The fixture on the right

DESIGNED FOR USE IN RAILROAD YARDS

has a canopy with ports cast in the side into which the arms are screwed for forming the frame of the bracket. This canopy has a copper screw ring rolled inside which engages the threaded collar on the reflector, making a rigid support. The lyre top shown on the left is used with a high-tension series porcelain receptacle head and the same reflector shown on the right.

Inclosed Switches

Safety steel-inclosed switches that will operate in either a horizontal or perpendicular position, or may be reversed end for end, are being marketed by the Leonard-Bundy Electric Company of Cleveland, Ohio. The door of the cabinet cannot be opened without tripping the switch, which makes it impossible to fuse a live switch. The switch cannot be partly closed and left there, giving insufficient contact and heating of receptacle springs, because this switch is so arranged that if it is not fully closed it will fly open again.

A quick-break action is provided so that no arcing occurs at the contacts. The lever and toggle principle is embodied in the handle, and an easy pull will close the switch, while a slight blow is all that is necessary to open it, the switch in fact opening itself after being once started.

The switch and cabinet are built very substantially and are designed to stand up under very severe usage. The cabinets are made of No. 12 gage steel and are reinforced with angle iron throughout, while the switch is not only rugged and durable but will stand 50 per cent to 100 per cent overload without heating, it is said.

Luminous Indicator for Pull-Chain Sockets

A small luminous bulb which contains radium and glows in the dark is now being made by the Eastern Luminous Indicator Company, Inc., Waltham, Mass., for attachment to pull-chain sockets. This company is using the same radium compound in these small bulbs as has heretofore been used on dials and hands of watches, cages, clocks, compasses, etc., which it manufactures.

Charging Apparatus for Miner's Lamps

For the multitude of miner's electric lamps used in the mines a standard easily extensible charging rack has been developed by the Cutler-Hammer Manufacturing Company of Milwaukee. Each charging rack is designed to hold ten batteries, and as each rack is a unit an equipment may be laid out for a large number of lamps, or a small equipment can be purchased at the start and subsequently extended when additional lamps are purchased.

The racks are arranged to hook on brackets clamped on vertical $1\frac{1}{4}$ -in. (3.2-cm.) iron pipe supports. Two of these brackets are furnished with each rack, and they are so designed that in adding to an equipment it is not necessary to disturb the brackets which are already in place. The racks are built with a substantial steel frame which carries slate slabs on which the batteries are placed for charging. The batteries are placed in the racks edge-wise like books in a bookcase, which makes the apparatus very compact. Partitions are provided which prevent the battery cases from making contact with one another, and their design is such that a battery cannot be placed in the rack with the polarity reversed. On the top of the frame is mounted a slate slab carrying the contact parts. An inverted mushroom-shaped contact piece projects below this slab and is pressed in contact with the battery terminals by a substantial coiled spring. This is the only contact which is below the slab, all other current-carrying parts being mounted on the top, where they

UNIT CHARGING RACK CAPABLE OF ACCOMMODATING TEN BATTERIES

are out of the way of any discharge from the battery vents.

The circuit through the rack is laid out so that the batteries are charged in series, but provision is made by means of interpolating resistances so that one or any number of batteries can

be removed from the rack without appreciably affecting the charging current through the remaining batteries. It is thus possible to remove or add batteries to a rack during the charge at will without the necessity for adjusting the rheostat. The contacts are all interchangeable, and it is a simple matter to remove the mushroom contacts for inspection or cleaning should this be found necessary.

Equally spaced contact plates are installed on the front of the frame and connected to the contacts for the battery terminals, making it possible to read the voltage across any battery in the rack while it is on charge without interfering with the charging circuit. A rheostat panel is used with each set of charging racks. The number of charging racks that can be used with one rheostat is governed by the voltage of the charging circuit end.

Pivoted-Cap Cleat Rosette

A cleat rosette of special rugged construction, designed to carry the wires fully $\frac{1}{2}$ in. (1.27 cm.) from the surface wired over, has been brought out by Pass & Seymour, Inc., Solvay, N. Y. The terminals are arranged to separate the wires by a space of $2\frac{1}{2}$ in. (6.35 cm.), and the binding screws which secure the cap to the base are so arranged that the cap may be pivoted on one end while the other end of the cap, when the binding screws are released, swings in

AMPLE WIRING ROOM IN BASE

or out of position and is thereby made easy to wire on a step-ladder or at the bench. Ample wiring room will be found in the base, and provision is made in the cap for a practical knot in the drop-cord to relieve the strain on the terminals. This rosette has been designated P. & S. 565.

Insulating Tubing

A line of insulating tubing is now being made by the Fibro Products Company, New Bedford, Mass., which is fibrous in structure and not so dense as vulcanized fiber. The maker points out that its structure is between that of ordinary paper tubing and a vulcanized fiber tube. It is claimed that it is extremely strong and possesses the advantages of being waterproof, of high dielectric strength and retaining its size and shape. The material lends itself to the processes of manufacturing tubing and makes it possible to produce a tubing with little variation in size. The company mentioned is now equipped to produce fibro tubes in any practical diameter, wall thickness and length.

Foot Warmer for Outdoor Service

To minimize the discomfort of long standing outdoors in severe weather, an electrically heated foot warmer has just been placed upon the market by the Westinghouse Electric & Manufacturing Company of East Pittsburgh, Pa. While designed primarily for look-

GIVES UNIFORM DISTRIBUTION OF HEAT

outs stationed in the bow and crow's nest of vessels, the device is applicable to the use of watchmen, sentries, door-men, traffic policemen and others whose work requires them to be out of doors continuously with little chance for exercise. It has been found that if the rest of the body is adequately clothed, a foot warmer will insure comfort at any temperature.

The device consists of a casting 14 in. by 20 in. by 25 in. (35.6 cm. by 50.8 cm. by 63.5 cm.), with diamond-tread top. This is of cast iron or of a non-magnetic metal when desired, as in ship service. Against the under service of this the heater element is clamped. The heater is a slotted ribbon clamped between two plates of built-up mica so arranged as to give uniform distribution of heat. A sheet-steel plate fastened by screws and sealed with high-melting gum renders the entire unit waterproof. The resistance is divided into two parts, which may be connected to draw 200, 100 or 50 watts at 125 volts. A three-conductor cable 7 ft. (2.1 m.) long is provided. By using the lower heats in mild weather there is no danger of causing chilblains.

Attachment Plug

A solid attachment plug, called the "Jiffy Junior," has just been put on the market by the Best Electric Company of Pittsburgh, Pa. The "Jiffy Junior" is made in one piece (with separate tip) of asbestos composition. The terminals are molded into the plug, and the brass screw shell is die-stamped permanently into place, giving a most substantial construction. By loosening one screw, the tip is removed and the plug is open for wiring. The wires are then cut to even lengths. No knots are necessary, as the right-angle strain reliefs securely hold the wires. This plug has the advantage of being quick and easy to wire. It is wired in the open, and one screw holds the plug together securely. Being made of asbestos composition, the plug, it is claimed, is indestructible and safe to use with any device.

Trade Notes

W. G. ARTHUR REID has been appointed general manager of the Bryant-Marsh branch of the National Lamp Works of the General Electric Company, centering at Detroit, Mich. This will be a separate division.

THE FIRST NATIONAL BANK of Boston, Mass., assisted by its branch in Buenos Aires, Argentina, is in a position to furnish exporters and importers with dependable and credit information and reliable statements of market conditions in the Argentine.

THE VULCAN STEEL PRODUCTS COMPANY of New York City is publishing a spirited illustrated monthly house organ entitled *Vulcan*. It is a journal of co-operation and help for the Vulcan company's interests, particularly in its rapidly developing export trade.

THE MOLONEY ELECTRIC COMPANY, LTD., of Toronto, Can., announces that it has opened a branch office and warehouse at Halifax, N. S., for the Maritime Provinces. E. A. Seath, who has been transferred from the Montreal office, will have charge of that territory.

JOHN D. STOUT has been appointed Chicago representative for the Terry Steam Turbine Company, Hartford, Conn. Mr. Stout was at one time assistant engineer of the Terry company and was recently transferred from the New York office, where he was assistant manager.

BURTON FRENCH, who has been associated with the Insull organizations in Chicago for the last eighteen years, has opened an office at 492 Continental and Commercial National Bank Building, as a consulting engineer, to engage in the preparation of appraisals, examinations, investigations and reports upon public utility properties for financing and operation.

THE IRVING NATIONAL BANK of New York City has issued for general distribution a pamphlet entitled, "Practical Questions and Answers on the Trade Acceptance Method." Besides the clearly presented information contributing to the campaign of education in the more general use of this species of commercial paper, it contains the improved trade acceptance form approved by the American Trade Acceptance Council. This body embraces committees of the Chamber of Commerce of the United States, American Bankers' Association and National Association of Credit Men.

THE ROBBINS & MYERS COMPANY of Springfield, Ohio, has appointed Edgar A. Wilhelm, manager of its export department, with offices at 30 Church Street, New York City, in connection with the company's domestic quarters at the same address. Therefore, the concern's export business was looked after by Mr. Wilhelm as president of Edgar A. Wilhelm, Inc., which handled the foreign trade of several other manufacturers. The new appointee has made seven trips around the world, traveling in Europe, the South and Central American countries and the West Indies; consequently he is familiar with the details in connection with handling foreign business.

THE AMERICAN CHAMBER OF COMMERCE of Paris, France, desires to bring to the attention of American manufacturers who are sending copies of their catalogs to France the advisability of printing on such catalogs the date of their issuance. While catalogs sent to chambers of commerce and consulates are stamped with the date of their receipt and therefore an approximation of when they were issued is possible, if a business house or other recipient does not so stamp an incoming catalog there is a great chance of confusion of dates, with consequent misunderstandings between the foreign buyer and the American seller as to price, patterns, etc. The chamber has recently established a catalog file, and now possesses catalogs of more than 500 American firms. Owing to the ever increasing demand for American products and devices, members of the chamber as well as all American manufacturers interested in export trade are invited to send their catalogs to the chamber. These catalogs, after being properly indexed, will be open to all inquirers.

A NEW WESTINGHOUSE DEALER MAGAZINE.—To stimulate dealer interest and co-operation, the Westinghouse Electric & Manufacturing Company has just begun the issuance of a monthly publication. This paper is to be known as *Contact* and is the same size as the *Saturday Evening Post*, to permit effective display of its contents and full-scale reproduction of advertisements in

national mediums. The new magazine will replace the Westinghouse company's monthly *Merchandising Calendar* and also the special publications distributed on merchandising campaigns which are issued from time to time through the year. The intention is to make *Contact* a clearing house of ideas for Westinghouse distributors. Whether these ideas cover window display, stock accounting, stock arrangement, canvassing or any merchandising problem, they will be welcome in its columns. New sales ideas, successful campaigns, plans for more business, for bigger net profits, for better service from employees, are being solicited by Westinghouse representatives throughout their trade. The first issue contains articles on getting rid of after-Christmas stock, bigger profits by better planning of advertising according to a definite schedule, sales letters that "bring home the bacon," and the value of the proper spending of our money in winning the war. *Contact* is sent gratis to dealers in Westinghouse supplies and appliances.

THE LYONS FAIR will be held at Lyons, France, March 1 to 15, 1918. It will be the third annual event, the first two fairs having been held in 1916 and 1917 in the full tide of war. The press has recorded an almost unhopd-for success. The amount of business transacted was 57,000,000 francs in 1916 and 180,000,000 francs in 1917. The last figures do not include the business done by means of catalogs in the United States bureau. The amount of this business alone totaled \$42,000,000. Numerous and lasting business relations have been created between parties who were entirely unknown to each other before the advent of the fair. In 1916 no American concern was represented at the fair, and last year, in spite of extensive publicity, only thirty-three firms were represented. It is hoped, however, that this year the United States will be well represented. American business men should realize that the Lyons Fair will give them contact not only with French buyers but with buyers from Spain, England, Holland, Italy and all the other exhibiting countries. This fair is not an exhibition but a commercial proposition. No goods can be sold at retail, orders being booked in wholesale quantities from samples exhibited. Particulars concerning rules and regulations may be obtained from George B. Van Cleve, 1790 Broadway, New York City, who is chairman of the American committee of the Lyons Fair.

Trade Publications

MILLIVOLTER.—The Pyroelectric Instrument Company of Trenton, N. J., has issued circular No. 9, descriptive of its Northrup millivoltmeter.

PORTABLE TOOLS.—The Stow Manufacturing Company of Binghamton, N. Y., is distributing a bulletin entitled "Portable Tools of Proven Value."

STOKERS.—Leaflet 3986, descriptive of underfeed stokers, has been issued by the Westinghouse Electric & Manufacturing Company of East Pittsburgh, Pa.

LIGHT CONTROLLER.—The Barrett automatic light controller for Ford cars is described in a leaflet prepared by the American Sales Corporation of Pittsburgh, Pa.

SECOND - HAND MATERIAL.—The Walter A. Zelnick Supply Company of St. Louis has issued a bulletin, No. 230, in which is listed its material on hand for immediate delivery.

RAILWAY DATA.—The Westinghouse Electric & Manufacturing Company of East Pittsburgh, Pa., is distributing Vol. 1, No. 3, of "Railway Engineering Data." A reprint from the *Electric Journal* on "Problems Confronting the Electric Railway Industry" is also being distributed.

HEAT REGULATOR.—The Western Electric Company of New York has prepared a folder in which is described the new heat regulator recently offered to the trade. This circular points out the prominent features of this device, how the contractor can sell it, what it does and how it works.

HEATING DEVICES.—The Simplex Electric Heating Company of Cambridge, Mass., has prepared eighteen bulletins, inserted in one folder, in which are described and illustrated the heating devices of this company. The devices described are soldering irons, household devices, glue pots, baking ovens, water heaters, hotel appliances, immersion coils, disk stoves, fry kettles, ranges, radiators, hot closets, laundry and tailor equipment and instrument sterilizers.

SPACE HEATER UNIT AND AIR HEATER.—Two small six-page circulars have just been published by the Cutler-Hammer Manufacturing Company of Milwaukee. One folder is entitled, "C-H Electric Space Heater Unit" and describes a steel-jacketed unit which is approximately the size of a 2-ft. rule. The circular describes a number of applications of this unit, giving several suggested ways of mounting it. The circular also makes note of the fact that these heater units are now put up in standard packages of ten each, carrying a label at each end so that the boxes can be easily identified when carried on the shelves of the stockroom. The rating of each unit is 500 watts, and they may be used on either alternating-current or direct-current circuits. The other circular is entitled, "C-H Electric Air Heaters." These heaters are divided into a number of groups, several being for industrial or mill use, made with ratings of from 2 kw. to 10 kw. Other heaters are illustrated and are particularly desirable for offices, bedrooms, bathrooms, etc., and have a better appearance than the mill or industrial type of heater. The dimensions, ratings and prices are given in the folder.

New Incorporations

THE ROCK RIVER POWER COMPANY of Watertown, Wis., has been chartered with a capital stock of \$5,000 by George E. Man-shot, A. M. Keniston and Pulius Podolski.

THE DAVISON ELECTRIC COMPANY of Tulsa, Okla., has been incorporated by Frank S. Davison, Jay Collis and James E. Hotham of Tulsa. The company is capitalized at \$10,000.

THE AJAX ELECTRIC COMPANY of Jersey City, N. J., has been incorporated with a capital stock of \$100,000 by W. C. Banks, H. Shippen and D. C. Roberts, all of Hoboken, N. J.

THE TIDEMAN ELECTRIC MANUFACTURING COMPANY of Cairo, Ill., has been chartered with a capital stock of \$650,000 by Henry Tideman, Charles M. Roos and James H. Galligan.

THE DIX-KELLY ELECTRIC SHOP of Fort Wayne, Ind., has been incorporated by Robert E. Kelly and Frank Dix. The company will do a general electrical service and supply business.

THE LUCKEY (Ohio) LIGHT & POWER COMPANY has been incorporated with a capital stock of \$5,000 to generate and distribute electricity. The incorporators are: Chester C. Martin, George Weiling, William Aspacher, William L. Hoelter and William H. Schwane.

THE R. I. ELECTRICAL INSTRUMENT COMPANY of Providence, R. I., has been incorporated by Claude R. Branch, Edson K. Smith and Herbert J. Humphrey of Providence. The company is capitalized at \$50,000 and proposes to do a general manufacturing business.

THE WHITEWATER POWER & MINING COMPANY of Wilmington, Del., has been incorporated under the laws of the State of Delaware with a capital stock of \$500,000. The company proposes to do a general mining business, distribution of power by steam, electricity, etc.

THE AMERICAN SYNDICATE OF INDUSTRIAL ENGINEERING of New York, N. Y., has been organized with a capital stock of \$180,000 to do a general electrical engineering and contracting business. The incorporators are George V. Reilly, S. B. Howard and A. W. Britten, 65 Cedar Street, New York, N. Y.

THE AUTOMATIC ELECTRIC LIGHT COMPANY has filed articles of incorporation under the laws of the State of Delaware. The company is capitalized at \$1,000,000 and proposes to manufacture electric lamps, globes, etc. The incorporators are: A. W. Britton, S. B. Howard, G. V. Reilly, all of New York, N. Y.

THE MESSER & ZUBER MANUFACTURING COMPANY has filed articles of incorporation under the laws of the State of Delaware with a capital stock of \$200,000. The company proposes to manufacture automatic signal lamps for automobiles, etc. The incorporators are: S. N. Messer, L. F. Zuber and F. J. Rocks of Brookville, Pa.

THE BRASSIE-BOWERS ELECTRIC COMPANY of Indianapolis, Ind., has been incorporated by Ralph E. Bowers, Lloyd M. Bowers and Ralph A. Brassie. The new company will take over the fixtures, merchandise and lease of the office at 637 Main Street of the Decker-Chadbourne Electric Company, which recently went into the hands of a receiver.

New England States

MANCHESTER, N. H.—The Manchester Traction, Light & Power Company has purchased the water rights connected with the United States Bobbin & Shuttle Company, giving the company all the water privileges that are desirable from the mouth of the river in this city, where it empties into the Merrimac River and the village of Goffstown.

CHICOPEE, MASS.—The Turners Falls Power & Electric Company will install at once an additional 750-kw. motor-generator set at its local plant.

GREAT BARRINGTON, MASS.—The Great Barrington Electric Light Company has petitioned the State Gas and Electric Commission for an approval of an issue of \$180,000 in capital stock to pay for additions and extensions to its plant and system.

GREAT BARRINGTON, MASS.—A joint petition has been presented to the State Gas and Electric Commission by the Great Barrington Electric Company, the Lenox (Mass.) Electric Company and the Stockbridge Lighting Company for approval of the consolidation of the three companies.

LEOMINSTER, MASS.—The City Council has accepted a contract with the Leominster Electric Light & Power Company for lighting the streets of the city. The contract provides for a franchise permitting the company to erect a transmission line through Florence, Howard, Lancaster and Litchfield Streets and Elm Hill Avenue, to connect a substation with its main line from Still River.

PALMER, MASS.—Plans have been filed by the Wright Wire Company for the construction of an addition to its local plant, for which contract has been awarded to the Eastern Bridge & Structural Company, 88 Crescent Street, Worcester.

STOCKBRIDGE, MASS.—The Stockbridge Lighting Company has applied to the State Gas and Electric Commission for permission to issue \$8,500 in capital stock, the proceeds to be used for extensions and improvements to its plant.

TURNERS FALLS, MASS.—During the present year the Turners Falls Power & Electric Company will put into operation a new station, known as the Hampden station (steam generating), which will be equipped with eight 652-hp. Edge Moor boilers, two 15,000-kw., 13,200-volt, three-phase, 60-cycle turbines, six (two banks) 6250-kva., single-phase, 66,000/13,200-volt Westinghouse transformers, and H-6 and KO-26 oil switches.

WOBURN, MASS.—The City Council is considering compelling the Edison Electric Illuminating Company to place its wires underground on part of Main Street.

Middle Atlantic States

ALBANY, N. Y.—Three bills have been introduced in the State Legislature by Senator Gibbs of Buffalo, providing for the construction by the State of a hydro-electric plant on Goat Island, Niagara Falls, to develop 50,000 hp. If the measure should be approved by the voters, provision would be made for a bond issue of \$3,000,000. Under the terms of the proposed bill the plant would be operated either under the management of the State or by lease.

BROOKLYN, N. Y.—Plans are being prepared by the Interborough Rapid Transit Company, 165 Broadway, New York City, for the erection of a one-story transformer station, 50 ft. by 100 ft., on Livonia Avenue, near Rockaway Avenue, Brooklyn, to cost about \$40,000.

ELMIRA, N. Y.—Bids will be received at the office of the supervising architect, Treasury Department, Washington, D. C., until Feb. 14, for installing a conduit and lighting system in the United States post office at Elmira, N. Y. Drawings and specifications may be obtained at the above office or at the office of the custodian at Elmira.

MECHANICSVILLE, N. Y.—The City Council has authorized the commissioner of public works to prepare specifications for bids for lighting the streets and public buildings of the city of Mechanicville, to be opened not later than Jan. 28. Two forms of bids are to be submitted, one for a straight five-year contract from Feb. 1, 1918 to Feb. 1, 1923, the other to be subject to cancellation at any yearly period after Feb. 1, 1919.

MIDDLEPORT, N. Y.—The capital stock of the Middleport Gas & Electric Company has been increased from \$30,000 to \$50,000.

OGDENSBURG, N. Y.—The Oswegatchie Light & Power Company of Gouverneur, it is reported, is contemplating extending its electric transmission line into Ogdensburg

Construction

News of Projects, Plans, Bids and Contracts. Notes on Work Under Way.

SCHENECTADY, N. Y.—J. C. Aitkin, 216 South Centre Street, is contemplating the construction of an extension (one story) 50 ft. by 80 ft., to his storage battery works.

SPRINGVILLE, N. Y.—Power lines of the municipal electric-light plant will be entirely rebuilt this summer. About 2 miles of line has been completed and probably as much more will be erected during this year.

UTICA, N. Y.—Plans have been filed by the Utica Steam & Mohawk Valley Cotton Mills, 1000 Broad Street, for the construction of an addition to its power plant, 30 ft. by 70 ft., one-story, to cost about \$11,000. Contract has been awarded to George Hopp, 1022 Seymour Street, Utica.

BURLINGTON, N. J.—A section of the power plant and laundry building of the Masonic Home, located outside of the city limits, was destroyed by fire on Jan. 14, causing a loss of about \$12,000.

JERSEY CITY, N. J.—Plans have been filed by the Public Service Electric Company for an addition to its plant at the foot of Duffield Avenue, to cost about \$4,000.

JERSEY CITY, N. J.—A bill has been introduced in the Legislature providing for an issue of \$150,000 in bonds for the proposed improvements and extensions to the Hudson County electric plant, to enable the plant to furnish electricity for lighting the county institutions, streets, etc.

KENILWORTH, N. J.—The Borough Council has voted to enter into a contract with the Public Service Electric Company for lighting the streets of the borough. The contract calls for 58 lamps.

KEYPORT, N. J.—Application has been made to the City Council by the New York Telephone Company for permission to install new underground conduits in a number of additional streets in the city.

LAMBERTVILLE, N. J.—The Lambertville Public Service Company has announced that, due to the shortage of coal, the electric street-lighting system will not be operated until further notice.

LODI, N. J.—Bids will be received by the Mayor and the Borough Council until Feb. 11 for the construction of an auxiliary pumping plant and extension to the water distributing system, consisting of brick structure and chimney, boiler, feed pump, etc., and cast-iron pipe. Copies of plans and specifications may be obtained from Thomas F. Bowe, consulting engineer, Association Building, Rutherford, N. J., or 95 William Street, New York, N. Y., upon deposit of \$15, of which \$12 will be refunded.

TRENTON, N. J.—The Public Service Corporation has announced that all arrangements have been perfected for the early installation of an electrolysis mitigation system.

HARRISBURG, PA.—The Harrisburg Light & Power Company is contemplating the installation of four new stokers at its plant in connection with the proposed improvements. C. M. Kaltwasser is general manager.

KUTZTOWN, PA.—The Borough Council is considering calling an election to submit the proposal to appropriate \$15,000 for the completion of the municipal electric-light plant.

SCRANTON, PA.—Plans have been prepared for the erection of the Johnson School, Richmond Hill, Scranton, a three-story school building, 40 ft. by 160 ft., to be used for manual training work. Fred Nelson, Connell Building, is architect.

BALTIMORE, MD.—Contract has been awarded by the Consolidated Gas, Electric Light & Power Company to the Cowan Building Company, 106 West Madison Street, Baltimore, for the construction of a substation on Post Office Avenue.

MARLINGTON, W. VA.—The municipal electric-light and water plant was recently destroyed by fire, leaving the city without electrical service. The plant, it is understood, will be rebuilt. Frank King is manager.

SWITCHBACK, W. VA.—The central power plant of the Appalachian Power Company, which has been supplying electricity to approximately 81 mines in the Pocohontas and New River coal fields was recently destroyed by fire. The company, it is understood, will rebuild the plant.

WASHINGTON, D. C.—The erection of a three-story building on F Street near Seventeenth Street has been authorized by the War Department for use of telephone system of the department. A. D. Scovel will be in charge of the service.

WASHINGTON, D. C.—Bids will be received by the United States Reclamation Service, Department of the Interior, Washington, D. C., until Feb. 5 for furnishing electrically-operated drag-line excavators for the North Platte, Neb., project.

WASHINGTON, D. C.—Bids will be received at the office of the chief of Bureau of Yards and Docks, Washington, D. C., until Feb. 11 for furnishing under specification (2786) electrically-driven capstans at the Norfolk and Philadelphia navy yards. The cost is estimated at \$110,000.

WASHINGTON, D. C.—Bids will be received at the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., for furnishing at the various navy yards and naval station supplies as follows: Brooklyn, N. Y., Schedule 1665—Miscellaneous plain interior-communication cable; Schedule 1664—15,000 ft. single-stranded, rubber-covered wire. Puget Sound, Wash., Schedule 1663—16,000 ft. single-conductor lighting and power wire, 13,000 ft. two-conductor lighting and power wire.

North Central States

DETROIT, MICH.—A permit has been granted to Esselstyn, Murphy & Hanford to erect a power house on Livernois Avenue for the Lincoln Motor Company, to cost about \$100,000.

EATON RAPIDS, MICH.—At an election held Dec. 31 the proposal to issue \$30,000 in bonds for the purchase of the water power at Eaton Rapids and Smithville on the Grand River, 2 miles distant, was defeated. This is the second time the voters have defeated the bond issue.

MARQUETTE, MICH.—Arrangements have been made by the City Commission to employ an engineer to prepare plans and estimates for the construction of an addition to the hydroelectric power plant on Dead River, to cost approximately \$75,000. Charles Retaillic is superintendent of the municipal light and power plant.

PIQUA, OHIO.—Owing to the request of the government to conserve fuel, Mason H. Lytle, local manager of the Dayton Power & Light Company, has asked the City Council either to revoke or hold the contract on file for the proposed ornamental lighting system in Piqua until conditions are changed.

YOUNGSTOWN, OHIO.—The Ohio Public Utilities Commission has granted the Mahoning & Shenango Railway & Light Company permission to issue \$2,000,000 in bonds, the proceeds to be used for improvements to be made to its system during 1918.

HODGENVILLE, KY.—The Hodgenville Lighting Company is planning to install an ice plant this spring. C. L. Herrin is president.

MAYFIELD, KY.—The water and light plants of the Mayfield Water & Light Company have been purchased by the city of Mayfield, which will take over the property March 31. C. A. Orr is superintendent of the Mayfield company.

STURGIS, KY.—The Sturgis Electric Light Company has recently installed a 200-kw. Westinghouse synchronous motor-generator set, 2200 volts, alternating current, 250 volts, direct current. Sherman Melton is electrical engineer.

WHITESBURG, KY.—The Kentucky River Power Company of Hazard is contemplating extending its electric transmission line from Hazard to Whitesburg.

AKRON, IND.—The Akron Light, Heat & Power Company is contemplating building an automobile storage battery charging and repair station. Karl B. Gast is secretary.

AURORA, IND.—The Indiana Public Service Company has erected 9 miles of 33,000-volt transmission line to connect with the line now being erected by the Union Gas & Electric Company of Cincinnati. The company expects to purchase energy for its system in Aurora and close down the local plant. C. B. Hanna is manager.

GARY, IND.—The Gary Heat, Light & Water Company, controlled by the United States Steel Corporation, is building a new 300-kw. substation and transmission line. F. W. Van Sise is superintendent.

HOPE, IND.—Improvements are contemplated to the Pulse & Porter electric-light plant, including resetting boilers, repairing engines, installing Fairbanks-Morse oil en-

MARION, IND.—The Marion Lighting & Heating Company contemplates enlarging its plant during 1918. O. M. Drischel is general manager.

ORLAND, IND.—The Orland Light & Power Company expects to establish an 18-hour service in the near future and to erect some rural transmission lines this summer, and also to improve the water power to its highest efficiency as soon as possible. L. W. Jacob is owner.

ZIONSVILLE, IND.—The motor in the power house of the Zionsville Water & Electric Light Company was recently burned out, leaving the town without electrical service.

CHESTER, ILL.—The office and sales-rooms of the Salline Electric Company were recently destroyed by fire.

CULLOM, ILL.—The Cullom Electric Company is rebuilding all its distribution lines, on which work is about one-half completed. A. G. Walter is manager.

MATTOON, ILL.—The Central Illinois Public Service Company has petitioned the Public Utilities Commission for authority to issue \$500,000 in bonds.

PRINCETON, ILL.—The City Council is considering the purchase of an additional generating unit for the municipal electric-light plant or buying energy from the hydroelectric plant at Marseilles. Clarence Anderson is city clerk.

VERMILION, ILL.—The Town Board is considering the advisability of granting an extension of the lighting franchise of the Terre Haute, Indianapolis & Western Traction Company which has expired.

AKELEY, MINN.—The Cuyuna Range Power Company is installing a 200-kw. three-phase, 60-cycle generator connected to a cross compound, condensing Corliss engine. When improvements are completed (about May 1) the company will establish a 24-hour service in both Akeley and Walker. Series 6.6-amp. lamps will be used for street lighting. M. D. Stoner is president and manager.

BRAINERD, MINN.—The City Council contemplates a new water supply this season, including a new pumping station and equipment and laying approximately 14 miles of new water mains. William Nelson is secretary of water and light board.

GLENWOOD, MINN.—The Glenwood Electric Light, Heat & Power Company is planning to extend its high-tension transmission line to Cyrus this year. E. O. Burrow is superintendent.

HAWLEY, MINN.—The city of Hawley has a two-year contract with the Hawley Milling Company to furnish energy to operate the municipal electric-light plant. At the termination of the contract the city will probably install a steam plant. J. P. Roach is superintendent.

KEEWATIN, MINN.—Plans are being considered for replacing the arc lamps on three city blocks with an incandescent system, using type "C" lamps. A. Bodoh is superintendent of the municipal electric-light plant.

MAYNARD, MINN.—The transmission lines of the municipal electric-light system are being extended within the village limits furnishing electrical service to farmers along the lines. Lawrence A. Sanner is manager.

NEW PRAGUE, MINN.—Improvements are contemplated to the municipal electric-light plant, including the construction of a 100-ft. chimney, 40 in. in diameter at the top, one 80,000-gal. steel water tank to be built on the present tower, which is 80 ft. high. Joseph T. Rynda is superintendent.

BRITT, IOWA.—The Britt Light & Power Company contemplates the purchase of a 100-hp. horizontal return tubular boiler during 1918. L. M. Goodman is president.

DANBURY, IOWA.—The Durst Light & Power Company is considering extending its electric transmission lines toward Mapleton this summer. Mark Durst is manager.

DES MOINES, IOWA.—Bids will be received by the city of Des Moines until Feb. 13 for the construction of a municipal building, including steam heating, electric wiring, one electric passenger elevator, vacuum cleaner, plumbing, etc. The building will be 83 ft. by 172 ft., three stories and basement, and will cost about \$350,000. Frank Jeffries is city clerk.

EARLHAM, IOWA.—The town officials are considering the extension of the municipal electric transmission lines into the farming sections and will require equipment, including poles, wire, transformers, etc. M. A. Thorp is superintendent.

EARLING, IOWA.—The Stinn Implement Company is erecting an electric transmission line into the country, 5 miles out, and will furnish electrical service to country residences in the spring. The company has recently completed a new power station and

the erection of an electric transmission line to Westphalia, a distance of 5½ miles. A. C. Stinn is manager.

HAWARDEN, IOWA.—The municipal electric-light plant was recently damaged by a loose flywheel, causing a loss of about \$4,000.

SIoux CITY, IOWA.—The city clerk has been authorized to ask for bids for an air-lift pumping system for the Main Street pumping station, consisting of nine air-lift pumps, booster, piping, air compressors, engines, etc. The cost is estimated at about \$50,000.

WINTERSSET, IOWA.—Improvements will be made to the municipal electric-light plant, including the installation of a 150-hp. boiler and the erection of a smokestack 125 ft. high. L. O. Klein is manager.

KANSAS CITY, MO.—Initial steps have been taken by the Kansas City Light & Power Company for the construction of its proposed power plant on the Missouri River at the foot of Brooklyn Avenue. The present plans provide for an ultimate generating capacity of 150,000 kw., which with the necessary distributing lines will cost approximately \$15,000,000. The initial installation will consist of two turbines with a rating of 25,000 kw. each and will cost about \$5,220,000. Two intake pipes will be built, each of which will supply the condensers with 200,000 gal. per minute. Each turbine will be equipped with a condenser.

ST. LOUIS, MO.—Contract, it is reported, has been awarded by the Wagner Electric Manufacturing Company for the erection of a new plant, 130 ft. by 500 ft., one story.

ST. LOUIS, MO.—The Union Electric Light & Power Company has applied to the Public Service Commission for permission to issue \$1,500,000 in bonds and \$1,000,000 in additional capital stock.

ST. LOUIS, MO.—Plans are being considered by the St. Louis Malleable Castings Company, Conduit Avenue, for the construction of a new plant, consisting of a machine shop, forge shop, foundry, electric power plant and other buildings. The cost is estimated at \$50,000.

ST. LOUIS, MO.—Bids will be received by the Board of Public Service, City Hall, St. Louis, until Jan. 29 for the installation of four 425-hp., Heine type, water tube boilers, eight automatic chain grates and stokers, coal and ash-handling machinery, erection of brick and concrete stack, 250 ft., with smoke flue connections. Plans and specifications may be obtained at the office of E. E. Wall, water commissioner.

WELLSVILLE, MO.—The electric plant of the Blattan Poultry & Manufacturing Company was recently destroyed by fire. The company also supplied electricity in the town.

BAYARD, NEB.—Bonds to the amount of \$5,500 have been authorized for the installation of a lighting system.

MURRAY, NEB.—The City Council has contracted with the Nebraska City (Neb.) Utilities Company to furnish electricity for commercial purposes for city distribution system.

ASHLAND, KAN.—New equipment, consisting of an 80-kw., three-phase, 60-cycle, 2300-volt generator and a 100-hp. De La Vergne gas engine is being installed in the municipal electric-light plant. O. M. Chinn is superintendent.

BELOIT, KAN.—Improvements are being made to the municipal light and water plant, including the installation of a new filtration plant and erection of an addition to power house. A Custodis radial brick chimney has recently been completed and a 150-hp. boiler installed. New pumping machinery, which has been ordered, will soon be installed. F. A. Darst is superintendent.

CANEY, KAN.—The Kansas Light & Power Company, which recently took over the local plant, contemplates building a new plant this spring. Steam power will probably be used. L. R. MacConnell is president and general manager.

DIGHTON, KAN.—At an election to be held Feb. 4 the proposal to issue \$10,000 in bonds for extensions to the municipal water and light plant will be submitted to the voters.

GARDEN CITY, KAN.—Improvements are being made to the municipal electric-lighting system, including the erection of 1½ miles of power line; installing one 50-hp. and two 25-hp., 2300-volt motors and pumps, to pump the city water. S. E. Austin is superintendent.

GYPSUM, KAN.—The Central Kansas Power Company is extending its electrical service to Kipp. J. F. Keys is secretary and manager.

LINCOLN, KAN.—The City Council is considering the installation of a 250-hp. Diesel engine-driven unit in the municipal

light and water plant soon. A. W. Seng is superintendent.

MCPHERSON, KAN.—New equipment, including a 312-kva. generating unit, directly connected, driven by a Skinner millflow engine and a Union Iron Works 250-hp. water tube boiler is being installed in the municipal electric-light plant. C. F. Kasmussen is superintendent.

NESS CITY, KAN.—The installation of a new 100-hp. Snow oil engine in the municipal electric-light plant is under consideration. A 24-hour service will be established about March 1. Claude Baker is superintendent.

WILSON, KAN.—The town officials are considering taking over the plant of the Wilson Electric Light Company and consolidating it with the municipal electric-light plant.

Southern States

RALEIGH, N. C.—The installation of an additional 200-hp. boiler in the steam heating plant of the North Carolina State College of Agriculture and Engineering is under consideration.

ATLANTA, GA.—The United States government has definitely decided to locate a repair shop at Atlanta, Ga., to cost about \$2,000,000. The Mackie Construction Company of Atlanta will build the plant. Col. Stayer, Forsythe Building, is in command.

PENSACOLA, FLA.—The Pensacola Electric Company is contemplating the erection of a 13,200-volt transmission line to the Pensacola naval station. Thomas J. Hanlon, Jr., is manager.

ALEXANDER CITY, ALA.—At an election to be held Jan. 21 the proposal to issue \$10,000 in bonds for extensions to the municipal electric-light plant will be submitted to the voters.

ATMORE, ALA.—The W. M. Carney Mill Company is contemplating the installation of a 10-ton ice plant, to be operated in connection with the electric plant. Ward Converse is manager of the electrical department of the company.

FOLEY, ALA.—Bonds to the amount of \$3,000 have been voted to build or purchase an electric-light plant.

SOUTH FLORENCE, ALA.—Plans have been prepared by the War Department for the construction of another dam (No. 2) at Muscle Shoals on the Tennessee River, 5 miles from Florence. The plans include a hydroelectric development, the erection of electric transmission lines, etc., to cost approximately \$13,500,000. This development is for the purpose of furnishing electricity to operate the proposed \$30,000,000 ammonium nitrates plant of the government. Contract for dam has been awarded to the J. G. White Engineering Company, 43 Exchange Place, New York, N. Y. M. T. Thompson and P. J. Davis, resident superintendents, South Florence.

CANTON, MISS.—The installation of a surface condenser for a 200-hp. engine and spray equipment for cooling in the municipal electric-light plant is under consideration. John T. Sharp, Jr., is manager.

CLARKSDALE, MISS.—The Water and Light Commissioners contemplate the installation of a 1000-hp. water-tube boiler and a 1000-kw. turbo-generator; boring now a 13-in. well furnishing 1000 gal. per minute, equipped with a motor-driven Layne pump. W. W. Pointer is superintendent.

CLEVELAND, MISS.—The Home Light & Ice Company contemplates installing a 75-hp. boiler this spring. E. J. Nott is president.

GREENWOOD, MISS.—Estimates are now being secured by the Light and Water Works Commissioners on a turbine and centrifugal pumps. Roy Stott is manager.

HOUSTON, MISS.—The city of Houston expects to install a new plant complete. The equipment will consist of an 80-hp. crude oil engine, directly connected to a 60-kva., three-phase, 2300-volt, revolving field motor and switchboard. A. G. Atkinson is superintendent.

POPLARVILLE, MISS.—The municipal electric light plant and water works system has been leased to the Poplarville Light & Water Company. New equipment, including a 60-hp. Remington oil engine and a 16 by 12-in. Chicago Pneumatic Tool Company compressor, is being installed in the plant. Crude oil and distillate will be used as fuel. F. F. Kidwell is manager.

WIGGINS, MISS.—The City Council is contemplating improvements to the electric-lighting and water-works systems.

BLYTEVILLE, ARK.—The Missouri & Southeastern Utilities Company contemplates replacing all 16-cp. street lamps with

100-cp. lamps. J. G. Fisher is superintendent.

HOPE, ARK.—The installation of crude oil engines in the municipal electric-light plant is under consideration. Charles M. Richards is manager.

DE RIDDER, LA.—Orders have been placed by the De Ridder Light & Power Company for a 150-kva. General Electric generator to be directly connected to a 16-in. by 16-in. Corliss-Ball engine. The company has been granted a 25-year franchise. W. F. McCammon is secretary.

DONALDSONVILLE, LA.—The Water and Light Commission is building reservoirs and drilling deep wells for the water supply. J. W. Byrnes is manager.

NEW IBERIA, LA.—Improvements contemplated by the City Council this year include the installation of an ornamental-lighting system and the purchase of oil engines for the municipal electric-light plant. Lawrence F. Villermin is manager.

NEW ROADS, LA.—Improvements are contemplated to the municipal electric-light plant in the near future, consisting of the installation of a crude-oil engine to replace steam power and drilling a deep well. R. Vignes is superintendent.

BARTLESVILLE, OKLA.—The Crystal Ice & Storage Company is planning to rebuild its plant soon, which was destroyed by fire some time ago. The new plant will have three times the capacity of the old one.

CANADIAN, OKLA.—The City Council is considering calling an election soon to submit the proposal to issue bonds for the installation of an electric-lighting plant and water works system.

MIAMI, OKLA.—The capital stock of the Empire District Electric Company of Oklahoma has been increased from \$30,000 to \$200,000. The company is controlled by the Empire District Electric Company of Missouri.

PRAGUE, OKLA.—The City Council contemplates calling an election to vote on the proposal to issue bonds for improvements to the municipal electric-lighting system.

SEMINOLE, OKLA.—Bids, it is reported, will be received by the city of Seminole until Feb. 4 for the construction of an electric-light plant. L. M. Hammon is city clerk.

TULSA, OKLA.—Plans have been prepared by the Southwestern Bell Telephone Company for the construction of an addition to its telephone exchange building at Fourth and Boston Streets, to cost about \$75,000.

AUSTIN, TEX.—The Austin Power Company (Guy A. Collett, receiver), it is reported, will petition the Federal Court for permission to repair the Austin dam. The cost is estimated at about \$100,000.

DALLAS, TEX.—The contract providing for the exchange of power between the Dallas Power & Light Company and the Texas Power & Light Company has been approved by the City Commission. The contract as originally submitted to the supervisor of utilities called for an expenditure of \$350,000 for transmission lines and transforming apparatus, but concessions have been made which will save the local company a total of \$150,000. The contract covers the purchase of 3000 kw. with an increase to 5000 kw. Under the agreement the Dallas company will furnish energy to the Dallas Railway Company for the Oak Cliff and East Dallas lines, which is now supplied by the Northern Texas Traction Company.

DENISON, TEX.—The Texas Electric Railway Company is planning to erect a passenger station and repair shop.

TEXARKANA, ARK.-TEX.—Bids will be received in duplicate, one addressed to J. H. McLain, secretary of board of public affairs, Texarkana, Ark., and one to W. J. DeFee, city secretary, Texarkana, Tex., until Feb. 5, for the construction of a joint sewage disposal plant, consisting of two settling tanks, two sprinkling filters, two sludge beds, two pumping stations, together with necessary appurtenances. Plans, specifications, bidding blank may be obtained on application to L. T. Peden, consulting engineer, 2204 Chartres Street, Houston, Tex.

Pacific and Mountain States

CHEHALIS, WASH.—O. E. Anderson has petitioned the City Council for a franchise to supply electricity for lamps and motors in Chehalis for a period of 30 years. The ordinance has been given its first reading and provides for the installation of the new plant within nine months after the franchise is granted.

work is being done by the Inter-Mountain Power Company toward the immediate erection of a high-tension transmission line from the Long Lake plant of the Washington Water Power Company in the north-east corner of Lincoln County to the Milwaukee Railway, at a point about 12 miles south of Odessa. The Inter-Mountain company has the contract for furnishing energy to the Milwaukee Railway for operating its lines between Othello and Puget Sound cities.

PORT ANGELES, WASH.—The Parafine Companies, Inc., of Port Angeles, which are constructing the Crescent Card factory, at a cost of \$200,000, have announced that the plant will be operated entirely by electricity, supplied by the Washington Power & Manufacturing Company from its plant located on the Elwha River, 7 miles from Port Angeles.

SEATTLE, WASH.—A permit has been granted to the Erickson Shipbuilding Company, 4200 Iowa Avenue, for the erection of a power house, to cost about \$5,000.

SEATTLE, WASH.—Specifications submitted by J. D. Ross, superintendent of lighting, for incandescent lamps for the year 1918, have been approved by the Board of Public Works. Approximately 500,000 lamps will be purchased this year.

SEATTLE, WASH.—The Board of Public Works has approved the revised specifications submitted by J. D. Ross, superintendent of lighting, for the development by the city of Seattle of the Diablo Canyon power project on the Skagit River, which call for separate bids, instead of a lump sum for the plant and transmission lines. The original ordinance has been amended and now authorizes an expenditure of \$5,000,000 instead of \$3,000,000, and confines the plant to federal domain. The transmission lines have been changed from steel tower construction to wooden pole lines. The date for opening bids for the construction of the \$5,000,000 hydroelectric plant has been set for March 5 by the Board of Public Works.

NORTH BEND, ORE.—The Oregon Power Company is negotiating with the City Council relative to replacing the arc lamps now in use with 100 and 60-watt lamps, which would be extended over the intersections on 8-ft. arms.

SALEM, ORE.—The Mountain States Power Company, organized under the laws of the State of Delaware, has received a permit to operate in Oregon. The company is capitalized at \$5,000,000. Richard Shore Smith of Eugene is representative for this state. The main offices of the company are located in Wilmington, Del.

DURHAM, CAL.—The Durham Light & Power Company is contemplating the installation of a distribution system in about 60 days. J. A. Foster is owner and manager.

GLENDALE, CAL.—Negotiations are under way with the Southern California Edison Company to purchase the Edison system in Tropic and merge with the Glendale system. Tropic has consolidated with Glendale.

LOMPOC, CAL.—The Continental Securities Company, which controls the Lompoc Light & Power Company, has submitted a proposal to the Board of City Trustees offering to sell the property to the city for \$30,000.

LOS ANGELES, CAL.—Additions are being erected to the local shops of the Los Angeles, San Pedro & Salt Lake Railroad Company, consisting of a new pattern shop and structures for coach, engine and tank car repair work. The cost is estimated at about \$100,000.

PALO ALTO, CAL.—At an election held Jan. 5, bonds to the amount of \$66,000 were voted for improvements to the electric-light plant, including the installation of a 500-hp. Diesel engine and a 350-kw. (approximately) electric generator, for which contract will be awarded at once. Frank Kasson is city clerk.

QUINCY, CAL.—The Quincy Electric Light & Power Company is contemplating the purchase of an engine before the next low-water period, to be used as an auxiliary to water power. A. L. and O. P. Payne are managers.

SAN BERNARDINO, CAL.—The construction of a new hydroelectric power plant in Little Bear Valley is under consideration by the Arrowhead Reservoir & Power Company. The plans provide for an initial development of 12,000 hp., to cost about \$2,000,000.

BONNERS FERRY, IDAHO.—The Bonner Water & Light Company contemplates the installation of a Rumsey triplex 375-gal. per minute pump. F. T. Berger is manager.

BOVILL, IDAHO.—Bonds to the amount of \$5,500 have been voted for the installa-

The proposed plant will be installed in the pumping station in which an engine and other necessary equipment will be placed.

JULESBURG, COL.—The Council expects to build a new electric-light plant within the next two years. J. R. Aldrich is superintendent.

MEAD, COL.—The Supply Irrigating Company is reported to be considering the construction of a reservoir in connection with an irrigation project, to cost about \$250,000.

SALIDA, COL.—The Colorado Power Company, it is reported, is contemplating doubling the output of its local plant.

SILVERTON, COL.—Arrangements are being made by the Silverton Electric Light Company for replacing the arc lamps now in use with type "C" nitrogen lamps of 250 cp. Material has already been purchased.

STERLING, COL.—The distributing lines of the municipal electric-light plant are being rebuilt and extended into the suburbs. C. H. Love is assistant superintendent.

WRAY, COL.—The Wray Electric Light & Power Company is contemplating pumping water for the town, using two motors of 15 hp. each, and erecting a transmission line on the country road, about 3 miles, to furnish electrical service to the farmers. The company is now completing the installation of a 140-hp. boiler. M. Williams is owner.

Canada

CALGARY, ALTA.—Bids, it is reported, will be received by the Alberta Hydro-Electric Company of Calgary for the construction of a series of dams for power development along the Bow River. Z. Malhoit, box 1480, Calgary, is consulting engineer.

NIAGARA FALLS, ONT.—Contracts have been awarded by the Hydro-Electric Commission of Ontario for the construction of a 13½-ft. wood-stave flume with turbines and generators for the development of 50,000 hp. (additional) at the plant of the Ontario Power Company. Of this 20,000 hp. will be available in August and the remainder in October.

OTTAWA, ONT.—Bids will be received by John A. Pearson, architect, and J. O. Marchand, associate, Centre Block, Parliament Buildings, Ottawa, until Feb. 5 for elevators and hoist equipment required in the reconstruction of the Parliament Building. Plans and specifications can be obtained at the office of P. Lyall & Sons Construction Company, general contractor, Ottawa.

Miscellaneous

PEARL HARBOR, HAWAII.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until Feb. 25 for construction of a combined post exchange and gymnasium, 50 ft. by 90 ft., and quartermaster's storehouse building, 40 ft. by 94 ft., including the installation of all conduits, wiring, cables, fixtures, necessary for a complete lighting and power system, plumbing, etc. Drawings and specifications (No. 2758) may be obtained upon application to the above bureau or to the commandant of the naval station named.

PANAMA.—Bids will be received at the office of the general purchasing officer, the Panama Canal, Washington, D. C., until Feb. 11, for furnishing steel pipe, transformers, meters, copper cable and wire, conduit, electrical fixtures, slate, brass stuffing boxes, red lead, tackle blocks, etc. Blanks and information relating to this circular (1196) may be obtained from the above office or the offices of the assistant purchasing agents, 24 State Street, New York, N. Y.; 606 Common Street, New Orleans, La., and Fort Mason, San Francisco, Cal.

MANILA, P. I.—Extensive improvements are contemplated to the power plant and street railway system of the Manila Electric Railroad & Light Company, involving an expenditure of \$4,000,000 during the next five years. The proposed plans include the installation of an additional 5000-kw. turbo-generator and other special plant equipment, which will increase the generating capacity of the plant approximately 50 per cent; the construction of new tracks and new track terminals and the reconstruction of old tracks; reconstruction of the overhead trolley system, building 15 new cars and rebuilding old cars, erection of new and additional electric light and power lines and the re-arranging and improving existing lines. The company has decided to enlarge the present steam plant instead of developing a water power on the Caliraya River. The plant is operated by the J. G. White Management Corporation, 43 Exchange

(Issued Jan. 1, 1918)

- 1,251,461. TRANSMISSION-LINE CONNECTOR; Robert A. Becker, Poughkeepsie, N. Y. App. filed Nov. 27, 1916. Improvements.
- 1,251,473. WIRELESS TELEGRAPHY; William M. Bruce, Jr., Springfield, Ohio. App. filed Dec. 8, 1915. Provides means whereby the signals which are usually received on a telephone receiver can be relayed to an ordinary telegraph instrument, such as a sounder or recording device.
- 1,251,475. TELEPHONE-EXCHANGE SYSTEM; Henry P. Clausen, Mount Vernon, N. Y. App. filed Dec. 13, 1916. Apparatus for

Record of Electrical Patents

Notes on United States Patents

1,251,738—Protective System for Transformers

making peg counts in an automatic exchange.

- 1,251,479. CAR-LIGHTING SYSTEM; John L. Creveling, New York, N. Y. App. filed Aug. 7, 1911. Generator may be automatically governed.
- 1,251,495. IMPULSE-SENDING MECHANISM; Oscar F. Forsberg, Yonkers, N. Y. App. filed July 19, 1917. Specially adapted to be set into a wall set or into an operator's keyboard so that it will be flush with the surface of the wall set or the keyboard and thereby a smooth, even surface may be procured.
- 1,251,503. TWO-WIRE MULTIPLE AUTOMATIC SYSTEM; Charles L. Goodrum, New York, N. Y. App. filed June 21, 1915. Provision of a controlling relay or relays common to a group of lines which are arranged to control the operation of any one of a group of switches having access to the lines of the group.
- 1,251,543. AUTOMATIC TELEPHONE SYSTEM; Jacob W. Lattig, Glenside, Pa., and Charles L. Goodrum, New York, N. Y. App. filed April 25, 1916. System in which a calling subscriber can hold a connection which has been connected to a busy line, the talking strands of which are maintained open, and be automatically connected to said line for conversation when it becomes idle.
- 1,251,544. MACHINE-SWITCHING TELEPHONE-EXCHANGE SYSTEM; Allen E. Lundell, New York, N. Y. Application filed April 26, 1916. Finder having a primary and secondary movement, a circuit arrangement is provided for extending the starter wire to the next wire finder upon the termination of the primary movement of such finder in seeking a calling line, instead of upon the termination of the secondary movement of such finder.
- 1,251,545. TELEPHONE SWITCHING SYSTEM; Frank A. Lundquist, New York, N. Y. App. filed Nov. 15, 1916. Improvements.
- 1,251,562. VACUUM REGULATION FOR RECTIFIERS; Harold A. Newcomb, Wilkesburg, Pa. Improvements.
- 1,251,568. ELECTROPLATING APPARATUS; Louis Potthoff, Flushing, N. Y. App. filed Dec. 14, 1916. Wherein a rotatable barrel supports the articles to be plated in the electrolyte.
- 1,251,569. ELECTROPLATING APPARATUS; Louis Potthoff, Flushing, N. Y. App. filed May 12, 1917. Improvements.
- 1,251,572. ELECTRICAL PROTECTIVE APPARATUS; Charles S. Price, Rutherford, N. J. App. filed Nov. 13, 1916. Improvements.
- 1,251,578. SHAPING MACHINE; William E. Riecken, N. Y. App. filed Nov. 1, 1916. Relates to the shaping of parts of solid conducting material, and more especially to the shaping thereof while heated to facilitate working.
- 1,251,594. RHEOSTAT AND OPERATING MEANS THEREFOR; William A. Turbayne, Niagara Falls, N. Y. App. filed Aug. 19, 1914. Variable resistance having operating means for bringing the resistance into operation under conditions which may be accurately predetermined.

- 1,251,595. GENERATOR-REGULATOR; William A. Turbayne, Niagara Falls, N. Y. App. filed Nov. 23, 1912. For variable-speed generators which will maintain constant potential under wide ranges of speed.
- 1,251,596. ELECTROPNEUMATIC BRAKE; Walter V. Turner, Wilkesburg, Pa. App. filed Dec. 6, 1916. Improvements.
- 1,251,604. RINGING CONTROL SYSTEM FOR TELEPHONE EXCHANGES; Samuel B. Williams, Jr., Brooklyn, N. Y. App. filed Dec. 28, 1915. Improvements.
- 1,251,618. PLUG FOR ELECTRIC CONDUCTORS; Otto Bahls and Theodore Siebert, Jr., New York, N. Y. App. filed June 6, 1914. Improved plug and receptacle therefor.
- 1,251,628. VAPOR APPARATUS; Wilfred T. Birdsall, Montclair, N. J. App. filed May 4, 1915. Provides a cathode, in apparatus of the character specified, which has a low negative-electrode reluctance so as to be self-exciting.
- 1,251,637. TELEPHONE-EXCHANGE SYSTEM; Warren W. Carpenter, Newark, N. J. App. filed Oct. 21, 1915. A register relay circuit for use in telephone-exchange systems of the semi-automatic type.
- 1,251,644. TELEPHONE-EXCHANGE SYSTEM; Henry P. Clausen, Mount Vernon, N. Y. App. filed Dec. 29, 1916. For recording calls.
- 1,251,645. REVERSIBLE BRUSH HOLDER FOR USE WITH DYNAMOS; John L. Creveling, New York, N. Y. App. filed Aug. 19, 1911. Improvements.
- 1,251,651. CORE FOR MAGNETIC COILS; Lloyd Espenchied, Hollis, N. Y. App. filed Sept. 17, 1917. Loading coils and the like.
- 1,251,658. SYSTEM OF CONTROL; Rudolf E. Hellmund, Pittsburgh, Pa. App. filed Sept. 25, 1914. Motor may be accelerated in a uniform and gradual manner, a plurality of efficient operating speeds may be obtained with the use of but few controlling switches, and sparking at the commutator may be obviated at all speeds.
- 1,251,659. CONTROL SYSTEM; Rudolf E. Hellmund, Pittsburgh, Pa. App. filed Jan. 23, 1915. Phase regulation.
- 1,251,660. CONTROL SYSTEM FOR ALTERNATING-CURRENT MOTORS; Rudolf Hellmund, Pittsburgh, Pa. App. filed Nov. 29, 1915. Substantially sparkless commutation.
- 1,251,665. ELECTRIC RIVETING TOOL; Leo Hirsh, Chillicothe, Mo. App. filed July 31, 1916. Provision of a riveting tool, including an impact-receiving riveting head operated by a plunger, which in turn is operated by co-operating solenoid coils, the plunger including a core common to both solenoids.
- 1,251,666. MUNICIPAL TRAFFIC-CONTROL SYSTEM; James B. Hoge, Cleveland, Ohio. App. filed Sept. 22, 1913. Improvements.
- 1,251,669. STROBOSCOPIC DEVICE; Gunnar Jensen, Swissvale, Pa. App. filed Oct. 9, 1915. Used to determine the percentage slip of alternating-current dynamo-electric machines.
- 1,251,682. DOOR RELEASE; Christian Miller, New York, N. Y. App. filed April 15, 1916. Improvements.
- 1,251,688. CONTROL SYSTEM FOR FLYWHEEL MOTORS; John S. Peck, Altringham, and Siegmund Eckmann, Walley Range, England. App. filed Jan. 15, 1913. Improvements.
- 1,251,695. CUT-OUT DEVICE FOR TELEPHONE TRANSMITTERS; Leon E. Rennells, Albany, Ore. App. filed March 31, 1917. Improvements.
- 1,251,700. SHIELD FOR MAGNETIC COILS; Thomas Shaw, Hackensack, N. J. App. filed Sept. 17, 1917.
- 1,251,706. AUTOMATIC REGULATOR; William A. Turbayne, Buffalo, N. Y. App. filed Sept. 25, 1912. Improvements.
- 1,251,707. REGULATOR FOR ELECTRIC GENERATORS; William A. Turbayne, Niagara Falls, N. Y. App. filed April 20, 1914. Railway car lighting.

- 1,251,708. REGULATOR FOR ELECTRIC GENERATORS; William A. Turbayne, Niagara Falls, N. Y. App. filed May 13, 1914. Improvements.
- 1,251,711. STARTER FOR INTERNAL-COMBUSTION ENGINES; George R. Wadsworth. App. filed May 24, 1912. Motor vehicles.
- 1,251,728. TELEPHONE-EXCHANGE SYSTEM; Frederick V. Young, Newark, N. J. App. filed Feb. 17, 1917. Prevents click in the answering operator's receiver.
- 1,251,738. PROTECTIVE SYSTEM FOR TRANSFORMERS; Allan P. Bender, Wilkesburg, Pa. App. filed Dec. 29, 1915. Improvement.
- 1,251,739. ELECTRIC-LAMP SOCKET; Reuben B. Benjamin, Chicago, Ill. App. filed Dec. 9, 1914. Rigid support.
- 1,251,750. TESTING ARRANGEMENT; Henry P. Clausen, Mount Vernon, N. Y. App. filed July 24, 1916. Telephone.
- 1,251,751. SELECTIVE SWITCH; Henry P. Clausen, Mount Vernon, N. Y. App. filed Dec. 29, 1916. A reduction of the trunk-hunting interval.
- 1,251,752. TELEPHONE; Henry P. Clausen, Mount Vernon, N. Y. App. filed Dec. 29, 1916. For facilitating the rapid hunting over a large number of contacts in the making of connections.
- 1,251,754. LIGHTNING ARRESTER; Nicholas J. Conrad, Chicago, Ill. App. filed March 30, 1917. Horn-gap type.
- 1,251,762. CONSTANT-TEMPERATURE-RECORDING INSTRUMENT; John W. Esterline, Indianapolis, Ind. App. filed June 8, 1916. Provides a heating coil which is controlled by a thermostat responsive to the temperature within such case, so as to maintain such temperature substantially constant.
- 1,251,764. ELECTRIC WELDING; Charles H. Florandin and Alan M. Bennett, Westfield, N. J. App. filed Oct. 5, 1917. Arc.
- 1,251,768. TELEPHONE-EXCHANGE SYSTEM; Charles L. Goodrum, Brooklyn, N. Y. App. filed Sept. 11, 1916. Makes it unnecessary to release a connection when the desired line at the connector is busy.
- 1,251,771. ELECTRIC SNAP SWITCH; Monroe Guett, Hartford, Conn. App. filed Oct. 12, 1916. Improvements.
- 1,251,795. SELECTOR SWITCH; Maurice K. McGrath, New York, N. Y. App. filed June 12, 1916. For use in automatic telephone systems.
- 1,251,797. ELECTRICAL SIGNALING SYSTEM; J. L. McQuarrie, Montclair, N. J. App. filed Nov. 15, 1916. Code signaling in telephone-exchange systems.
- 1,251,825. MAGNET THERMAL ELECTRIC LIGHT FLASHER; Michael C. Ryan, Phoenix, N. Y. App. filed June 29, 1914. Automatic.
- 1,251,827. BRUSH FOR ELECTRICAL MACHINERY; Edmund O. Schweitzer, Chicago, Ill. App. filed Feb. 8, 1915. Improved

1,251,754—Lightning Arrester

brush and holder for securing a maximum bearing surface between the brush and the moving surface.

- 1,251,835. BRUSH-RAISING DEVICE; William Strutt, Pittsburgh, Pa. App. filed Dec. 18, 1914. Applies particularly to means for temporarily raising brushes out of engagement with the commutator cylinders thereof.
- 1,251,845. BRUSH-HOLDING DEVICE; Lawrence W. Turnbull, Wilkesburg, Pa. App. filed Nov. 6, 1914. Permits of relative adjustment of the pressures on opposite sides of the brush to prevent tilting thereof with its consequent bad results.

Electrical World

The consolidation of ELECTRICAL WORLD, ELECTRICAL ENGINEER and AMERICAN ELECTRICIAN

New York, Saturday, February 2, 1918

Number 5

Remove Not the Ancient Landmarks

FAILURE to uphold the traditions of an industry, especially if they constitute the foundation on which success of the industry depends, can lead to but one thing—disaster. This is a truism generally recognized throughout the central-station industry and manfully upheld by the industry in this time of great distress and uncertainty. One public utility, as the nation knows, has been remiss in its duties, and its example may serve as an object lesson to central stations. Railroad congestion has been laid at the door of railroad officials by the president of the Brotherhood of Railroad Trainmen, who maintains that if the road companies had directed their efforts toward keeping trains over the roads there would not have been such congestion as is in effect now on all of the roads and particularly at the Eastern terminals. There is one part of his statement, however, which tops all the rest, and this should serve as a beacon to warn other utilities of the rocks and shoals which might wreck them. Indifference of the railroad operating heads, coupled with an apparent desire to teach the public an object lesson concerning the need for increased rates, had been noticed by seasoned railroad employees for months, according to their leader, and general opinion prevails among them that the object lesson which the railroads attempted to teach got out of their control. Whether or not this is a fair assessment of the case we do not presume to say, but if it represents the mature opinion of old railroad employees it is a severe arraignment. It also brings into relief the fact that if in slighting service the purpose was to show the necessity of increased rates the railroads were playing with fire. The lesson which this situation brings home to the central-station industry is immediately apparent. We do not believe that electric utilities contemplate detracting by one iota from their tradition of excellent service. To do so would be suicidal. But if there be any who contemplate such a thing we commend to their prayerful consideration the example of the railroads.

Planning for Wider Markets After the War

WHILE we must ever keep in the forefront the vital necessity of winning this war, we ought not to be unmindful of the day when nations shall beat their swords into plowshares and their spears into pruning hooks. To short-sightedness and unpreparedness we owe much of our present muddle. We have had object

lessons enough; shall we employ them to our profit and the nation's gain? If our wheels of industry are to be kept turning after peace is declared, we shall need a fair share of the world's trade. This is as patent as it is potent. Ships we will have, and American manufacturers should see to it that they shall have the markets and freight to keep these ships always on the high seas. Germany, the arch enemy, somehow finds money and time to plan for business conquests. England, despite her enormous war burdens, retains her grip on foreign markets. The Scandinavians and Dutch ply their overseas trade assiduously, and shall we be found wanting in the crucial commercial test of coming worldwide competition? We are enormous producers and also users of electrical equipment, but we also need to spread the gospel of electricity to other lands. It is a duty we owe to civilization. It is also an obligation we owe to our industry. If we are to succeed, plans must be made at once, for the task is not easy, although the reward is great. Moreover, the plan need not and should not interfere with the successful prosecution of the war. England has established an intelligence system to supply her industries with trade information from all parts of the world. We should do likewise.

Calibration of Power-Factor Meters by Direct-Current Methods

THE polyphase power-factor meter of switchboard type is an instrument designed to indicate the instantaneous power factor of the polyphase system to which it is connected. As ordinarily constructed, its series coil is connected in one line only of the system, and its indications are only to be regarded as correct so long as the system remains balanced. A considerable degree of unbalancing is likely to affect prejudicially the accuracy of the indication.

When such an instrument is assembled and brought to the testing table for either calibration or check, there is usually no difficulty in providing a non-inductive resistance load for the 100 per cent indication, so that this point on the scale is readily determinable. When, however, some other definite point on the scale, such as the 80 per cent point, has to be checked, it is not so easy to provide the load of just this power factor, so that a good deal of adjustment and computation may be needed to bring about the right condition.

An ingenious method for making the calibration test for a well-known type of power-factor meter, using direct currents, is described this week by T. W. Varley. The direct-current strengths in the two movable coils are adjusted according to a definite schedule, so as to provide the same deflecting torque as the corresponding

phase relations in the normal use of the instrument with alternating-current supply. The technique of the calibration should therefore be made relatively very simple and definite, provided that the construction of the dynamometer is such as will produce the proper phase relations of design in alternating-current use.

The English Power Supply Situation

A REPORT recently published in England of the coal conservation sub-committee of the reconstruction committee sets forth in unmistakable terms the reforms necessary in power generation and distribution if the full advantage of electric supply is to be realized. The situation in England is different only in degree from that which exists here, and hence the conclusions of the committee may be taken seriously to heart. In the United States there have grown up a number of great hydroelectric networks which are very important sources of power supply. There have also been organized central-station enterprises on an unprecedented scale which do within areas as yet somewhat limited and with steam as the chief motive power much the same valuable work that the hydroelectric systems can accomplish. But, admirable as all this is, much more remains to be accomplished. The hydroelectric systems need to be developed still further. They must take in all the available water powers within the area covered, including those on the public domain which we hope will soon become available, and must make their distributions so complete and far-reaching that there shall be small excuse for fuel consumption within the areas served. The great steam-supplied systems must go on, as they are now indeed doing, to bigger things, to the building of what the British committee calls superstations, to the abandonment of those which are inefficient, to the consumption of coal when possible at the mine's mouth, and to the more complete development of their service so that no small and inefficient plant shall find economic opportunity for existence.

The British situation as disclosed in this report is in some respects a very unfortunate one. The total supply is divided, despite the modest area involved, between some 600 independent private and public undertakings having an average capacity in power stations of only about 5000 hp., hardly a quarter of that which can well be utilized in a single generating unit. The situation has been rendered more difficult by the large number of municipal plants, some of them very well handled within their limitations, but organized without sufficient reference to the securing of good conditions of generation. There has been an unhappy tendency, brought about by municipal enterprise, toward building plants in most unsuitable places merely to get them within the jurisdiction of the respective municipal authorities. The result has been that not a few large plants, supplying cities of several hundreds of thousands of inhabitants and large industrial needs, have been located where there is no proper supply of water for condensing purposes and have been driven to the use of cooling towers. The large number of municipal enterprises has hampered the development of those under private management, thus still further complicating a bad situation. The unification of existing systems is no easy matter, for the local plants vary greatly in character, distri-

bution voltage, facilities for linkage with distribution lines, and, even when these exist, in the fundamental matter of frequency. There is in Great Britain little such tendency toward standardization of frequency as is found in this country, no less than ten frequencies actually being in use in the British plants.

It has been repeatedly proposed in England that bodies should be created to deal with bulk supply, which the existing undertakings would draw for anything beyond their present capacity. This is a step in the right direction, but the tendency for local bodies to cling to their pet stations will stand in the way of rapid reform, and unless existing stations could be operated on a comprehensive plan they would not be of much use for standby and peak-load service. In other words, for gaining the advantages of bulk supply common control is a fundamental necessity. The logical answer to the grave economic questions involved is the organization of a unified power system at least for each industrial district, probably ultimately involving interconnection over the whole of England. The recommendations of the committee are that there should be a single authority for each of the districts, of which a tentative distribution of interests would indicate sixteen, each controlling a single plant. These plants should be placed on important waterways, on agricultural sites and with good transport facilities. Furthermore, these sites should be large enough to allow the installation of by-product plants to secure the salvage of valuable material from the coal and to accommodate the electrochemical industries which year by year will require a larger and larger supply of cheap power. The "super-power" plants should be erected, with capacities of not less than 20,000 hp. and very likely up to 50,000 hp. These great stations would ultimately take over the whole electric supply in their respective districts.

To the end that some progress may at once be made the committee recommends the appointment of a board of electricity commissioners with full powers to deal with the electricity supply situation throughout the country and authorized to stop the extension or multiplication of uneconomical stations; to arrange for taking over the generation, transmission and main distribution system in each of the districts, putting in charge of a new district body; to standardize for each district frequency and voltage, and to settle for each district what form of undertaking should be charged with the actual administration of the work. This is a large and serious program, not to be carried out without many difficulties of detail. There is one fortunate circumstance in the situation, however, in that there is one authority—to wit, Parliament—which stands supreme in administration. Many minor questions have to be settled by cautious deliberation over all circumstances, but the fundamental proposition is thoroughly sound. If carried out, the committee estimates that the saving in fuel alone would be more than 1,000,000 tons per annum based on the present use of power. This quantity must rapidly increase as industrial development goes on after the war is over and it is well that the problem is being now taken earnestly in hand. We in this country may well heed the lesson of this preliminary investigation, for much as we have done we have as yet gone but a little way toward the general distribution of power on a scale commensurate with the needs of the future.

Power and Compressor Service

OTHER of Professor Clewell's useful papers appeared in the last issue, giving some of the characteristics of the power requirements of fans and other apparatus for producing movement of air. Apparatus of this kind varies very radically in type with the service for which it is applied. The actual characteristics of the service vary enormously with the requirements to be met. Ordinary fans of the type familiar to every one have for their special function the movement of a large bulk of air at relatively very low pressure. For low static pressure blowers of the familiar centrifugal type are commonly used, and for high pressures the two- or three-stage units built along the general lines of the reciprocating steam engine. It is to the first class of apparatus that Mr. Clewell has particularly directed attention. All such apparatus has one common characteristic in that the power required varies very much with the speed, practically as the cube of the speed for a given area of discharge opening. Consequently the starting torque is very slight, which separates blower service from almost every other variety of motor drive. The efficiency of the apparatus does not vary to any material extent with variations in speed, but has an almost unique characteristic. The light starting torque greatly simplifies the equipment of motors and lessens the severity of their sudden requirement for full power at the moment of starting.

Almost any sort of motor is, therefore, available for blower service, and in particular single-phase alternating-current motors, often looked at askance on account of their low torque at starting, serve admirably in driving fans and blowers. Induction motors of the squirrel-cage kind are entirely adequate for this service. If the supply is direct-current either shunt or series motor may be used, the former being generally preferred. The control of fan and blower motors is obviously a very simple matter, the smaller sizes requiring no more than a connecting switch. Large machines should have at least a starting rheostat and, and then under exceptional conditions an overload relay. Only in high-duty compressors is there special reason for any elaboration of the starting equipment, such as is common with other motors. As the speeds required for rotating blowers of every sort are rather high, the connection of the motor is very often practicable through the best speed of fan may not agree well with the quasi-synchronous speeds of alternating-current motors. Large blowers should generally be planned for direct connection, while belting is very often convenient in the smaller sizes. It is perfectly practicable to use either method, and either can be made silent. An important characteristic in much ventilating work is that all machines have some advantage in this respect

when the fan speed is relatively low. It takes a good deal of finesse on the part of the designer to secure a silent fan of respectably large output and advantageous speed, but the trick can be turned successfully. It must be seen that the requirements for fan and blower motors are easy, but rather highly specialized, and Professor Clewell's article gave a very comprehensive view of the general conditions which must be met.

Simplifying Transmission-Line Calculations

IT IS now well recognized that in the theory of the transmission of electrical energy over wires of any length, whether they are merely carried across a street or whether they are carried across a continent, the fact that the resistance, inductance, capacitance and leakage of the wires is ordinarily distributed with reasonable uniformity causes the impedance, voltage, current and power at any point along the line to be proportional to simple functions of a certain hyperbolic angle which applies to that point. The magnitude of this angle depends not only upon the frequency of the alternating current supplied to the line but also on the load or loads which may be applied at the motor station or stations. For the low-frequency power transmission and distribution the hyperbolic theory has very little practical importance unless the line is very long and the ordinary Ohm's law computations are nearly enough applicable for practical purposes. At telephonic frequencies, however, lines of ordinary length have to be treated in theory by the use of hyperbolic functions, if the numerical results are to remain simple and easily obtained. At the very high frequencies of radio operation even the shortest lengths of line come under the natural dominion of these functions.

The article in this issue by T. A. Wilkinson on "Simplifying Transmission-Line Calculations" presents certain diagrams in an "exponent chart," with the aid of which the computation of the voltage and current along the transmission line may be determined with ordinary tables. The method employed differs in interesting details from those which have thus far been presented. The relative advantages of the different methods for arriving at an assigned set of required results are always a matter for discussion. The method presented by Mr. Wilkinson is applicable to determining the electrical conditions at any point along the power-transmission line. If, however, only the conditions at the two ends of such a line are desired, it seems likely that the computation of the equivalent π of the line would be swifter. It would be interesting to have comparisons presented as to the brevity of the various methods now known for determining the electrical working conditions of a given long line at a known terminal load and at a known frequency.

COILS of wire are used for so many purposes in electrical engineering applications that H. B. Dwight's article on the self-inductance of long coils, which will appear in the next issue of the ELECTRICAL WORLD, should be of interest to many readers. The writer develops a formula which is very simple to apply. Another feature of the Feb. 9 issue will be an article on a bulk-supply generating sta-

The Coming Issues

tion situated at the mouth of a coal mine and operated jointly by two electric service companies. Arrangements which have been made to make joint operation successful will be outlined and particular attention will be directed to the mechanical features of the plant. Other articles which will appeal to different types of engineers will also be presented next week.

Rate Increases to Follow High Cost of Coal

Prospect of Permanent Higher Level of Fuel Cost Leads Companies to Plan Ahead
So That Advances in Rates May Offset Increase in Production
Expense—Other Factors in the Outlook

THE final outcome of tremendous coal demand upon the market price of that commodity has a direct bearing upon rates of electric central stations. As shown in the ELECTRICAL WORLD, many companies have advanced rates to reimburse themselves in part at least for increased coal cost. They asked the consumer to share the heavier operating expense. In some cases the feeling of executive officials has been that acute coal conditions were temporary and that when they became normal again electric rates could be restored to their former level. This is in part the theory underlying the coal clause which has been introduced by many properties to raise or lower rates automatically with increases or decreases in coal cost. This general idea that coal conditions were temporary has led certain companies to refrain from advancing rates.

In many properties, however, and particularly the small stations which have limited business and earnings and limited possibilities for expansion, the burden of coal cost is too heavy to be taken into the accounts without an increase corresponding in some degree in rates. These properties lack the diversity of business of the large systems and they are without reserves to withstand a sharp enlargement of operating expense; unless they can definitely transfer such expenditures as those the industry faces for coal they are compelled to write red-ink balances in their accounts or show a reduced surplus.

WHAT OF THE FUTURE?

Beyond the immediate meaning of higher coal cost and the higher rates established in a large number of cities throughout the country is the question of what the future holds. Most companies reached in the ELECTRICAL WORLD canvass are of the opinion that the great upheaval in coal conditions will cause a permanently higher price level for that necessary commodity. The steam central stations relying on coal for fuel are not alone in this conclusion; it is held also by companies using other forms of fuel in whole or in part, such as crude oil or natural gas. From this premise the conclusion of many companies is that future electric rates will undoubtedly be higher. Against this there is, of course, the possibility of more efficient generating apparatus and practices, but that raises also the question of the economic desirability under existing conditions of scrapping existing plants to provide for the possible new inventions. It brings up the question of financing expenditures of this nature, which is serious at this time and will probably so continue.

"The coal situation," writes one general manager in a statement which effectively presents the views of many companies, "in my opinion is going to affect operating conditions, rates, etc., for a material time. Even though the war should cease to-morrow, the era of low prices for coal and labor is past for some time to come. The result is going to be greater operating costs and a necessity for the increase of rates to match those costs.

Coal and labor are not going to be the only determining factors in this matter, as I feel it will take a considerable time for all of the other forms of material which we use in our work to return to anything comparable in price with that which prevailed before July 1, 1914."

The following opinions also point to future higher rates:

We are of the opinion that operating expenses of utilities will be seriously affected in the future by the increase of coal, and that the only answer is to proportionately advance the rates.

In our opinion, unless central stations get some relief being allowed to increase their rates, they will be in a serious financial condition before the end of 1918. The advance in cost of coal has been tremendous. Where there is not a state regulatory body the federal government should give the companies relief by allowing rate increases. The companies believe these results should come indirectly through the state and federal fuel administrators.

We believe that the coal situation will necessitate substantial rate increases of a temporary nature and that the rates will have to carry some permanent increase. We believe that the central-station operators will be able to finance these increases with comparative ease and also without undue risk.

It would seem to us that while the government is endeavoring to control the fuel situation and since it cannot increase the price that we are compelled to pay, it should also authorize the state public utility commissions to raise temporary increases to all utility companies in the form of a surcharge or war tax, until such time as appraisal hearings could be had in each case, when final adjustment could be made.

We are arranging to ask for an increase in all our rates, based on the increased cost of production. The outlook for the winter is serious. Being located in the vicinity of a number of mines, our plant is especially well supplied with coal, but if the government continues to increase the price, as it has been doing, we do not know where we will land.

One manager, feeling that it is difficult to forecast the future coal situation, is "more or less of the opinion that after the severe strain has passed coal prices will necessarily drop, but under the present tension it will be necessary for many plants to increase their rates either temporarily or permanently, in order to take care of increased cost."

Two companies cite the need of making rates high enough to give a return attractive to capital:

The price of coal affects our conditions so seriously that radical changes in all rates will be necessary if the company is to live and expand. No new money can be obtained by extensions or improvements at this time.

In the indefinite future, operating expenses will be much higher, and rates must be increased proportionately in order that service is to be given the public and the necessary proper rate of return on investment obtained, so that the necessary new capital can be secured.

The probable necessity of reducing maintenance outlay as well as of increasing rates is seen by one executive:

"Owing to increased costs of coal, it will be necessary to reduce other costs," he writes, "with probably reduction in maintenance and a general advance in rates. In the long run the former can be brought back normal, but the higher rate charges will probably last for a considerable period until the entire country reaches the general readjustment period after the war."

Closely allied to this thought is the expression of opinion of another manager, who urges the "most economical use of the plant and proper rates."

Similar suggestions, bearing on increased efficiency and economies, follow:

The cost of coal will increase our operating cost in the future. However, this increased cost of fuel will be somewhat offset by the increase in efficiency which will be sure to come with higher-priced coal.

Central stations will simply have to raise the price of their service to consumers in order to meet the increased cost of fuel. Conditions no doubt will be abnormal during the war and for some time after the war. Central stations must meet these conditions with economies, increases in rates and otherwise, quickly changing operating methods, etc., to keep pace with the times.

Development of more economical production methods is the only alternative to a permanent increase in rates in the judgment of one company: "It is our opinion that the price of coal will never decrease as much as it has increased and that in the future coal will remain much higher than it has been in the past, and that rates for electricity will be permanently increased to some extent, unless cheaper methods of production can be obtained."

A general manager, whose great difficulties with shortage make him feel that the fuel outlook for the entire present winter is very gloomy, expresses the hope that the lessons which the country is learning will turn the negligent national water-power policy into positive action. He writes:

There can be only one effect on operating conditions, rates, etc., in the future—that of increased rates for service rendered.

red. This condition emphasizes the need for legislation by our national government providing for the development of water powers. In many instances the development of the water powers throughout the country will control the flow of erratic streams and thereby reclaim hundreds of thousands of acres of the best farming lands in our country. It is quite evident that our government should aid in the development of these streams, as by so doing capital will be attracted for financing these developments and a long step will be taken toward the conservation of our fuel resources.

A president, who believes that many companies cannot continue to operate under present trying conditions, suggests that "a reduction in the number of cars operated by the electric railways is the best solution for reducing expenses and conserving the coal supply."

It is admitted without contradiction that the crisis in the coal situation has given the fine economy of the central station a new prominence. It has given greater recognition to the advantage of large-scale production as a powerful influence in the conservation of coal. Therefore the companies, looking even beyond the widespread acceptance of the economy of the central station as contrasted with the less efficient isolated plant, anticipate still further development of the large producing and distributing units. Significant of the outlook in this direction are the following:

I don't think the price of coal will ever return to the old level, consequently, all utility operating ratios are going to reach a higher average. The net possibly can be increased over former years by the increased volume of business. As all other fuel-using industries are affected by the high cost of fuel, it is going to be easier for the central station to obtain power contracts than heretofore. This will mean the building of larger and more economical plants by the central-station people, and in the end I believe the utilities will be better off.

The present coal situation and the indicated coal situation for the duration of the war is bound to increase the demands upon central stations and upon hydroelectric plants to the extent of capacity of the central stations. They can be loaded up and with proper management can retain the load thus obtained, adding to their capacity later on when prices for machinery are more normal, thereby much more cheaply and quickly increasing the available capacity for generation of electrical power and being able to supply it with much smaller consumption of coal than is possible with isolated plants.

THE WINTER'S PROSPECTS

The prospects for adequate coal supply in the present winter continue to be very precarious, and companies express grave apprehension. Curtailment of activity through the Garfield suspension days will give slight temporary relief. The following expressions of opinion deal with the general conditions of the current winter and do not take into account the Garfield days:

The outlook for 1917-18 was fairly good for our coal supply until the advent of the cold spell during the last eight days and the consequent demoralization of the railroads.

Unless some vigorous steps are taken to stop the accumulation of coal at railroad junctions and terminal points, we can expect to have serious trouble, as, from what information I can gather, the trouble is in the transportation. The railroads cannot handle the traffic and consequently cannot deliver empties to the mines. Pooling will probably greatly relieve the situation.

The outlook for the winter of 1917 and 1918 is anything but pleasant. I do not know what we will do unless central stations have priority of coal.

In our judgment, the outlook is far from encouraging; in fact, we feel that the outlook is a very serious one.

[A continuation of this article to be published next week will deal with other vital phases of the critical coal situation.]

Electrical Features of Joliet (Ill.) Station

Concluding Installment of Article Regarding the High-Pressure Steam Plant of Public Service Company of Northern Illinois—List of the Most Important Equipment

GENERAL and mechanical features of the new high-pressure steam station of the Public Service Company of Northern Illinois were discussed in the issues of the ELECTRICAL WORLD for Jan. 19 and 26. This concluding section will dwell on the electrical features.

In the electrical end of the station there are no radical departures from standard practice like those in the steam end, but the design is interesting nevertheless as representing a studied selection and arrangement of apparatus to give the most efficient and economical operation under the conditions. The fact is that the high economies of the station as a whole will open up a new field for the sale of energy. Many industries which could not be economically served before will now find their own electricity-producing equipment so far inferior in economy to central-station service that it will pay them to buy power. It was the desire to provide for this condition that made the engineers provide for a number of feeders leaving the station at the generator voltage. Just how the ultimate installation of feeders will be divided between 12,000-volt and 33,000-volt is not yet definitely decided. The station is laid out for considerable flexibility along this line.

The fact that the station is really a bulk supply station, so situated with regard to its customers that 12,000-volt and 33,000-volt energy must be sent out, is perhaps the greatest single controlling factor underlying the design. The rating of each of the first two generators is 12,500 kva., 12,000 volts, three-phase, 60-cycle, 1800 r.p.m. This rating is based on a maximum temperature in the armature of 100 deg. C. and in the field of 135 deg. C. with cooling air entering the machine at 40 deg. C. Twelve thousand volts was chosen as generator potential because this is standard in the company's newer plants. The generator windings, which are designed to give each machine 13 per cent inherent reactance, are Y-connected, the neutral point of each being connected through a non-automatic oil switch to a common grounding bus which is earthed through one grounding resistance. Each generator is equipped with a signal indicator and with signal stands. Direct-connected to each machine is a 100-kw., 250-volt shunt-wound interpole exciter. One 100-kw. steam-turbine-driven exciter is also installed as a reserve. Voltage regulation of the generator is controlled by an automatic voltage regulator.

LOCATION OF SWITCHING EQUIPMENT

Most of the electrical equipment for the station is installed adjacent to the turbine room in what is termed the main switch house. It is built integral with the remainder of the station and has equipment on four levels, namely, the basement floor, the main floor, which is on the same level with the turbine room, the second floor and the roof. The basement contains the step-up and step-down transformers, generator field rheostats and auxiliary power bus structures. The switchboard, the

operating room and the brick and concrete 12,000-volt bus structures are on the main floor. The 33,000-volt switching equipment is on the second floor, and the A-frame supports for outgoing lines and the four-tan-sphere-gap electrolytic lightning arresters are on the roof. This arrangement, shown in the cross-section diagram printed in the first part of this article, works out well to keep all leads as short as possible and to keep the heavy transformers at a level where they can be easily handled to and from cars.

From the wiring diagram it will be observed that a double-bus system is employed throughout the station. Each generator may feed through either of a pair of 800-amp., 15-kv. oil switches to a set of sectionalized

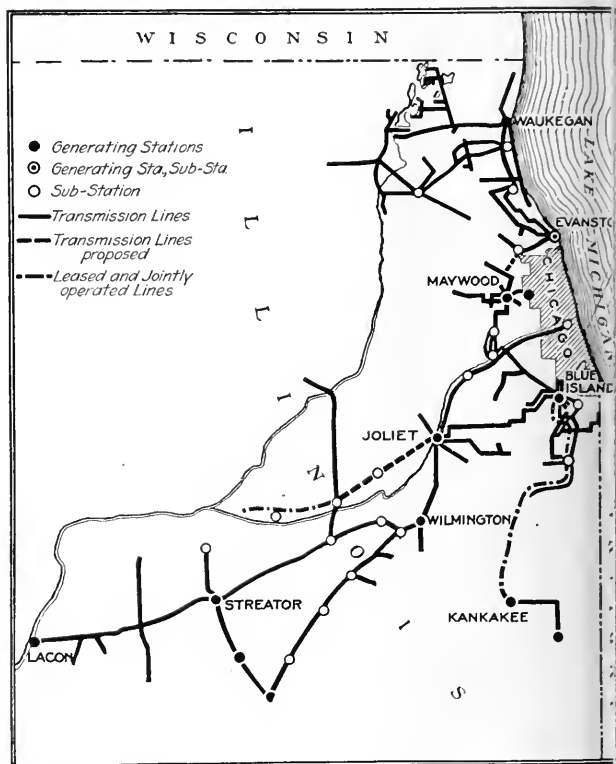

FIG. 1—THE JOLIET STATION IS SITUATED AT THE LOAD CENTER OF THIS SYSTEM

12,000-volt double buses. From these buses two classes of leads are taken off—one, 12,000-volt feeders, and the other, leads to the low-tension side of the step-up transformer. Thirty motor-operated oil switches of the E3 type, ranging from 300 amp. to 500 amp. each in rating, are used to connect these leads to the double bus. From these switches the eight 12,000-volt feeders, which are identical in layout, mostly go into ducts. The other 12,000-volt leads will go to two banks of 12,000/33,000-volt transformers. One bank of three 3000-kw. delta connected single-phase water-cooled transformers is already installed. It is noticeable in this arrangement that no provision is made for spare transformers, it being the belief that open-delta operation can be

successfully resorted to if emergencies arise. The high-tension leads from these transformers go to another double bus through two 45,000-volt, 300-amp. solenoid-operated G-B type oil-circuit breakers. The arrangement of the 33,000-volt circuits is practically identical with that used for the 12,000-volt lines.

The selection of breakers with liberal rating is one of the outstanding features of the electrical design.

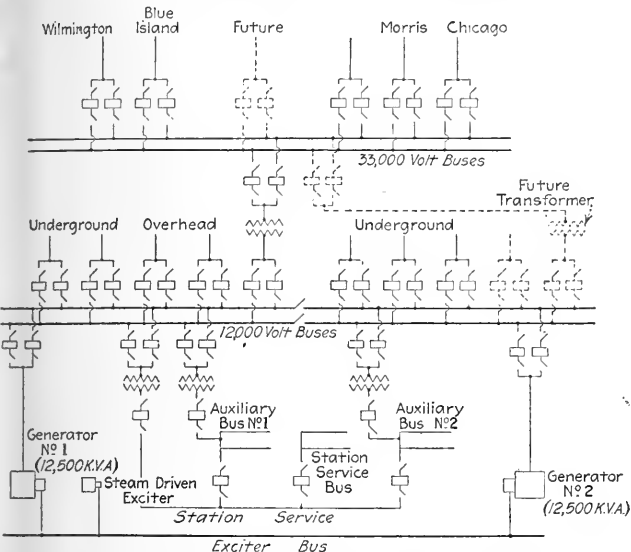

FIG. 2—SCHEMATIC OUTLINE OF PRINCIPAL CIRCUITS IN STATION

This course was followed because it is foreseen that the station will some day be a large one. It is not necessary so far, however, to go to current-limiting reactors to keep within the switch ratings, but space is provided so that reactors can be installed in the future if necessary. Space is provided for sixteen three-phase 33,000-volt switches. The present provision for outgoing 33,000-volt lines will accommodate six. Each of the thirty 15,000-volt and the sixteen 45,000-volt oil switches is arranged so that it can be isolated by six disconnecting switches. Three of each group of six switches are of a special design, which must lock in the open or the closed position before the operator can release the operating rod from the blade. This group of three switches will, of course, be operated first in isolating an oil switch. As a further safety factor, all disconnects are installed in sub-compartments and are hinged on the oil switches so that when the switch is open the blade will be dead.

CENTER OF CONTROL

The control of all electrical equipment, except the auxiliary power, is effected from the operating room, which is in the switch house on the turbine-room floor level. When the building is extended this room will be nearly opposite the middle of the turbine room and separated from it only by a glass partition. From it the operator has a view of the generators and the 12,000-volt switching equipment. Control for the generator is centered in a benchboard, and outgoing feeders are controlled from vertical boards arranged with the benchboard somewhat in the form of a hollow square. The generator circuits are equipped with overload relays, which are ordinarily connected in circuit only during synchronizing. Each outgoing line is equipped with induction-type relays and a polyphase watt-hour meter. Rather liberal use of watt-hour meters has been made

INFORMATION REGARDING MOST IMPORTANT ELECTRICAL EQUIPMENT

GENERATORS (make and rating), 10,000 kw. (80 per cent power factor), 12,000-volt, 60-cycle, three-phase, 11,800-r.p.m. General Electric.

EXCITERS:

Mounted on shaft 110-kw., 250-volt
Turbine-driven reserve unit 100-kw.

OIL-SWITCH EQUIPMENT:

12,000-volt General Electric
45,000-volt Westinghouse

SWITCHBOARD (main) Westinghouse

LIGHTNING ARRESTERS General Electric

Control for the auxiliary power is centered in a vertical board in the turbine room. From this board, which carries the handles of mechanically operated, remotely situated oil switches in the basement of the switch house, any important electrically operated auxiliary can be controlled. The energy for the motor-driven auxiliaries is supplied by three 900-kw., three-phase, 60-cycle, 12,000/480-volt water-cooled transformers in the basement. One of these is a spare. In fact, any one transformer has sufficient rating to carry the entire auxiliary load. The other two transformers each feed a 440-volt bus. These 440-volt buses, of which there are four, are also arranged for emergency interconnection. Each important auxiliary is served by a separate circuit from these buses. The mechanically controlled oil switch is inserted in each of these circuits at the point where the circuit leaves the bus, and the

FIG. 3—TYPE OF SWITCH CELL USED WITH OPERATING MECHANISM MOUNTED OVERHEAD

starting apparatus is located immediately at each individual motor. A 40-amp. (eight-hour rating) storage battery installed for emergencies will have rating enough to take care of pilot lamps, motor and solenoid operated oil switches and a few emergency lamps which are switched on automatically in different parts of the building in case of a failure of the alternating-current

source. This battery is charged by a 15-kw., 110-175-volt motor-generator set. The regular source of energy for lighting is a 40-kw., 440-110-220-volt transformer installed in connection with an automatic voltage regulator to insure long life of lamps. The fixtures are of a gooseneck type.

Safety of the employees and congenial surroundings were features which received special prominence in the design of the station. The turbine-room walls are lined with white and green tile. The engineer has a large, roomy office. Shower baths and locker rooms are provided for the employees and excellent drinking water

is piped from a nearby spring. Houses are being built near the plant for some of the operating force. In addition to the usual equipment, the station contains a machine shop, a storeroom and a fuel engineer's office in which coal, the big factor in power-plant operation will receive close attention. The station was designed by Sargent & Lundy, consulting engineers, assisted by Von Holst & Fyfe, architects. Of the operating company, Samuel Insull is president; Frank J. Baker is vice-president in charge of operation and construction; George H. Lukes, general superintendent, and J. I. Hecht, mechanical engineer.

Simplifying Transmission-Line Calculations

High Accuracy Not Sacrificed Within Extreme Range of Practical Conditions—Method Involves New Equations and Chart Based on Rigorous Formula—Numerical Example

BY T. A. WILKINSON

Electrical Engineer, Westinghouse, Church Kerr & Company, Inc.

THE accurate determination of the voltage, current and power at different points along a transmission line requires, in principle for short lines and necessarily for long lines, the taking into account of the distributed nature of the resistance, inductance and capacity of the circuit. The difficulty and tediousness of the numerical calculations required in using the rigorous formula, involving hyperbolic functions of complex quantities or their equivalent convergent series, have proved a great deterrent to its use, and approximate methods of varying degrees of accuracy have been devised and largely depended on in the solution of practical problems. The simpler approximations are applicable only to quite short lines of moderate voltage, while of the more elaborate methods suitable for longer lines it can only be said that they are somewhat less cumbersome and tedious in application than the rigorous formula.

In the following is presented a new transmission-line formula developed by the writer, by which, with the aid of a simple chart, the calculations are greatly simplified and shortened and the results of the hyperbolic formula obtained in a few minutes, with about the accuracy of a four-place logarithm, for any conditions within the conceivable limits of practical operation. In addition to its simplicity, accuracy and convenience for numerical calculations the formula is inherently instructive and, owing to its unique form, possesses a number of advantages for practical design of circuits and the general investigation of transmission-line characteristics.

DERIVATION OF THE FORMULA

The hyperbolic formula giving the exact relation between the voltage and current at two points along a transmission line, expressed in the form most convenient for the present discussion, is as follows¹ where the conditions at the receiving end are known:

$$E_l = E_o \cosh lx + I_o \times z_o \sinh lx \quad (1)$$

$$I_l = I_o \cosh lx + E_o \times 1/z_o \sinh lx \quad (2)$$

where l = distance between the two points in any unit (miles),

$$\alpha = \sqrt{(r + jx)(g + jb)},$$

$$z_o = \sqrt{(r + jx) \div (g + jb)},$$

r = resistance of conductor (ohms per mile)

x = reactance of conductor (ohms per mile),

g = leakage conductance of conductor (mhos per mile),

b = capacity susceptance of conductor (mhos per mile),

E_l and I_l = voltage and current at the sending end
 E_o and I_o = voltage and current at the receiving end

Where conditions are known at the sending end the formula becomes

$$E_o = E_l \cosh lx - I_l z_o \sinh lx \quad (3)$$

$$I_o = I_l \cosh lx - E_l / z_o \sinh lx \quad (4)$$

Assuming the conditions of the first formula, the quantities E_o and I_o in (1) and (2) may be regarded as simple numbers. (I_o in general is not a simple number but this may be disregarded for the present). The other quantities are vector quantities and are to be expressed by complex numbers. For simplicity and brevity in demonstration equations (1) and (2) may be written graphically, as follows, in which form their meaning can be interpreted in terms of simple geometry:

$$E_l = E_o \times \begin{array}{c} \text{Cosh } lx = A \\ \text{---} \end{array} \begin{array}{c} a_2 \\ a_1 \end{array} + I_o \times \begin{array}{c} \text{Z}_o \sinh lx = B \\ \text{---} \end{array} \begin{array}{c} b_2 \\ b_1 \end{array} \quad (5)$$

$$I_l = I_o \times \begin{array}{c} \text{Cosh } lx = A \\ \text{---} \end{array} \begin{array}{c} a_2 \\ a_1 \end{array} + E_o \times \begin{array}{c} \frac{1}{Z_o} \sinh lx = C \\ \text{---} \end{array} \begin{array}{c} c_2 \\ c_1 \end{array} \quad (6)$$

From (5) and (6) the hyperbolic formula, in complex notation, may be written:

$$E_l = E_o(a_1 + ja_2) + I_o(b_1 + jb_2) \quad (7)$$

$$I_l = I_o(c_1 + jc_2) + E_o(c_1 + jc_2) \quad (8)$$

¹See Kennelly, *Transactions A. I. E. E.*, Vol. XXVIII, 1909, p. 695.

The vectors A , B and C and their components a , b , etc., are functions only of the length of line and the quantities r , x , g and b as defined above. When, therefore, the distance l and the frequency and conductor conditions (material, size and spacing) are fixed the vectors and their components become constants which are independent of the voltage and current. The determination of these constants is the troublesome part of transmission-line calculations, and when they are once determined for a given case the calculation of the voltage, current and power at one end of the line for any assumed conditions at the other end is a simple and elementary one.

An approximate algebraic solution for the determination of the line constants has been given by Dr. C. P. Steinmetz.¹ This solution, while quite simple as compared with the rigorous formula, still involves a considerable amount of calculation and the use of trigonometric functions. With the aid of a chart each of the six components, or line constants, a_1 , a_2 , etc., in (7) and (8) can be expressed separately and calculated, independently of the others, by a very simple expression of one term, derived from the hyperbolic formula, as follows:

The coefficients of E_0 and I_0 in equations (1) and (2) may be expressed in the form of convergent series, as follows:

$$\cosh l\alpha = A = 1 + ZY/2! + Z^2Y^2/4! + Z^3Y^3/6! \text{ etc.} \quad (9)$$

$$\sinh l\alpha = B = Z + Z^2Y/3! + Z^3Y^2/5! + Z^4Y^3/7! \text{ etc.} \quad (10)$$

$$\cosh l\alpha = C = Y + Y^2Z/3! + Y^3Z^2/5! + Y^4Z^3/7! \text{ etc.} \quad (11)$$

in which Z and Y are the impedance $(r + jx)l$ and the admittance $(g + jb)l$ respectively for the whole line.

Denoting the total resistance rl , reactance xl , leakage gl and susceptance bl of the line by R , X , G and B_s , respectively, and substituting for Z and Y in (9), (10) and (11) their complex values, it is possible, by developing the series, to express the coefficients in terms of R , X , G and B_s .

Leaving out the intermediate steps in the calculation, the first two terms of the series for each of the component constants are shown below, equation (12) being transposed to show the value of $(1 - a_1)$.

$$1 - a_1 = (XB_s - RG)/2 - [(B_s^2 - G^2)(X^2 - R^2) - 4RXGB_s]/24 + \text{etc.} \quad (12)$$

$$a_2 = (RB_s + XG)/2 - [RX(B_s^2 - G^2) + GB_s(X^2 - R^2)]/12 + \text{etc.} \quad (13)$$

$$b_1 = R - [2RXB_s + G(X^2 - R^2)]/6 + \text{etc.} \quad (14)$$

$$b_2 = X - [B_s(X^2 - R^2) - 2RXG]/6 + \text{etc.} \quad (15)$$

$$c_1 = G - [R(B_s^2 - G^2) + 2XGB_s]/6 + \text{etc.} \quad (16)$$

$$c_2 = B_s - [X(B_s^2 - G^2) - 2RGB_s]/6 + \text{etc.} \quad (17)$$

Leakage is rarely considered in practical power transmission problems, and consideration of its effect will be left for a later supplementary analysis. Letting $G = 0$ and noting that the sum of the second and following terms of (12) to (17) is in each case a function of R , X and B_s , also that $R = rl$, $X = xl$ and $B_s = bl$, equations (12) to (17) may be written as follows:

$$1 - a_1 = (xb/2)l^2 - f_{a_1}(r, x, b, l) \quad (18)$$

$$a_2 = (rb/2)l^2 - f_{a_2}(r, x, b, l) \quad (19)$$

$$b_1 = rl - f_{b_1}(r, x, b, l) \quad (20)$$

$$b_2 = xl - f_{b_2}(r, x, b, l) \quad (21)$$

$$c_1 = -(rb^2/6)l^2 - f_{c_1}(r, x, b, l) \quad (22)$$

$$c_2 = bl - f_{c_2}(r, x, b, l) \quad (23)$$

The line constants are, to a first approximation, equal to the first terms of equations (18) to (23). Now, by varying the exponent of l in any of the equations the first term can be given any value desired. Then by finding the proper exponents in the six equations the first terms can be made to express the exact values of the respective constants for any assigned values of r , x , b and l . The determination of the exponent, when the constant is known, is simple. Thus, assuming $(1 - a_1)$ to have been determined from given conditions, and letting N_{a_1} equal the corresponding exponent,

$$1 - a_1 = (xb/2)l^{N_{a_1}} \\ \log(1 - a_1) = (\log xb/2) + N_{a_1} \log l \\ N_{a_1} = [\log(1 - a_1) - (\log xb/2)] / \log l \quad (24)$$

The exponents for the other constants can be found in a similar way so the values of the constants can be expressed by the following equations:

$$1 - a_1 = (xb/2)l^{N_{a_1}} \quad (25)$$

$$a_2 = (rb/2)l^{N_{a_2}} \quad (26)$$

$$b_1 = rl^{N_{b_1}} \quad (27)$$

$$b_2 = xl^{N_{b_2}} \quad (28)$$

$$c_1 = -(rb^2/6)l^{N_{c_1}} \quad (29)$$

$$c_2 = bl^{N_{c_2}} \quad (30)$$

in which N_{a_1} , N_{a_2} , etc., are variable exponents of the distance l , to be determined for the given conditions in any particular case.

The above equations constitute the new transmission-line formula, and for its practical application it is necessary to find a simple means of determining the various exponents. These are taken directly, without calculation, from the exponent chart presented herewith.

THE EXPONENT CHART

The sole purpose of the exponent chart is the determination of the exponents to be used in equations (25) to (30). Its construction is deduced as follows:

Assuming a circuit with a given material, size and spacing of conductors, the values of resistance r , inductance L and capacitance C per mile of circuit become fixed. This circuit may be called, for convenience, the standard circuit. Assuming, further, a definite frequency and length for this circuit, the quantities x , b and l also become fixed and the component line constants a_1 , a_2 , etc., can be calculated, for the given conditions, from equations (9), (10) and (11). The corresponding exponents N_{a_1} , N_{a_2} , etc., in (25) to (30) can then be calculated as in equation (24). Similar calculations can be made for other frequencies and lengths of circuit within any desired range.

By calculating the exponents for a sufficient number of lengths and frequencies at proper intervals and plotting the results, curves can be drawn from which the exponents for the standard circuit can be determined graphically for any length and frequency desired.

In the exponent chart, here published, the distance curves are straight lines radiating from a common center. The left-hand, or 60-cycle, ordinate in each diagram is a straight line. Mathematically the other

frequency lines are curves, but the curvature in all cases is so slight as to be scarcely measurable. There is also a slight divergence of the frequency lines toward the higher exponent values. This is hardly noticeable.

In making the numerical calculations it was noted that the exponent N_{c_2} for any condition up to 700 miles and 60 cycles is identical within 0.00005 with the decimal part of N_{a_2} . This permits combining the diagrams for these two exponents, the decimal part only of N_{a_2} being the value of N_{c_2} .

THE STANDARD CIRCUIT

The conditions assumed for the standard circuit were chosen with a view to representing intermediate values between the practical extremes that might occur within the intended range of application of the formula. With a view to giving it the widest practicable range of application and usefulness and making it available for the analysis of long and unusual lines, the exponent chart has been constructed for distances up to 700 miles and frequencies up to 60 cycles.

Seven hundred miles was chosen as the logical limit of distance, being approximately a quarter-wave length at 60 cycles, and thus permitting the peculiar characteristics of this particular type of line to be conveniently analyzed. Furthermore, this was the length proposed for the Victoria Falls transmission line in South Africa, which is, as far as the writer is aware, the longest line that has been discussed or investigated as a commercial proposition. Based on these considerations, the values $r = 0.1$ ohm, $L = 2.11$ millihenries, $C = 0.0145$ microfarad, were assumed for the linear constants of the standard circuit per mile of wire, corresponding approximately to a 575,000-circ. mil copper conductor with a spacing of 17.5 ft. (5.3 m.).

ACCURACY OF THE FORMULA

The formula is rigorous for the conditions of the standard circuit, and the exponent chart on which its application depends is accurate to within an exponent value of 0.00005. For other line conditions the exponents are affected to a small extent by changes in the linear constants, r , L and C . The effect on the exponents is very slight for any conceivable changes within the limits of practical design and where not entirely negligible is capable of easy correction by means of the supplementary diagrams on the chart.

The exponents have been calculated for the extreme conditions of every change or combination of changes that can occur in the values of r , L and C , within the following range of materials, size and spacing of conductor.

Material	Copper and aluminum
Size, maximum	2,000,000 circ. mils.
Size, minimum	Varies with l ; fixed by condition
	$R_{max} = 100$ ohms
Spacing, maximum.....	33 ft.
Spacing, minimum.....	Varies with l ; fixed by condition
	$L_{min} = 1.92$; equals 8 ft. at 700 miles, decreasing to 2 ft. at 50 miles

While the detailed analysis and calculations are too long to be included in the present article, the following interesting and practical results are found:

1. The maximum effect on exponents N_{a_2} , N_{b_1} , N_{c_1} and N_{c_2} of any possible variation in line conditions within the above limits is 0.00032, corresponding to a maximum effect on constants a_2 , b_1 , c_1 and c_2 of 0.21 per cent.

2. The maximum effect on exponents N_{a_1} and N_{b_2} of any possible changes in L or C , as affected by size of spacing of conductor, is 0.00050, corresponding to a maximum effect on constant $1 - a_1$ and b_2 of 0.27 per cent.

3. The maximum effect on exponents N_{a_1} and N_{b_2} due to changes in r , is 0.0015 and 0.0035 respectively, corresponding to a maximum effect on $1 - a_1$ of 0.3 per cent and on b_2 of 1.4 per cent.

4. The effect of changes in r on exponents N_{a_1} and N_{b_2} is practically independent of the frequency.

The effect of changes in r on exponents N_{a_1} and N_{b_2} is shown, and correction made therefor by means of the supplementary diagrams on the exponent chart. The effect of and correction for any value of r is found on the bottom scale vertically below the intersection of the value of r on the left-hand scale and the curve for the distance. With this correction provided for, the limit of error is reduced to 0.3 per cent for any condition within the range of the exponent chart.

EFFECT OF LEAKAGE

Leakage being variable and uncertain in value, refinement in calculations of its effect is unnecessary. It is determined with sufficient accuracy by the first terms of equations (12) to (17) in which it occurs, except in the case of c_1 , where two terms are needed for a satisfactory approximation.

From a series of calculations made by the writer the following results are summarized to show the effect of leakage in per cent on the constants of the standard circuit under various conditions. The value of g assumed in the calculations was 0.2725 micromho, or 1/20b.

	$1 - a_1$	a_2	b_1	b_2	c_1	c_2
700 miles—60 cycles	-0.25	+40.3	-28.8	+0.45	-55.0	+0.5
700 miles—30 cycles	-2.12	+40.3	-3.9	+0.45	-to +	+0.5
100 miles—60 cycles	-0.62	+40.1	-0.3	+0.01	-to +	+0.0

From the above it will be seen that leakage affects principally constants a_2 , b_1 and c_1 , its effect on the other constants being negligible under all conditions. Its effect on a_2 is seen to be practically independent of frequency and distance, while the effect on b_1 is only important at maximum distance and frequency. The relatively large effect on c_1 is numerically unimportant owing to the small value of this constant, the most important result in this case being the change in sign at low frequencies and short distances.

With the exception of c_1 the first terms of (18) to (23) are identical with the values of the line constants as calculated by two of the simplest approximate methods that take account of capacity by assuming it to be concentrated at the center or ends of the line. The integral exponents 1, 2 and 3, therefore, correspond to the assumption of lumped capacity, and the differences between these and the actual exponents represent the effect on each component constant of the distributed nature of the resistance, inductance and capacity of the circuit. The relative effect on each exponent is shown by the height of the respective diagrams on the exponent chart (allowing for the different scale of N_{b_1}).

NUMERICAL EXAMPLE

The following example will illustrate the use of the exponential formula in determining the line constants

for a particular case. The solution of complete transmission line problems will be given in a later article.

Assume: Distance, 275 miles; frequency, 60 cycles; conductor, 250,000-circ. mil. stranded copper; spacing, 8 ft.

From wire tables:

$$\begin{aligned} r &= 0.228 \text{ ohm,} \\ x &= 0.753 \text{ ohm,} \\ b &= 0.00000581 \text{ mho.} \end{aligned}$$

From exponent chart:

$$\begin{aligned} N_{a_1} &= 1.9956, & N_{b_2} &= 0.9909, \\ N_{a_2} &= 1.9901, & N_{c_1} &= 2.9941, \\ N_{b_1} &= 0.9798, & N_{c_2} &= 0.9901. \end{aligned}$$

From logarithmic tables:

	CONSTANT					
	$1-a_1$	a_2	b_1	b_2	c_1	c_2
log exponent	0.3001	0.2989	1.9911	1.9960	0.4763	1.9957
lolog 275	0.3873	0.3873	0.3873	0.3873	0.3873	0.3873
lolog 1^N	0.6874	0.6862	0.3781	0.3833	0.8636	0.3830
log 1^N	4.869	4.855	2.390	2.417	7.305	2.415
log r	1.358	1.358	1.358	1.358	1.358	1.358
log x	1.877	1.877	1.877	1.877	1.877	1.877
log b ($\times 2$ for c)	6.764	6.764	6.764	6.764	11.528	6.764
log $1/2$	1.699	1.699	1.699	1.699	1.699	1.699
log h	1.222	1.222	1.222	1.222	1.222	1.222
log constant	1.209	2.676	1.748	2.294	5.413	3.179
constant	0.162	0.0474	56.0	197.0	-0.0000259	0.00151
d_1	0.838	0.838	0.838	0.838	0.838	0.838

Find conditions at the sending end when the above line is delivering 30,000 kw. at 150,000 volts, with unity power factor. Letting P_o and P_i equal kilowatt at receiving and sending ends respectively, the following conditions exist for one phase:

$$\begin{aligned} E_o &= 150,000/\sqrt{3} = 86,600 \text{ volts.} \\ P_o &= 30,000/3 = 10,000 \text{ kw.} \\ I_o &= 10,000/86.6 = 115.5 \text{ amp.} \\ E_i &= 86,600(0.838 + j0.0474) + 115.5(56 + j197) \\ &= (72,600 + j4105) + (6470 + j22,750) \\ &= (79,070 + j26,855) \\ &= 83,500 \\ I_i &= 115.5(0.838 + j0.0474) + 86,600(-0.0000259 \\ &\quad j0.00151) \end{aligned}$$

$$\begin{aligned} &= (96.8 + j5.47) + (-2.24 + j131) \\ &= 94.6 + j136.5 \\ &= 166 \end{aligned}$$

$$\begin{aligned} P_i &= 79,070 \times 94.6 + 26,855 \times 136.5 \\ &= 11,146 \end{aligned}$$

At no load:

$$E_i = (72,600 + j4105) = 72,700 \text{ volts.}$$

$$I_i = (-2.24 + j131) = 131 \text{ amp.}$$

$$P_i = -162.6 + 537.7 = 375.1 \text{ kw.}$$

$$\text{Regulation} = (72,700 - 83,500)/86,600 = -12.5\%$$

$$\text{Efficiency} = 10,000 \div 11,146 = 89.7\%$$

D. C. Calibration of Power-Factor Meters

Resistance Ratio Method Employed to Eliminate Errors Caused by Variations in Voltage, Current and Phase Angles When Alternating Current Is Used

BY THOMAS W. VARLEY

WHEN a three-phase power-factor meter is calibrated by actually adjusting the power factor, it usually requires two voltmeters, one ammeter, one wattmeter and five men to take readings. With variations in voltage and current it is almost impossible to check any point on the scale. These difficulties are easily overcome by using direct current and adjusting the total resistance in the movable-coil circuits so that they will have the relation indicated in the accompanying table. The values given in the table

Without knowing the phase advance of the condenser used in conjunction with the single-phase power-factor meter to be calibrated it is impossible to give the ratio of total resistances which should exist for checking

FIGS. 4 AND 5—SINGLE-PHASE METER CONNECTIONS AND METHOD OF SIMULATING EFFECT OF CONDENSER

FIGS. 1, 2 AND 3—THREE-PHASE POWER-FACTOR-METER CONNECTIONS AND PHASE RELATIONS WITH NORMAL CONNECTIONS AS WELL AS WHEN MOVABLE COILS ARE IN PARALLEL

apply to two-phase and three-phase power-factor meters of the dynamometer type.

given points on the instrument scale. The phase advance caused by the condenser alone is usually over 89 deg., but combined with the coil A may change to 85 deg. Furthermore, single-phase power-factor meters are subject to frequency errors due to the capacity or inductance in the circuit.

The values given in the accompanying table are based on the fact that the deflection of a dynamometer-type power-factor meter is equivalent to the combined torques of the movable coils A and B in the field of the load coil. The torque of each of these coils is proportional to the voltage impressed across it and the cosine of the angle between the load current and the applied voltage. Hence, at 100 per cent power factor the two torques balance. In other words, by adjusting the relation between the currents in the movable coils the resultant torque with direct current can be made to equal any obtained when the instrument is connected to a polyphase circuit with any power-factor load.

For instance, to determine the resistance ratio which should be obtained to indicate 90 per cent power factor (equivalent to cosine of 20 deg. 50 min.) consider the relation between the current in the movable and load coils for a three-phase dynamometer-type power-factor instrument (Fig. 2). In this case the vector positions of the currents in coils A and B (Fig. 2) would be shifted 25 deg. 50 min. clockwise, making the angles between the currents in the movable coils and that in the load coil 4 deg. 10 min. and 55 deg. 50 min. for coils A and B respectively. Under these conditions the torques of the individual movable coils would be proportional to the cosines of these angles, or in the relation 0.9974 to 0.5616. Thus to simulate these torques with direct current, assuming that the normal resistance of circuit CB is R_b and that of AC is R_a , the resistance of circuit CB should be changed to $R_b \times 0.9974 = 0.5616 = 1.77 R_b$.

The ratio of the total resistances of circuit AB and B to obtain other power-factor deflections with direct current can be obtained in a similar manner. However, it will be found that the current through one of the circuits will have to be reversed in addition to changing the resistant ratio to obtain deflections corresponding to power factors of 70 deg. and less (two-phase) and 40 per cent and less (three-phase). This can be done without altering the instrument connections by joining A and B in series, making the current through

TOTAL RESISTANCE* NECESSARY IN MOVABLE COILS TO GET DIFFERENT POWER-FACTOR DEFLECTIONS WITH DIRECT CURRENT (Use about full-load current and about normal voltage to get a good torque. Alternating current or direct current can be used.)

Figures in bold-face type indicate value of shunt needed to produce required current in circuit.

B negative, and connecting a shunt across the circuit, which is to have the higher resistance. Thus, if BC is to have 0.1108 ÷ 0.8047 normal current in the negative direction (as required at 40 per cent power factor), the shunt will have to carry (0.8047 - 0.1118) ÷ 0.8047 of the total current, or its resistance will have to be 0.1118 ÷ 0.6929 × R_{b1} = 0.162 R_b , where R_b is the normal resistance of circuit CB. The values of the shunts for different deflections are given in the table.

CALIBRATION OF SINGLE-PHASE METERS

To calibrate a single-phase power-factor meter using a condenser to advance the phase of the current through coil A, substitute a resistance for the condenser sufficient to give an indication of 1.00 on the scale (Fig. 5). The resistance R_{a2} will be found to be very high, as the condenser for which it is substituted has a large angle of advance for its current, and hence an apparently high resistance. With coil B alone connected the pointer may be deflected slightly on the lag side of 100 per cent power factor, whereas with coil A alone the pointer may show a large angle on the lead side of 100 per cent power factor. Call the first point zero and the second 90, thus forming a quadrant. The position of the pointer with both coils energized gives the true angular advance of the condenser in terms of 0 and 90 as found. For convenience in presenting the accompanying calculations this angle will be considered as one degree. The real resistance for circuit A will then equal $R_{a2} \times \cos 89 \text{ deg.} = R_{a1}$. The angle of 89 deg. advance for the condenser is used to simplify the explanation, but the real angle, found by testing, should be used.

Employing the resistance ratio method calibrating power-factor meters, only one man is required to mark the scale and no attention need be paid to variations in

Application of Motors to Steel-Mill Operations

Limitations to Speed of Mills—Power Requirements and Types of Motors Adapted Thereto—Control of Reversing Mills and Relative Economy of Steam and Electric Drive

BY C. E. CLEWELL

Assistant Professor of Electrical Engineering, University of Pennsylvania

Some important operations in steel mills to which motors have been applied are touched upon in this article. Notes on the arrangements of mill machinery, items which affect the power requirements of the motors, the principal types of motors used and features of the control apparatus are included. Economies which may be effected by the motor in comparison with steam-driven rolls are discussed, and reference is made to several interesting applications which are illustrated from practical cases.

A COMPLETE study of motor applications in steel-mill work would include the operation of such machinery as cranes, reversing and non-reversing stationary tables, manipulators, screw-downs, the operation of lift tables to include the lift motion as well as driving the rollers, and the field of general reversing and non-reversing applications. Obviously it would be impracticable, in a limited article of this kind, to attempt to treat completely each of these special applications. As a consequence the present discussion will be limited to one or two specific cases where the motor has resulted in a successful use of the principles on which the industrial applications of electric power have been based in recent years.

ARRANGEMENT AND DRIVE OF MILLS

Mills are arranged in various ways. Where small sections of metal are handled by a series of stands they may be arranged in one line and the power applied either at one end or at the center of the line. However, where roughing and finishing stands are included in one group, the roughing stands are usually operated at reduced speed, and the power is sometimes applied to wheels through rope drive, whereas the finishing stands may be directly connected to the motor for higher-speed operation. Such a scheme means, however, a fixed relation between the speed of the roughing rolls and that of the motor which is used also for the finishing rolls. With separate motors for each set of rolls the speeds of each may be adjusted independently to suit the best production conditions.

Various methods of mechanically connecting the motors to the rolls are employed, notably direct connection, gearing and rope drives. Where direct connection is considered it is necessary that the mill speed be adapted to the motor speed which is possible with the size of motor used. Sykes, in the "Standard Handbook for Electrical Engineers," gives the following speeds for 25-cycle motors as a minimum: 250 hp. to 500 hp., 125 r.p.m.; 500 hp. to 1000 hp., 100 r.p.m.; 1000 up to 2000 hp., 85 r.p.m.; 2000 hp. and upward, 70 r.p.m. These values indicate the necessity for certain limitations of the speeds of the mills if direct connection is to be employed.

To use motors with these minimum speeds implies a relative high first cost for the motor so that the geared connection is sometimes resorted to for the operation of small low-speed rolls by motors of higher

speed ratings than would be possible with direct connection.

The table, which indicates a number of typical motor applications to the main rolls of steel mills, shows the preponderance of alternating-current motors, this type being used in a majority of cases. However, alternating-current motors are not adapted to the reversing mills, and in this case the direct-current type must be used on account of its greater flexibility of control.

Modern mill motors are designed to withstand the high temperatures which often occur at the points where the motor must be installed. Improvements along this line have resulted in a motor for which the maintenance is greatly reduced over that which was experienced with earlier types.

CONTROL FOR THE REVERSING-MILL MOTOR

Some criticism has been made of the developments in the control of direct-current motors in recent years, due to the practice of inserting resistance in the arma-

FIG. 1—FLYWHEEL MOTOR-GENERATOR SET SUPPLYING POWER TO REVERSING MILL

ture circuit, which in itself represents very little or no advance over the methods of ten or twenty years ago. A notable example of a departure from this method, however, is in the control of the large direct-current motors used with reversing rolls. Here, a motor generator set (Fig. 1) is employed for the supply of each driving unit, the generator supplying adjustable voltage to the driving motor for the speed variation of the latter. Reversal of the driving motor is accomplished by a reversal of the supply voltage from the generator, which is brought about in turn by a reversal of the generator-field excitation.

With increased loads on the driving motor, the emf. of a second exciter termed the "series" exciter increases, since the driving-motor armature current passes through the field winding of this series exciter. This results in increased excitation for the driving motor, consequently reduced speed and less mechanical strain on the equipment, with some increase in driving torque.

With the master controller now thrown toward its

FIGS. 2, 3, 4 AND 5—MOTORS APPLIED TO SEVERAL DIFFERENT STEEL MILL MACHINES

off position, the excitation of the generator field is reduced and the driving motor returns electric power to the generator, thus operating the latter as a motor for the time. This results in an increase in speed for the motor-generator set with consequent storage of energy in the flywheel of the set (Fig. 1). In this way the speed of the driving motor is quickly reduced to zero and a large part of the energy required for acceleration is conserved by the flywheel and used in turn for the succeeding operation.

Among the items which determine the power requirements imposed on the driving motor of the motor-generator set, the flywheel will apparently have a considerable bearing, its tendency being to equalize the load on the main supply circuits. As for the loads throughout the duty cycle of the reversing driving motor, extreme variations follow as a consequence of the differences in the reductions of the material which is passed through the rolls and also because of the heavy requirements at the instant the material enters the rolls. The size of motor for driving must be such that it will supply these varying requirements without excessive heating, and the design must be such that the maximum torques and horsepower demands, which are very large at times, may be met successfully.

The practice has been to rate reversing mills on the maximum peaks of the operating load rather than on continuous capacity based on heating. The limitations

ECONOMIES IN THE USE OF THE MOTOR

A number of excellent papers have appeared recently which have dealt more or less fully with the advantages and economies of the motor-driven reversing mills in contrast with steam-engine power applications. As an example, an article in these columns² recently explained in considerable detail the comparative costs and performance of different types of drives, and for this reason it has been thought best to include at this point merely a brief statement of the factors involved in the way of a review or summary of the present attitude toward the electrically driven reversing mill, with an appended note on the more important papers, which may be consulted where greater detail is desired.

While the first cost of the reversing engine is set forth by the engine builders as only a small fraction of the total cost of the electric drive, carefully compiled figures on both kinds of equipment, when based on the total costs chargeable against the reversing-mill equipment, show that electric drive with purchased power has a lower first cost than, and the electric drive with power generated at the plant has a first cost comparable with, that of the steam drive. It is of course highly necessary in arriving at such a conclusion to include for the steam drive not only the reversing engine, but also the condenser equipment, foundations, boiler, piping and the like.

Messrs. Sykes and Hall³ give as the first cost

FIG. 6—BLOOMING MILL USING FOUR 100-HP. MOTORS FOR LIFTING TABLE, TWO 50-HP. MOTORS FOR FEED ROLLERS AND FOR 50-HP. MOTORS FOR THE ROLL TABLES

of this article prevent a detailed treatment of the design features which have been included in motors for this service, but in a supplementary note at the end of this article a number of references are given to comprehensive papers on various phases of the subject, to which the reader is referred for additional information.

¹A more complete discussion related to the use of flywheels for such purposes will be given in a subsequent article dealing with this specific subject.

equipment for driving a 40-in. (101.6-cm.) blooming mill with a capacity of 60,000 tons of steel per month for reducing from 24 in. by 24 in. (61 cm. by 61 cm.) to 8 in. by 8 in. (20.3 cm. by 20.3 cm.), the following figures: (a) Electric drive with purchased power,

³Paper on "Electric Drive for Reversing Rolling Mills," by V. Fred Sykes and David Hall, *Trans. A. I. E. E.*, Vol. XXXV, p. 5. References have been freely made to this excellent treatment of the reversing mill in the development of these economic relations.

95,000; (b) electric drive with power generated at the plant, \$325,000; (c) steam drive, \$300,000. The reader is referred to the paper of Sykes and Hall and to the ELECTRICAL WORLD article by Knight for further details on costs.

The argument that the reversing engine uses no more steam than the electric drive has been met³ on a basis of actual tests on a modern engine of this type and corresponding data on electrical equipment. Fig.

shows, for example, the horsepower hours per ton of steel rolled with electrically driven reversing mills⁴ and the pounds of steam required per ton rolled with steam apparatus. From the first curve and with known values of the pounds of steam required per horsepower-hour for large steam turbines the pounds of steam required by electrically driven mills per ton of steel rolled may be determined. Figures derived on this basis show that the steam consumption for the electric drive amounts only to about one-half of that required by the

reversing engine for the same material handled by the mill.

The conservation of all the energy required for acceleration in engine-driven equipments is given³ little or no weight, since such a claim is based largely on theoretical operating conditions of the engine-driven mill and, moreover, since the reduced energy consumption of the electric drive as outlined in item (2) is obviously the point to be considered in this general

FIG. 7—RELATION BETWEEN INPUT TO ELECTRIC AND STEAM-DRIVEN REVERSING MILLS AND ELONGATION OF THE STEEL ROLLED

connection. In other words, even if the engine drive does save more of the accelerating energy, its gross energy consumed per ton is so much greater than that of the electric drive that this feature is of little or no consequence.

As to reduced efficiency of the motor drive at partial loads, it is pointed out³ that while the electrically driven mill does suffer some reduction in economy with reduced loads on account of the continued windage and friction losses of the flywheel motor-generator equipment, the net power, without considering these more or less constant losses, per ton of material handled is essentially independent of the quantity which passes through the rolls, and, furthermore, that, owing to the constant losses in an engine equipment, the conditions surrounding its operation are somewhat like those of the motor drive at partial loads.

Concerning the time required for the operation of the two kinds of equipment, tests³ on each indicate that the electrically driven mill can be operated as rapidly or more so than with engine drive. Besides a number of secondary advantages, such as the ease of control and the like, materially favor the electric drive.

The foregoing discussion has reviewed briefly certain information which is available on steel-mill motive power. Owing to limitations imposed on the discussion by the space available, the reader is referred to the papers and articles mentioned in the bibliography printed below for further information on various phases of the subject.

Central-Station November Operations

Compilation of Returns Made to the "Electrical World" Covering November, 1917, Indicates Increase of 15.3 per Cent in Gross Revenue and 17 per Cent in Kilowatt-Hour Output

CENTRAL-STATION company returns compiled by the ELECTRICAL WORLD still apply to the period last year when industrial activity was at a high point. The reports of operations in November, 1917, show close to the same increased volume of output and gross earnings, as compared with the corresponding month of 1916, indicated in the preceding months.

The available statistics, covering nearly one-half of the industry, show gains of 15.3 per cent in gross revenue from energy sales and of 17 per cent in kilowatt-hour output, in November, 1917, as compared with November, 1916. Although output increased at a greater percentage rate than the gross revenue therefrom, the

difference between the two was much smaller than during most of the months in the year covered by the returns. This indicates that apparently the increase rates resulting from the higher cost of operation had a perceptible effect in making the percentage increase in gross revenue more nearly commensurate with the percentage increase in kilowatt-hour output.

Generally the statistics continue to reveal the large rate of growth which has been significant of electric

FIG. 1—CENTRAL-STATION INCOME AND OUTPUT GAIN BY MONTHS IN PER CENT FOR UNITED STATES

central-station operation for many months. As some time is required for the compilation of the statistics by individual companies and then for their collection and tabulation by the ELECTRICAL WORLD, they necessarily refer to a period which, though recent, does not reflect current conditions. Not for some time will the effect of the Garfield order be apparent in the returns. It should be kept in mind also that the returns for the months of 1918 will be compared with the very high figures of 1917 and may not present the same record of increase on top of increase which has characterized the reports for many months past. In any event, however, the totals of gross output are large.

Taking the actual returns as received and applying them to the estimates for the central-station industry

FIGS. 2 TO 5—CENTRAL-STATION INCOME AND OUTPUT GAIN BY MONTHS IN PER CENT SECTIONALLY

as a whole, the totals indicated for November, 1917, are: Gross revenue, \$42,900,000; output sold, 2,110,000,000 kw.-hr.

ELECTRIC FANS FOR FUEL CONSERVATION

By an Agitation of the Air, Which in a Still Room Is of Different "Temperature Strata," Less Heat Is Required

BY CHARLES CATLETT

The statement made above is not strictly true, any more than the statement that an electric fan "cools the air." If an electric fan were started in a closed room, the friction from the fan as well as some of the converted electricity would actually add some heat to the room. But in hot weather an electric fan does cool the body and does give a sensation of coolness by the more rapid evaporation of the visible and invisible moisture which is always forming on the surface of our bodies. In an analogous way the use of an electric fan in winter may, by making more available the heat in a room, make us warmer than we would otherwise be and reduce the total amount of heat which by the ordinary methods of heating must be added to a room.

A moderate-sized room, which at the time was overheated by a low-pressure radiator, was tested with an accurate chemical thermometer and the air was found to be in more or less distinct layers, with a very marked difference in temperature between floor and ceiling:

Distance Above Floor, In.	Temperature, Deg. Fahr.	Distance Above Floor, In.	Temperature, Deg. Fahr.
124.....	83	44.....	74
108.....	80	31.....	68
93.....	80	4.....	66
64.....	76	0.....	62

The total amount of heat in the room was sufficient to make the whole room approximately 74 deg., greatly

in excess of what is necessary or desirable. A person sitting down would occupy about 50 in. to 54 in. (about 1.3 m.) between his feet and his head inclusive. His feet would be about 4 in. (10 cm.) above the floor, and the center of his body about 26 in. (65 cm.). If he stood up, his head would be between 65 in. and 72 in. (about 2.2 m.). If a person were sitting down in this room, his feet would be at a temperature of about 64 deg., the center of his body about 67 deg. and his head about 75 deg. If he stood up, his head would be about 77 deg. Above his head would be a mass of highly heated air which would be performing no useful service.

It will be noticed that the difference between the temperature of the room at the center of the body and at 9 ft. above the floor was 13 deg. A great many tests showed that when a small 8 in. (20.1-cm.) electric fan was operated diagonally toward the ceiling the temperature near the ceiling was quickly reduced, and that at 26 in. (65 cm.) (the center of the body when sitting down) it was increased so that the difference was reduced to 7 deg. or less. The only way to realize how great is the difference commercially and from a heating standpoint is to remember that three or four degrees mark the difference between comfort and discomfort and between a healthful temperature and an unhealthy temperature.

These conditions are accentuated when a relatively small amount of highly heated air is expected to heat a large building. This heated air rushes to the ceiling. In a room 20 ft. (6 m.) high, for instance, the entire space occupied by a person sitting down would only be a little more than one-fifth of the total height, while the center of the body would only represent a little more than one-tenth. It is perfectly easy to understand that nine-tenths of such a building may be heated greatly above what would be comfortable or desirable, while the occupant of a choir or a pew may be cooler than is necessary for health and comfort.

There can be no question that if an electric fan or some other means were used to agitate and thoroughly mix the air previous to the occupation of the building a more uniform, economical and satisfactory heating would be secured. Anything that would cause a considerable movement or draft while the building was occupied would not be satisfactory, because the draft, by increasing the evaporation from the body, would feel cool. But probably in all large halls which do not have a positive fan system of heating and ventilating the use of an electric fan when heating a building for occupancy would be found a valuable assistance.

Furthermore, as pointed out in the above statement regarding different temperature levels of a still room a constant agitation of the air might easily produce a room temperature that would admit of a smaller heat supply and thereby conserve coal. At the present time, of course, more than the usual importance attaches to this phase of the matter.

STATION & OPERATING PRACTICE

A Department Devoted to Problems of Installation, Operation and Maintenance of Equipment for Economical Generation and Distribution of Electrical Energy

ECONOMY IN OILS AS PRACTICED IN GERMANY

Notices in Factories and Plants Tell Workmen How to Avoid Wastage in the Use of Lubricating Materials

Notices are now displayed in German workshops and power plants giving hints to the operatives on economy in the use of lubricants. These notices should be valuable in any country. Their provisions are as follows:

Use only closed oil cans, with spouts that will deliver drops, or at most only a thin stream.

Use all lubricating apparatus strictly according to the instructions and put the oil only where it will actually lubricate. If a machine has automatic droppers, shut off the supply while machine is standing.

Do not use cylinder oil on shafting or elsewhere when cheaper oil will answer.

Keep all rubbing surfaces in good condition. Rough surfaces and too-tight boxes consume more oil. Worn and leaky bearings waste oil.

Always use drip pans and arrange to filter and cleanse the oil so caught. It is as good as new.

Collect all greasy waste and wiping cloths, so that the oil may be recovered. Never burn them.

Be careful about using lubricating oil for cooling a bearing. Water will often do as well.

Be careful about using oil for cleaning and polishing. Never clean the hands with oil. A greasy cloth will do as well.

POINTS TO CONSIDER IN THE DESIGN OF TERMINALS

Weak Links That May Gain Inclusion in the Design of Terminal Points in Switching Apparatus Are Pointed Out

BY FERDINAND BECHOFF

The aim of this article is to try to point out some of the weak links to be found in electrical systems, especially in connection with electrical switching apparatus. Experience has shown that many breakdowns have occurred which were due not so much to faulty apparatus, such as oil circuit breakers, etc., as to neglected connecting links between the apparatus and the generator or buses. The fault in such cases is much more with the designer of the switching arrangement than with the manufacturer, because by proper selection of even existing devices the breakdown could have been avoided.

The heating up of terminal points is one of the most common reasons for breakdowns, and this danger becomes more and more pronounced with the installation of large power-plant units and the consequent use of larger oil circuit breakers and other switching devices. It seems that the selection of suitable terminals has not been emphasized enough to the electrical designer of switching apparatus, because so many cases of faulty terminals are still to be found in electrical layouts. While everything is being done to calculate the required amount of copper in regard to conductivity and contact

surfaces of the buses, only scant attention is paid to the terminals themselves. Investigation has shown that in most cases the contact surfaces are too small and the fastening bolts too large.

In designing switching arrangements a terminal with a bolt hole as in A should not be considered, as the

WEAK AND STRONG TYPES OF TERMINAL POINTS

contact surface and conductivity in this case have been reduced to a minimum. In B is shown the proper drilling for such a terminal. It is pointed out that care should be taken not to make the fastening bolts larger than $\frac{1}{2}$ -in. (1.37-cm.) diameter. The use of brass bolts and nuts is preferable, and all nuts should be locked by means of lock washers or similar means. If the width of the terminal end is 3 in. (7.6 cm.) or more, four bolts should be provided, in order to insure a good contact. The quantity of fastening bolts is one of the most neglected points in terminal design, although offering no difficulties. The general rule for determining the quantity of fastening bolts consists in treating the terminal end in a similar way as a copper bar to be fastened to a busbar, and the design laid down for the latter purpose should be the rule to be followed.

If the holes in the terminals are drilled, they should be slightly countersunk on both sides to remove the burr. Punched terminal holes require a grinding over of the contact surfaces. The design should furthermore avoid as far as possible the use of punched terminals bent at 90 deg., as shown in C. Care should be taken to bend the terminal end with a radius of at least $\frac{1}{2}$ in. (1.27 cm.) to avoid breaking at the bend.

Cast or forged terminals are sometimes preferred to punched terminals, especially in connection with laminated studs and with copper rods or tubes. A threaded

contact, as in E, is better than a soldered connection, and is made safer by the use of a lock nut or similar means. In order to avoid scrapping of cast copper terminals due to blow holes a core hole, as illustrated in D, is often helpful.

Oil and carbon circuit breakers, disconnecting and lever switches with ratings of 2000 amp. and above should be provided with laminated studs, in which case the use of laminated terminals is the most practicable. Even when such large capacity breakers or switches have round studs the laminated terminal can be used to great advantage, as shown in D and E. Copper bars connected in this way to the switch stud give better contact and are easier and cheaper to construct and assemble. Copper bars fastened to the round stud according to the method commonly used, as shown in F, form one of the weak links in electrical installations.

REBUILDING TOWER LINE DAMAGED IN SLEET STORM

Measures Taken to Prevent Recurrence of Failure of Transmission Line Operating Under Severe Climatic Conditions in Mountainous Country

Sixty-five towers in a two-circuit, three-phase, 60-cycle, 33,000-volt line were broken down not long ago by an extraordinarily heavy accumulation of sleet. The line in question traversed a mountainous territory so that it was necessary in making the repairs to carry channel iron into the mountains, rebuild and repair the

towers, and re-erect them on the site formerly occupied. The point at which the failure of the line started was a four-legged tower on the summit of one of the peaks over which the line stretched. This tower failed in compression, and this, of course, permitted all of the remaining towers to go down. The sketch shows how the line was rebuilt in order to guard against a recurrence of the disaster. A double set of four-legged towers was placed on the summit of the mountain, and each tower on the side of the mountain was guyed toward the summit. The cost of repairing this line with steel at 1914 prices was in excess of \$20,000.

DATA FOR ANALYZING

BOILER-FEED WATER

Necessary Information Required by the Chemist to Carry Out Properly an Analysis of Boiler-Feed Water

BY T. W. REYNOLDS

Instructions to be followed to insure that any sample of boiler-feed water received by the laboratory is a true specimen were presented on page 99 of the Jan. 12 issue of the ELECTRICAL WORLD. The following lists the information required by the chemist for analyzing the boiler-feed water:

1. Date sampled.
2. Source of sample, such as well, creek, lake, reservoir, etc. Give proper name or owner's name.
3. If a well, state kind, depth and diameter. If a well has been deepened by bore holes or otherwise, give dimensions of both parts.
4. Give suction head of pump. Give suction head when running at full speed.
5. State character of soil and water-bearing stratum.
6. Does sample present the usual appearance of water?
7. Does the water change in appearance at different seasons or after violent storms?
8. Are there any possible sources of pollution, such as coal mines, coal heaps, cinder heaps, factories, slaughter houses, stockyards, stables, sewers, cesspools, privies, foul pastures, refuse dumps, etc.? If there are any, describe fully on the back of the blank, giving distances, directions, relative elevations and character of pollution.
9. Has there been any considerable rain or melting of snow during the two weeks just previous to taking sample?
10. Is the water at present unusually high or low from any cause?
11. Is the quantity satisfactory at all seasons?
12. State distance of the supply from boiler. If a city, give the distance of nearest main from boiler.

CORRECTING POWER FACTOR IN DISTRIBUTION CIRCUIT

Static Condensers Are Used to Raise Power Factor from 60 per Cent to 90 per Cent on a Heavily Loaded Feeder

BY J. F. DUBOIS

Manager Electrical Department Lynn Gas & Electric Company, Lynn, Mass.

To take on an additional load of 160 hp. in a 550-volt secondary network system, where the primary feeder, switchboard panel and transformers were operating at over capacity, 570 kva., at a power factor averaging 60 per cent and at times running as low as 50 per cent, was the problem which confronted the engineers of this company about three years ago. The company was supplying energy to the neighborhood containing the factory by a 550-volt secondary network, shown herewith in single-line diagram, banks of transformers being connected in at various points.

Two courses appeared open—first, to improve the power factor of the operating circuit, and second, to install a new circuit with the necessary transformers, etc. The matter was discussed with engineers of the General Electric Company, who suggested that static condensers might be utilized, although no equipment of this kind for outdoor work had been developed at that time. It appeared that if the second plan of dividing the existing network and installing the necessary transformer and three-conductor cable from the station, to-

gether with switchboard panel and instruments, was followed, the operating conditions would not be improved, but that existing troubles would be increased. The generators would still be supplying the cables and transformers, with the transmission of a large wattless current. On the other hand, by the use of the static

LOCATION OF TRANSFORMER BANKS AND CONDENSERS

condenser the overload on the cables would be reduced. Generator and transformer capacity would be released for other service and the power factor would be improved along the whole system back to the generator. No excitation or operating labor would be required for this form of apparatus.

ARRANGEMENT OF STATIC CONDENSER EQUIPMENT STATIONS

Early in 1915 two static condensers rated at 100 kva. each were installed and connected to the secondary network. Space not being available at the factory first mentioned, one unit of 100 kva. was located in a machine shop across the street. At another point, between banks of transformers shown in circles in the illustration, a portable galvanized-iron building was erected to

house the other condenser. The company found itself able to take on this factory of 160 hp. in motors without the addition of a single transformer or the changing of the circuit in any way except in the installation of the condensers. The power factor of the circuit at the station was raised to about 78 per cent. The results were so satisfactory that in the present year another unit, of the subway type, was installed in an ordinary transformer manhole on Munroe Street, Lynn. In this case the cells are inclosed in two tanks, the accompanying reactance being inclosed in a smaller tank about the size of a 5-kva. transformer. An oil switch and contactor are inclosed in another tank, and an ammeter with transfer phase switch and push-button control are placed in a pedestal on the sidewalk. This equipment is working perfectly at present and in a recent test it raised the power factor of the circuit at the station from 60 per cent with the condensers all off to 90 per cent with all the units in, the present load being about 440 kva.

DEVICE FOR TESTING SERIES STREET-LIGHTING CIRCUITS

Homemade Motor-Driven Magneto Used for Testing Circuits—Method of Making Tests to Locate Faults

Many central stations have a rule requiring the testing of series street-lighting circuits during the daytime in order to permit trouble hunting during daylight hours should trouble develop. Often a series circuit will become open-circuited or grounded during the day because of an accident or the carelessness of a patrolman or repair crew, and if the circuit is not repeatedly tested the difficulty will not be discovered until it is time to turn on street lights, at which time the location of the trouble becomes more difficult and a lengthy outage results. It is good practice to test series circuits for open circuits, grounds and crosses at two-hour intervals during the day, particularly after noon.

A device which will be found very useful in the testing of series circuits is a motor-driven magneto. A home-made outfit can be readily rigged up with a telephone magneto and a fan or other small motor ordinarily available about a station. These are attached to a wooden base and mounted near the constant-current transformer panels. A coil spring between the motor and magneto makes a good flexible coupling. A snap switch completes the outfit.

A pair of plugs with insulated handles are attached to the magneto terminals. Then with the plug switches on the series circuits pulled to the outer position the operator may quickly test for open circuits by passing down the panels, touching each pair of plugs with the magneto terminals. In testing for grounds one magneto terminal is grounded and the other is touched to the circuit terminals in succession. The magneto is to be preferred to testing out with lamps, and the motor drive permits the testing to be conveniently done by one man. Crosses are tested for by grounding each circuit. As all secondaries in the system will ordinarily be grounded, a secondary cross will show up in this manner. A primary cross (the primaries being normally ungrounded) will cause a flow of current due to charging or leakage current.

CENTRAL STATION SERVICE

A Department Devoted to Commercial Policy and Management
Topics, Including Applications of Electric
Light, Power and Heat

PREPARE HONOR ROLL FOR UNINTERRUPTED SERVICE

Idea Stimulates Competition Between Various Properties of One Organization and Could Probably Be Applied to District Offices Also

An honor roll is being compiled for those Doherty properties which give uninterrupted service. The names on the list are obtained from the weekly reports of the various properties, in which they state the number of interruptions to service during the week just past. Seven companies are on the honor roll for giving perfect service for the two weeks ended Dec. 10. They are the Cumberland & Westernport (Md.) Electric Railway Company, the Durham (N. C.) Traction Company, the Hattiesburg (Miss.) Traction Company, the Lincoln (Ib.) Gas & Electric Light Company, the Lorain County (Ohio) Electric Company, the Massillon (Ohio) Electric & Gas Company, and the Montgomery (Ala.) Light & Railway Company.

This information is sent to all of the properties in the organization and helps to promote competition in the matter of service. The same idea could undoubtedly be applied still further in some degree to district offices of electric light and power properties.

WORK OF NEW-BUSINESS DEPARTMENT IN NEW YEAR

What Will Guide the Sales Activities of Central Stations Engaged in Merchandising Energy and Electrical Goods

In 1918 the central-station man who wants to spend a good deal of his company's money and charge it to capital account will have to show his superiors how that money will come back, not in three, four or five years, as in normal times, but in three, four or five months. That situation changes the aspect of new-business solicitation. In fact, it very nearly reverses what is considered normal procedure in that the salesman will need to become adept at dodging business, especially if it is a "peak," instead of being alert to secure new contracts.

But, despite this apparently dark outlook, most companies desire to hold their sales organizations together. What are these men going to do? That is the question executives have been asking themselves in the Middle Western States, and within the last few weeks the answer has begun to be apparent. It is, of course, desirable that these men shall apply themselves to some sort of sales work which will increase the company's revenue without increasing its investment. It is, therefore, desirable to increase the consumption of present customers. One way of increasing the business from existing customers is to make it increasingly convenient for them to use the installation they have. Hence

among residential customers campaigns will be started to sell "more sockets for more service." Baseboard and other appliance receptacles are the things that make for this increased convenience.

The demand for this sort of thing is already here, as is demonstrated by the following incident: The manager of an electric shop moved into a new apartment in which there was only one baseboard outlet, and that was in the living room. As a condition to signing the lease the landlord was induced to add five more outlets. The manager became acquainted with six other families in the building. When they called at his home and saw the extra outlets they wanted some for their apartments. The landlord, besieged with requests, refused to grant any, and then the tenants had the extra receptacles added at their own expense.

Another means of creating more revenue from existing installations is, of course, by selling more domestic appliances. There will probably be more than the usual number of flatiron campaigns. Other appliances, including ranges, will be pushed in some sections. It is probable that in the larger communities electric ranges will not be pushed so actively, because plant capacity must be conserved for the power business which must be taken on account of government work. All tendencies seem to indicate, however, that electric ranges will be sold in the smaller communities. In the cities the proved labor-saving appliances will probably enjoy ready sale on account of the increasing acuteness of the servant problem.

It seems, therefore, that in 1918 the commercial departments' activities will be centered on selling things which build revenue without increasing demand. Drives to get "more sockets for more service" and appliance campaigns will be the order of the day.

BILLING BY MACHINE

MAKES LARGE SAVING

One Lighting Company Found a Saving of 20 per Cent in Billing Expense, Besides a Considerable Shortening of Time

About one year ago the Commonwealth Edison Company of Chicago made a trial installation of twelve Elliott Fisher adding typewriters. With these machines the company handled 20 per cent of its accounts. In using these machines the operator, working directly from the meter-reading book, makes out the bill, posts the ledger, and makes a recapitulation sheet, all at one operation, the entry in the ledger and on the recapitulation sheet being a carbon copy of the bill. On each machine there is a totalizer, or adding machine, on each column. For instance, there is one on both the present and previous wattmeter reading; there is one on the kilowatt-hours used, on the gross bill, discount, net bill, etc., and in addition there is a cross-footing mechanism and total-

TECHNICAL THEORY & PRACTICE

Including a Digest of Important Articles Appearing in
the Scientific and Engineering Press
of the World

Generators, Motors and Transformers

Extinguishing Fires in Large Totally Inclosed Generators and Motors.—M. A. SAVAGE.—This article recommends the use of steam for extinguishing fires in windings of large motors and generators where the construction permits of its application. The results of tests show that steam is quite as effective as other substances, such as carbon tetrachloride and carbon dioxide, and is free from their objectionable features.—*General Electric Review*, January, 1918.

Electrical Laboratory Apparatus for Educational Institutions.—J. J. LAMBERTY.—For the instruction of engineering students college laboratories should be equipped with practically all types of electrical apparatus, but the cost of separate units of each type is prohibitive for most institutions. This difficulty has been largely overcome by the apparatus described in this article, which incorporates in one design, by substitution in some cases of interchangeable rotors, a great variety of machines. For instance, the alternating-current generator may be operated as a synchronous motor, a squirrel-cage induction motor, a phase-wound induction motor or a frequency changer by using the proper one of three rotors. Similarly the synchronous converter may be used as a direct-current generator, an alternating-current generator, a direct-current motor, a synchronous motor or an inverted converter.—*General Electric Review*, January, 1918.

Lamps and Lighting

An Oxygen-Filled Tungsten Lamp.—According to a recent German patent, beneficial results follow the burning of a tungsten filament in an atmosphere of oxygen at low pressure. This, it is claimed, prevents discharges through chlorine vapors evolved from anti-blackening materials introduced into the bulb. The oxygen at low pressure does not appreciably attack the incandescent tungsten filament, but in the colder regions of the lamp vaporized tungsten is oxidized to tungsten trioxide. The pressure of the oxygen present is, however, extremely low, being less than 0.005 mm. of mercury. The small amount of oxygen initially introduced into the lamp would be quickly used up, and the author therefore proposes to include within the bulb certain oxygen-yielding substances, such as the oxides, nitrates, chlorates, etc., of suitable metals. Manganese oxide in small quantities is found very beneficial.—*London Illuminating Engineer*, November, 1917.

Transformation of Tungsten Crystals Into Filaments for Incandescent Lamps.—By a new method tungsten filaments, to which a small quantity of oxide of thorium is applied, can now be made without drawing, laminating or hammering. The article gives a brief description of how they are fabricated from crystals—a method subject to many German patents.—*Revue Générale de l'Electricité*, Dec. 22, 1917 (abstracted from *Elektrotechnische Zeitschrift*, April 26, 1917.)

Testing Arc Lights Under Pressure.—Wilhelm M. thiesen, a German electrical engineer, recently conducted a series of tests with arc lights under different pressures of the two gases composing the atmosphere (oxygen and nitrogen). The first tests showed that the brilliancy of the light increases with increased pressure, while the specific consumption decreases, although the total amount of energy used is greater. The brilliancy itself, as well as the rate of increase, depends also upon the kind of salts mixed with the carbons. The second series of tests showed that the brilliancy of the arc can be increased by simply increasing the pressure of the gas, without increasing the consumption of energy. The rate of increase depends upon the gas used (air, oxygen or nitrogen). If calcium fluoride is mixed with the carbons and the resulting gases are permitted to accumulate, the brilliancy of the arc diminishes rapidly.—*Schweizerische Bauzeitung*, Dec. 1917 (abstracted from *Elektrotechnische Zeitschrift*).

Generation, Transmission and Distribution

Report of the Advisory Committee on Brown Coal (State of Victoria), September, 1917.—Among the conclusions reached by the committee as the result of investigations are the following: With present prices the brown-coal fields offer a supply of much more economical fuel than black coal for the production of electrical energy. The demand for electrical energy in Melbourne is sufficient to form the nucleus for an industrial electrical supply system. For a demand of 50,000 kw. delivered at Melbourne at 20,000 volts the total cost per unit supplied from power houses situated respectively at Melbourne, burning black or brown coal, and at Morwell, burning brown coal, are as follows:

	Total Costs per Unit at a Load Factor of 43.2 per Cent, Pence	
Power house in Melbourne using—		
Newcastle coal	0.353	100
Wonthaggi coal	0.348	(84)
Brown coal (Altona)	0.328	(28)
Power house at Wonthaggi using black coal....	0.350	(91)
Power house at Morwell using brown coal:.....	0.267	(54)

Electricity Supply Restrictions in Germany.—It is reported from Berlin that the Imperial Coal Commissioner issued an order on Nov. 2, 1917, placing an immediate restriction on the electrical consumption of both customers of electric supply undertakings and persons or organizations who possess their own generating plants. The consumption is limited to 80 per cent of that which prevailed in the corresponding month of 1916, although the commissioner reserves the right of curtailing the consumption by more than 20 per cent in particular cases. The restriction also applies to establishments engaged on war work, although preferential treatment can be meted out in exceptional cases. Consumers on a small scale are exempt from the restrictions, provided that their individual use does not exceed

250 kw.-hr. per annum, but the communal authorities are permitted to fix a lower limit. New connections and extensions of existing connections can only be made on obtaining special consent. It is stipulated that consumers who receive a supply from a public utility must pay an increase of 12 cents for every kilowatt-hour used in excess of the fixed limit. If, despite special warning, consumers do not restrict their consumption in the prescribed manner, they will be liable to imprisonment for a period up to one year, or a fine of up to \$2,500. Sixty truckloads of coal a day will shortly be saved in connection with the electric lighting of Berlin by erecting an overhead high-pressure transmission line between Wittenberg and Berlin, which will now be fed by the Zschornowitz-Piesteritz line, supplied from the Zschornowitz (lignite) power station, the generating station for works for the fixation of nitrogen. The overhead line will be made of aluminum-covered iron, and the work is being carried out by the A. E. G.—*London Electrical Review*, Nov. 22, 1917.

The Swiss Law Concerning the Utilization of Hydraulic Power.—G. TOCHON.—An examination by a French lawyer into the law concerning water power that became effective in Switzerland Jan. 1. Like the new Italian law, it tends to centralize all public utilities occupying water sites and to bring under public control the reserve energy contained in rivers and falls. The predominance of the general interest over private interests is insisted on. Each canton has, however, the right to dispose of its own water powers, subject to the broad policy prescribed by the confederation. Only in two cantons have private rights been predominant in the past. It would perhaps be exaggerated, the author says, to speak of the state as having seized the sources of hydraulic power; it is rather a matter of stricter control within just limits which are such as not to prevent development.—*Revue Générale de l'Électricité*, Nov. 24, 1917.

Traction

Railroad Electrification.—A. BARBAGELATA.—The writer holds: (1) That at present it is absolutely necessary for Italy to push railroad electrification in every manner; (2) that electric traction may be economically extended even to secondary lines, if they are treated like suburban lines, with light and frequent trains; (3) that the three-phase, 16-cycle system adopted in Italy, which has given excellent results on the Giovi lines, is no longer the best, and that direct current at high tension should be substituted.—*L'Elettrotecnica*, Dec. 25, 1917.

Installations, Systems and Appliances

Relay Protective Devices.—C. J. MONK.—This paper describes the various types of relays used on the Rand Mine & Power Supply Company and the Victoria Falls Power Company systems, with details of their operating characteristics and results achieved with these automatic devices. There are something like 400 relays in operation on the systems.—*Transactions of the South African Institute of Electrical Engineers*.

Ironclad Switchboard.—Description of high-tension ironclad distribution boards and truck-type cellular switchboards equipped with oil switches, etc.—*London Electrical Times*, Dec. 27, 1917.

Examples of Electrically Driven Cranes.—H. H.

BROUGHTON.—The author points out in this article the great importance of using machinery in place of unskilled labor. Examples are given of special plants for handling materials, such plants including shipyard cranes, steel works cranes and bridge tramway plants.—*London Electrician*, Dec. 14, 1917.

Belt Shipping Plants.—F. G. MITCHELL.—Attention is drawn to the great advantages of the belt conveyor for conveying coal and ore in bulk. A detailed account is given of an interesting plant at Durban. This plant is not limited by mechanical difficulties, and any disadvantages do not increase, but rather the reverse, as the output is increased.—*London Electrician*, Dec. 14, 1917.

Wires, Wiring and Conduits

Transposition Joint for Split-Conductor Cables.—Description of a method for providing transposition joints in three-core split-conductor cables to balance the impedances of the inner and outer conductors. It involves the use of a hard-wood separator for each conductor. After stepping back the lead and insulation in the usual way, two short lengths of braided copper of a total section equal to one of the conductors are bound and sweated to each inner conductor; the two pieces of copper braid are then threaded through apertures provided in the hard-wood separators, the ends of the inner conductors being separated from one another by a dia-

JOINT FOR THREE-CORE SPLIT-CONDUCTOR CABLE

phragm left solid in the center of the wood block, and are bound and sweated to the outer conductor of the adjacent length. The braid lies loosely along shallow grooves on the outside of the separators, expansion and contraction of the conductors thus being also provided for. The joint on each phase is then surrounded by a paper tube, the three tubes of the completed joint being bound together, centralized by means of spreaders, and the whole inclosed in a lead sleeve and filled up solid with insulating compound in the usual manner. Joints made in this manner by jointers having no special knowledge of the requirements of split-conductor joints have withstood 15,000 volts between split conductors for five minutes and 100,000 volts between phases and between phases and earth for fifteen minutes, at a temperature of 176 deg. Fahr.—*London Electrical Review*, Jan. 4, 1918.

Electrophysics and Magnetism

New Radiator Type of Hot-Cathode Roentgen-Ray Tube.—W. D. COOLIDGE.—The article is descriptive of the new radiator type of hot-cathode Roentgen-ray tube developed for military use. The essential feature of this tube is the target of large heat capacity (provided

with an external radiator) of such composition that the focal spot will not at any temperature emit electrons. The tube therefore is self-rectifying, which makes it feasible to operate the tube directly from the terminals of a high-tension transformer. A description of a simple and effective lead-glass protective shield is included.—*General Electric Review*, January, 1918.

Electric Conductivity of Mica.—EDOUARD BRANLY.—Abstract of a paper read before the French Academy of Sciences embodying the results of experiments on mica with particular reference to its use as an insulating material in wireless telegraphy. A leaf of mica about 0.003 mm. thick was placed between two metallic disks. In a very short time its electric resistance to a continuous current became of negligible value when the applied emf. was less than 0.004 volt and the mechanical pressure was not more than 1 cm. of mercury. A descriptive summary of the apparatus employed is given, together with data on the variations of conductivity in mica as apparently influenced by the diameter of the minute holes discoverable by means of polarized light.—*Revue Générale de l'Electricité*, Nov. 24, 1917.

United States Magnetic Tables and Magnetic Charts for 1915.—D. L. HAZARD.—As its name implies, this report gives terrestrial magnetic data obtained by the United States Coast and Geodetic Survey for 1915.—*Department of Commerce Special Publication No. 44*.

Chromium Steel for Magnets.—Owing to the commandeering of tungsten for military purposes, German electricians found themselves without tungsten for their magnet steels early in the war, and experiments on the use of chromium in the place of tungsten, which had already been projected before the war, were accelerated. From investigations conducted by the Reichsanstalt chromium steels which have undergone suitable heat treatment do not rank below tungsten steels on an average. The very best magnetic chromium steels, however, are not equal to tungsten steels. Technically, chromium steels would thus appear to be quite satisfactory, while for special researches their further improvement is desirable.—*London Engineering*, Jan. 4, 1918.

Miscellaneous

Utilization of Pulverized Coal.—HENRY G. BARNHURST.—After calling attention to the fact that the use of pulverized coal for heating purposes is not new, 30,000,000 tons to 50,000,000 tons having been used to date in cement mills alone, the author mentions some of the characteristics that are desirable in coal in order that it may be burned satisfactorily in this form. Large deposits of lignite, quantities of coke breeze and millions of tons of silt or waste coal are available for burning in the pulverized forms. The author then goes on to explain the degree of fineness to which coal should be crushed before drying, the best methods of drying, extracting pieces of iron, the care which should be exercised in pulverizing and storing the fuel and how it may be conveyed to the place of usage. The power required in a first-class pulverized-coal plant per net ton of coal handled is in the neighborhood of 17 hp.-hr. per ton produced. Generally speaking, the repair expenses run 5 cents to 7 cents per net ton handled. With coal carrying 5 to 10 per cent moisture about 25 lb. to 35 lb. (11.3 kg. to 15.9 kg.) of coal has to be burned to dry a ton.

When handled in large quantities 50 tons to 100 tons and upward can be pulverized and delivered to the furnaces at a cost of 20 cents to 50 cents a ton. Generally speaking, an ideal plant with a capacity of 100 tons of pulverized coal daily will cost, with the present prevailing high prices, in the neighborhood of \$300 to \$400 per ton of coal pulverized. The cost of a plant for 250 tons daily capacity of pulverized coal will be from \$250 to \$300 per ton.—*Journal of Cleveland Engineering Society*, November, 1917.

Report of British Coal Conservation Committee.—The sub-committee of the reconstruction committee in Great Britain recommends that the present inefficient electric service system in that country be superseded by a comprehensive system divided into about sixteen districts, in each of which there shall be one authority dealing with all generation and main distribution. Sites suitable for electric generating purposes should be chosen on important waterways and preferably outside, not inside, towns. Plans should be prepared for the construction immediately after the war on these sites of large super-power plants capable, first, of supplying energy to a comprehensive electric power distribution system and, secondly, of supplying electrical energy at lowest possible price for all processes and manufactures. Such plants should be designed so that, as methods are perfected for extracting by-products from fuel before using it for the purpose of production of electrical energy, the by-product plant can be combined with the power plant. Power available from surplus gas or waste heat should be turned into electrical energy in local plants, which should feed into the main distribution system. Coal which does not warrant transportation away from the mine should be used at the spot for power generation. With a view to carrying out this policy, a board of electricity commissioners should be appointed with the following powers: (a) To stop the extension or multiplication of uneconomical stations for public supply; (b) to arrange for the handing over on equitable terms of the generation, transmission and main distribution systems in each of the areas into which the country is to be divided; (c) to standardize for each area the frequency and voltage of the main transmission and distribution systems; (d) to select for each area authorities to work under adequate control as regards limitation of dividends, etc. Alternative types of electric service organizations are described in an appendix. In reference to these alternative types the sub-committee emphasizes the need of initiative and resource in the management of electric service organizations and the freedom of range and keenness which are distinctive of private enterprises, as such things are highly conducive to the best success.—*London Electrician*, Dec. 28, 1917.

Hardening of Aluminum Bronze.—According to advice from Europe, copper-aluminum alloys, combined with small quantities of iron, silica, etc., can be made to equal in hardness Bessemer steel with 0.35 per cent carbon. In order to obtain these degrees of hardness, temperatures of 800 deg. C. are required, whereby 100 deg. to 260 deg. (Brinell test) is reached. Bearings made of such aluminum bronze have proved satisfactory with shafts turning at 20,000 r.p.m.—*Schweizerische Bauzeitung*, Dec. 22, 1917 (abstracted from *Z. d. V. D. I.*).

NEWS OF THE INDUSTRY

Chronicle of Important Events and General Activities
in the Technical, Commercial and
Manufacturing Fields

STUDY OF THE TARIFF BY ASSOCIATED MANUFACTURERS

General Committee Is Co-operating with Section
Committees—Separate Treatment of Electrical
Apparatus and Supplies Desired

Steady progress is being made by the tariff committee of the Associated Manufacturers of Electrical Supplies in its work of studying tariff conditions affecting the electrical manufacturing industry.

At a recent meeting of the committee there were also present a number of members of section sub-committees on tariff.

The chairman, John J. Gibson, Westinghouse Electric & Manufacturing Company, stated that in each section committees were preparing to act along the general lines proposed.

B. E. Salisbury, Pass & Seymour, Inc., felt that one point to be considered was administrative features of the tariff law. Mr. Salisbury stated that so far as he knew the tariff schedules on electrical devices were very incomplete and that it would be necessary to outline some plan especially applicable to the wants of the electrical industry. He also felt that the duties now assessed on an ad valorem basis should be based on the market price. After extended discussion the following resolution, which was presented by Mr. Salisbury, was passed:

Resolved, That it be the sense of this meeting that the value of all electrical commodities now assessed on an ad valorem basis should be determined by the market price of those commodities in this country rather than the market price in the country of origin."

One member brought up the desirability of some tariff legislation to overcome the condition that foreign makers had copied the design of many devices of electrical supplies, which they were bringing into some sections of this country and selling in direct competition with the home markets, although these various devices had not yet been approved by the Underwriters' Laboratories.

F. S. Sells, Diehl Manufacturing Company, emphasized his opinion that at this time it would be impracticable to develop figures representing the amount of tariff protection needed on any particular lines, and his opinion was concurred in by all present. It was thought necessary for the section tariff committee to make the study which had been requested and complete so that the committee could have it approved by the various sections.

In the meantime the general committee should take steps to get into touch with the United States Tariff Commission, with the purpose of recommending the following results:

First—That the electrical industry be recognized so that, if thought advisable, it would secure separate treatment of its apparatus and material instead of

having them mixed in with the apparatus and material of other industries.

Second—In order that the electrical industry might have a voice at the present time in the matter of the revision of the administrative sections of the tariff law.

It was the sense of the meeting that the general tariff committee should secure from the board of governors authority to employ a tariff expert.

Chairman Gibson called attention to the resolution passed by the board of governors broadening the duties of the general tariff committee so that they would include questions in regard to export as well as import. Authority has been given by the governors to change the name from the tariff committee to "international trade committee" if this would be desirable.

I. E. S. TO DISCUSS THE CURTAILMENT OF LIGHTING

Preston S. Millar to Present Paper at Special Meeting
in New York on Feb. 14—General
Discussion Planned

A special meeting of the Illuminating Engineering Society will be held at 8.15 on Thursday evening, Feb. 14, in the Engineering Societies Building auditorium, New York, to discuss lighting curtailment.

A paper will be presented by Preston S. Millar, general manager Electrical Testing Laboratories and chairman of the committee on war service of the Illuminating Engineering Society. The author will present figures dealing with coal consumption, including the coal employed for lighting throughout the country and the amount which may be saved, methods of accomplishing the results expected through the curtailment of lighting, present status of artificial lighting used for various purposes and other pertinent facts.

The following is a list of those who have been invited to speak personally or send a representative to discuss this question: Albert H. Wiggin, Federal Fuel Administrator for New York; Harry T. Peters, member of the conservation and advisory committee of the New York State Fuel Administration; John W. Lieb, chairman National Committee on Gas and Electric Service; R. E. Enright, Commissioner of Police; Nicholas J. Hayes, commissioner of Water Supply, Gas and Electricity, New York; Dr. Colman W. Cutler, chairman illumination committee, National Committee for the Prevention of Blindness; Ernest T. Trigg, chairman committee on coal conservation, United States Chamber of Commerce; Dr. Edward B. Rosa, acting director National Bureau of Standards; L. B. Marks, chairman national lighting committee, United States Committee of Labor; Frank W. Smith, chairman lamp committee, National Electric Light Association. Representatives of the American Institute of Electrical Engineers and American Gas Institute are also expected to participate.

Effect of Garfield Fuel-Saving Order

Statements to the "Electrical World" Supplementing Those Published Last Week

BUFFALO GENERAL ELECTRIC COMPANY

OUR load has been reduced 30 per cent. Total kilowatt-hour output per day has been reduced 17½ per cent; 60 per cent of our output is steam-generated and the balance, 40 per cent, hydro power. Our coal saving amounts to about 225 tons each twenty-four hours.

NEW YORK EDISON COMPANY AND UNITED ELECTRIC LIGHT & POWER COMPANY, NEW YORK

The reduction in output of the two companies together for the five days of the Garfield order—Jan. 18 to 22, inclusive—represented an average of 21¼ per cent. The estimated saving in coal for the full period is approximately 3000 tons.

PUBLIC SERVICE ELECTRIC CO., NEWARK, N. J.

During the five days of the so-called Garfield order the output was curtailed very materially. Our normal load is approximately 125,000 kw., and on the first day of the order this was reduced to about 40,000 kw., which load was somewhat increased later on owing to exemptions granted in specific cases. Roughly speaking, it might be said we were operating on a less than 50 per cent basis during the five days the order was in force.

INDIANAPOLIS LIGHT & HEAT COMPANY

Our peak load prior to the Garfield order ran about 17,000 kw., with 230,000 kw.-hr. output for the day and a consumption of 1,050,000 lb. of coal. The effect of the Fuel Administration order was to reduce the peak to 9129 kw., with a total output of 113,000 kw.-hr. and a consumption of 696,000 lb. of coal.

MERCHANTS' HEAT & LIGHT COMPANY, INDIANAPOLIS

We inclose typical load curves which show the comparative effects for three days: Wednesday, Jan. 16, 1918, load curve representing normal condition of operation before any orders were issued by the Fuel Administrator; Thursday, Jan. 17, load curve showing the effect of the local order closing stores at 4.30 p. m. as issued by Dr. Jameson, Marion County Fuel Administrator; and Friday, Jan. 18, load curve showing the effect of order shutting down all of the manufacturing industries as issued by Dr. Garfield.

These curves show graphically the conditions to be expected on our system as a result of the Fuel Administra-

tor's order, and it is evident that it will mean a considerable reduction in our gross receipts due to the decreased electrical output in kilowatt hours. At this time we are not prepared to give definite estimates of the actual saving of fuel that may result. The radical change in the character of our load makes it hard to figure the saving accurately.

COLUMBUS RAILWAY, POWER & LIGHT COMPANY

As compared with the corresponding days of the preceding week our output was reduced as follows: During the five days of reduced operation covered by the Garfield order: Friday, 29.6 per cent; Saturday, 23.9 per cent; Sunday, 18.0 per cent; Monday, 31.3 per cent; Tuesday, 18.0 per cent.

Taking the five-day period as a whole, the decrease in output as compared with the five corresponding days of the

To the Citizens of Columbus:

THIS COMPANY is today in a more critical situation as regards fuel supply than ever before, having in fact only enough coal on hand to produce its normal output for a period of two days.

The large savings in fuel, resulting from the five-day suspension order of the Fuel Administration, have been more than offset by the failure of the railroads during the severe weather to deliver coal to meet even the reduced demands.

A suspension of electric service is probable if not inevitable. You can postpone that suspension by using less current.

The Columbus Railway Power & Light Company

preceding week was 24.6 per cent or 430,000 kw.-hr. During this period our peak hour was decreased as follows on various days: Friday, 8300 kw.; Saturday, 4500 kw.; Sunday, 3100 kw.; Monday, 6700 kw.; Tuesday, 3250 kw.

During the period covered by the Garfield order railway service was reduced considerably and extreme efforts were made to induce the users of electrical energy to close or reduce their requirements to a minimum. All of our lines, however, were energized as usual, we taking the position of the responsibility for obeying the order rested with the consumer and not with us except in cases where we might receive specific instructions to shut power off from specified consumers. Compliance was so general that we received no such orders.

The effect upon our revenue was substantially in proportion to the reduced output. The amount of fuel saved was also approximately in proportion to the decrease in output. At the beginning of the five-day period we had on hand 2800 tons of coal and at its close we had on hand 1600 tons. At the beginning of the five-day period there were in transit on the steam roads, consigned to us, ninety carloads of coal. At the close of the period there were in transit on the steam roads, consigned to us, eighty carloads of coal. From these figures it is apparent that although we consumed very much less fuel the railroads and mines were unable to keep up with our requirements.

READING (PA.) TRANSIT & LIGHT COMPANY

Our 480 industries closed down on midnight of Jan. 22 to resume operation on Jan. 23, with the exception of power plants which were on the exempt list on account of working on strictly governmental work. Our newspapers and

manufacturers have shown the most enthusiastic and patriotic spirit in conforming with this plan.

MASSILLON (OHIO) ELECTRIC & GAS COMPANY

The effect has been to cut our load approximately 75 per cent and necessarily has cut our revenue by a greater percentage, but has affected our operating expenses only a very little.

CHARLESTON (S. C.) CONSOLIDATED RAILWAY & LIGHTING COMPANY

Day load reduced about one-third.

CENTRAL POWER COMPANY, NEWARK, OHIO

Our output is reduced approximately 25 per cent. Practically all of our industrial power consumers have obeyed the order to close, and we expect a reduction of 50 per cent. However, we have large power consumers in the mining districts who of course are making use of power. We anticipate a further reduction on Jan. 19 and 21, and in all probability our output will be reduced 50 per cent on account of the order. The saving is approximately 75 tons of coal per day.

MISSISSIPPI RIVER POWER COMPANY

As would be natural, the increased fuel prices during the last six months, as compared with pre-war conditions, have caused our customers to use as much of our power as they could.

The normal water power available with our present installation at this point is approximately 650,000,000 kw.-hr. per annum. Taking 5 lb. of coal per kilowatt-hour as the average consumption with the Illinois coal available in this section, we figure that this 650,000,000 kw.-hr. represents an annual fuel saving of about 1,625,000 tons of coal.

During the calendar year 1917 we manufactured 481,505,050 kw.-hr., which on the same basis of figuring as I stated above would represent a saving in coal during 1917 of about 1,200,000 tons.

ALABAMA POWER COMPANY

At present no steam energy is being supplied the hydro system of the Alabama Power Company and therefore, so far as the energy served customers by this system is concerned, they have not been affected. It possibly, however, has affected some customers who use fuel for heating or other purposes. The customers who are served by energy made by steam at points not connected with the hydro system, however, are affected by the regulation issued by the Fuel Administration governing coal consumption.

URGE FUEL ECONOMY BY SHUTTING PRIVATE PLANTS

Indiana Public Utility Men Ask Fuel Administration to Consider Cessation of Operation of Inefficient Power Stations

C. N. Wilcoxon, F. J. Haas, S. W. Greenland, Robert Todd and Charles L. Henry, a committee of Indiana public utility operators, have made four recommendations to Evans Woollen, Fuel Administrator, Indianapolis. The first three have to do with heating, lighting and operation of street cars. The fourth is:

One other thing we would suggest that it would be advisable to inquire into, and that is whether in many instances small power plants, which are always operated uneconomically and at a heavy expense, might be discontinued and the necessary energy now produced by them be supplied from larger and more economically operated stations. This, we consider, is a field from which much might be secured in the way of fuel economy, and it would incidentally be a benefit to the consumer of energy, because he can usually purchase energy from a larger plant at a less price than he can produce it himself at the smaller plant.

The recommendation has not yet been acted upon.

WHITE CEDAR ASSOCIATION URGES ACTION ON WAR BOARD

Problems of the Pole Industry Arising Out of the War Are Discussed at the Twenty-second Annual Meeting—J. E. Gerich Elected President

The labor situation, priority regulations, income tax laws and conditions of supply and demand in the pole market were the main topics discussed at the twenty-second annual meeting of the Northern White Cedar Association at the Hotel Radisson, Minneapolis, on Jan. 22.

The labor situation in the camps was described as one of great unrest. This condition was ascribed to the war. The belief was expressed that labor should be conscripted in order to assure a successful and vigorous prosecution of the war. The application of the income tax to individuals and to business firms was explained by several speakers. For the more vigorous prosecution of the war the following resolution was adopted:

It is hereby resolved that it is the unanimous opinion of this convention that for the best interests of the country, and to expedite the prosecution of the war to a successful conclusion at the earliest possible time, a war board should be established at once, composed of a small group of men selected from the best possible talent to be obtained in the United States, with full power to act under the direction of the President for a speedy prosecution of the war with every resource we can command.

A. T. Naugle of Chicago, speaking for the pole committee, commented upon the surprising amount of poles on hand. He ascribed this condition to some extent to the lack of transportation facilities. He stated further that the purchasing power of operating utility companies was restricted by inability to secure funds for improvements. It was the consensus of opinion that sales for the coming year would not exceed 50 per cent of those for 1917.

The report of the secretary, N. E. Boucher, stated that in 1917 traffic in cedar products had reached an extraordinary volume.

The election resulted: J. E. Gerich, MacGillis & Gibbs Company, Milwaukee, president; L. L. Hill, Page & Hill Company, Minneapolis, vice-president; W. B. Thomas, White Marble Lime Company, Manistique, Mich., treasurer; N. E. Boucher, secretary; W. L. Lafean, Nagle Pole & Tie Company, Chicago, and J. C. Kirkpatrick, National Pole Company, Escanaba, Mich., retiring president, were elected directors.

"EDISON PIONEERS"

FORM ORGANIZATION

Early Associates Organize a New Society to Include Those Who Were with the Inventor Up to 1885

Early associates of Thomas A. Edison in laboratory work and his various enterprises met on the evening of Jan. 24 in the council room of the American Institute of Electrical Engineers and organized a new society to be known as the "Edison Pioneers." The following organization was effected: President, Francis R. Upton; vice-presidents, S. Z. Mitchell and T. C. Martin; secretary, R. T. Lozier; treasurer, Fred Scheffler; historian, W. H. Meadowcroft. The membership is limited to those who were with Mr. Edison up to 1885.

COAL OUTLOOK ACUTE IN THE MIDDLE WEST

Curtailment of Electric Service to Non-Essential Industries and in Some Places to Domestic Consumers Seems Inevitable

The coal situation is so serious in Illinois, Iowa, Michigan and Wisconsin that curtailment of electric service to non-essential industries, and in some places of service to domestic consumers, between 9 a. m. and 5 p. m. seems inevitable. This is the opinion of the Illinois Fuel Administration.

Speaking to a representative of the ELECTRICAL WORLD, Deputy Administrator Allen said that at present there is absolutely no reserve supply of coal.

The realization of these conditions and the desire to meet the difficulties have caused the Illinois Fuel Administrator to issue a broad order which will cover the curtailment of public utility service. This was issued purely as a coal-saving measure that is deemed necessary. The Fuel Administrator has expressed a desire to keep every public utility operating.

In some cases, among which are those of the Galesburg Railway & Light Company and the Aurora, Elgin & Chicago Railroad, coal has been confiscated to keep plants in operation.

In commenting upon this situation the Fuel Administration paid high compliments to the Insull group of public utilities. The companies had laid in large quantities of coal. When the shortage came they very liberally gave up their surplus to other public utilities and to various other concerns so that even now their own supply is short.

WAR SERVICE WORK OF THE UTILITIES COMMITTEE

National Committee on Gas and Electric Service Is Active in Many Directions Bearing on Government War Needs

A partial report of recent activities of the National Committee on Gas and Electric Service was published in the last issue of the ELECTRICAL WORLD, page 216. Other recent activities of the committee, of which J. W. Lieb is chairman, are shown in the following extracts from the report. They indicate tendencies in the affairs of the utilities and the trend of problems affecting their service in the war:

The War Department in increasing the facilities for the production of important war material is constructing and considering the construction of many new plants which will require either the installation of a complete new power plant or additions to present existing steam plants. This has brought about the necessity of repositioning large electrical apparatus, including steam turbines, which at present are under order by the various public utilities with electrical manufacturers. In order to disturb central-station conditions as little as possible, this committee has been asked to co-operate with the War Department, and on receiving the requests of that department as to size and type of machinery required, the committee takes up with the various central stations having orders placed for delivery at about the dates these machines are required by the government. Selections are made that will disturb central-station conditions as little as possible.

Some disturbance has been caused recently to electric light and power plants when manufacturers who are being served go ahead with additional construction work and ex-

tensions to their plants without first conferring with the central-station officials as to whether the power which they apparently depended upon getting for their extensions would be available. This has happened in a number of cases, and through no fault of the public utilities they have suddenly been called upon for a supply of electrical energy which their generating capacity is unable to meet. The situation thus becomes complicated when it becomes necessary for certain industries which have enjoyed uninterrupted service to have their service curtailed or even discontinued in order to take care of the additional demands made by the enterprise of greater importance which has made the more recent demands for service.

Several delegations of steel manufacturers and others making necessary war material have visited this committee with requests that we use our influence and assistance to render possible the extensions to certain central stations upon which they expect in the near future to make heavy demands for service. This is a much better method of approach than by going ahead with their own extensions without first finding out whether power is available.

This committee is still endeavoring to obtain all the information possible regarding any excess supply of hydro-electric energy that may be available, which information is very much sought for by the government with a view to establishing munition plants and other plants to manufacture war material in the vicinity where such power would be available.

At the meeting of the war service executive committee of the United States Chamber of Commerce on Jan. 16 the National Committee on Gas and Electric Service was recognized as having been formed in accordance with the resolutions adopted at the conference of war service committee chairmen on Dec. 12 to represent the gas and electric light and power industry.

WAR SERVICE WORK OF WASHING-MACHINE MAKERS

Labor-Saving Character of Product Set Forth by the Industry, Which Is Standardizing to Effect Economies

Through its war service committee the American Washing Machine Manufacturers' Association has presented facts concerning its industry to the War Industries Board.

Every member of the association and a number of other manufacturers have agreed to eliminate 171 styles and models which might be considered as less essential as soon as present stock of material for these styles and models is consumed. They have also agreed to eliminate sixty-three parts on styles and models which they hope to be permitted to continue to manufacture, this elimination to be accomplished by standardization, use of duplicate parts now used and by elimination of parts not essential to successful marketing of the machine. They have also agreed not to purchase any more of the materials claimed as eliminated except what is absolutely necessary to balance up material now in stock.

Fuel used in the industry in 1917 included 19,641 tons of coal and 2,369,418 kw.-hr. of electrical energy. Total capital employed in the industry was \$9,650,000, and the value of the product (factory) in 1917 was \$10,000,000. Employees were 5000. Plants manufacturing washing machines for household use total 106.

The War Service Committee, which emphasizes the labor-saving character of the product, is composed of L. E. Dietz, H. W. Eden, J. D. A. Johnson, W. L. Rodgers and Sam T. White, chairman, and Raymond Marsh, secretary.

DISCUSSION ON WAR EFFECT AT CHICAGO SECTION, A. I. E. E.

Changing Viewpoint on Extensions for Customers
Brought Out at the Western Gathering—Conservation by Commercial Departments

[This account of the discussion at the Chicago Section on the paper by Lynn S. Goodman and William B. Jackson on "Effects of War Conditions on Cost and Quality of Electric Service" follows the report of the discussion at the meetings of the New York and Boston Sections, published in the ELECTRICAL WORLD of Jan. 19, 1918, page 165.]

On account of the severe weather the attendance was small at the meeting of the Chicago Section of the American Institute of Electrical Engineers on Jan. 14. About seventy-five were present.

After Mr. Jackson had presented the paper R. F. Schuchardt, chairman of the meeting, opened the discussion. He characterized the paper as one of importance to engineers and financiers. While recognizing the pessimistic side of the paper, he spoke strongly of its brighter aspects, one of the most important of which is the widespread recognition of the real value of this economic industrial development and of the benefit from centralization which must react to the industry. He closed with an appeal to engineers to be resourceful and to create precedents rather than to follow old lines of thought.

F. A. Coffin, Milwaukee, reviewing the situation from the central-station sales department's angle, pointed out ways in which commercial engineers can effectively aid in conservation movements.

C. W. Pendell also discussed the paper from the commercial viewpoint, emphasizing the necessity that customers shall finance extensions.

D. W. Roper stated that the former value he had placed on service interruptions, nearly twenty times the loss of the revenue to the company, had undergone recently a marked revision downward on account of the changing times. He also pointed out that while formerly a customer would be taken on if his revenue would pay the cost of extensions in two years, it was now thought to be advisable to consider such customers only if the revenues would pay for the extension in two months. After outlining some curtailments of gratuitous service that had been or might be made, he emphasized the importance to central-station companies of urging a movement to diversify the hours of industrial and office employees for going to and returning from work. This would, of course, reduce the peaks of both labor and power requirements. To emphasize the importance of this Mr. Roper stated that one-third of the investment of the Commonwealth Edison Company produces only one-half of 1 per cent of the company's total output during the year.

C. A. Keller, who had made recently a study of increased values of generating stations and substations on account of present high prices, presented a table showing the percentage of increase in value to-day as compared with normal previous times. The pre-war figures were based on varying market prices over a period of ten to fifteen years before the war. The table showed that generating stations, including buildings, boiler equipment, turbines and auxiliaries and electrical equipment, have increased 45 per cent; substations, including buildings, electrical equipment and

storage batteries, 30 per cent; line extensions, including conduits and tunnels, poles, cross-arms and pins, transmission lines, overhead lines, underground lines and services, 50 per cent, and transformers 30 per cent. The weighted average per cent increase over the whole list was 43 per cent.

A. Honegger, in a discussion of the difficulties of getting capital, pointed out that utility securities were being sold to farmers in some Western States.

CLEVELAND HEARING ON OHIO INDUSTRIAL LIGHTING CODE

Unusual Interest by the Manufacturers in Proper
Lighting for Their Establishments Is Shown
at Initial Public Hearing

Unusual interest among manufacturers in the proper lighting of their establishments was shown at the first public hearing on the proposed code of lighting for factories, mills and other workplaces for Ohio. More than 300 representatives of industrial plants and factory inspectors were on hand when the hearing opened at the Hollenden Hotel, Cleveland, on Jan. 16, under the direction of Victor T. Noonan, director of safety, Ohio Industrial Commission.

The proposed rules are based largely upon the code prepared by the Illuminating Engineering Society, but the supplementary matter differs greatly in treatment from that issued by the society. A novel feature of the Ohio code is the classification of industrial operations under the several grades of intensity required in the rules. This is the first attempt made in any state to give such definiteness to the regulations, making it possible for plant managements to know just what standards factory inspectors will require them to maintain.

It is worthy of note that no objection was voiced to the minimum values of intensity required for the several industries and operations; several plant engineers pointed out that their practice was well above these values and in some cases even above the upper values of the suggested range for good practice. Discussion of the code related largely to its construction from the legal standpoint and questions of liability under special conditions.

Educational features were combined with the hearing. The principal factors in lighting—intensity, direction, diffusion, glare, etc.—were shown by simple exhibits. There were motion pictures of industrial hazards, including insufficient and faulty illumination. Great interest was shown by those present in the new foot-candle meter.

The proposed code was prepared by a special committee of the Industrial Commission, consisting of Prof. F. C. Caldwell, Ohio State University, chairman; J. Q. Adams, architect, Industrial Commission; H. H. Craiglow, operating engineer Buckeye Steel Castings Company; S. E. Doane, chief engineer National Lamp Works; Thomas J. Donnelly, secretary Ohio Federation of Labor; John J. Graney, Federation of Labor, Youngstown; H. L. Jenkins, works manager, Holophane Glass Company, and George W. Walker, Cooper-Hewitt Electric Company, secretary.

Further public hearings are planned for Cincinnati and Columbus during February.

—From the Atlanta Constitution.

GENERAL INCREASE OF RATES MADE AT PROVIDENCE, R. I.

Features of the New Schedule Are the Coal Clause
for Lighting Service and the Service Charge—
No More Free Lamps

With approval of the Rhode Island Public Utilities Commission a general increase in rates by the Narragansett Electric Lighting Company, Providence, has been established, effective on all electricity billed on and after Jan. 1, 1918.

This is the first rate increase in the history of the company, covering about thirty years, although many decreases have been made. The war has brought about unforeseen and abnormal conditions, the company pointed out to the commission, resulting in changes in prices for labor and materials, especially coal, which have increased so materially the cost of producing and supplying electricity as to necessitate rate revision. The company has realized for many months that it would be necessary to change rates if public obligations are to be met and standards of service maintained, but it has deferred action as long as it reasonably could. Every effort has been made to economize, and much has been accomplished and will be continued under the new schedule, with the hope of greater savings in the future.

The chief factor in increased cost of production is coal. From Jan. 1 to Oct. 31, 1917, the company burned 75,995 tons of coal at a cost of \$641,944, an average of \$8.44 per ton. During the corresponding period in 1916, 49,178 tons were burned at a cost of \$187,631, an average of \$3.81. Making proper allowance for the increased production of electricity in 1917, the company estimates that cost of coal increased \$227,000 for the ten months. This will be increased somewhat for the year.

To provide for uncertain and fluctuating coal prices,

the rate schedule now adopted is based on a price of \$8 per ton and is governed by a coal clause. Rates will be increased or decreased automatically according to the average price of coal at stated intervals. In this adjustment the company has endeavored to make rates equitable to all classes. In pursuance of this a service charge has been provided in connection with retail lighting. This will insure a fair return from a large number of customers whose payments under the former schedule have been insufficient to cover even the cost of installing and maintaining meter and service.

The company has also discontinued the practice of furnishing a multiplicity of meters to certain classes and the free supply of carbon lamps.

Based on 1917 sales, the new schedule would have increased the gross revenue approximately \$211,000. The new schedule was submitted to representatives of Providence and to R. B. Brunet, city public service engineer, before presentation to the Public Utilities Commission. It received the approval of all these authorities.

Probably the most important revision is the introduction of a service charge of \$6 per year into lighting rate "A," under which electricity is sold to residence customers and other small users. The rate was formerly 9 cents per kilowatt-hour, with no service or minimum charge. Because of this rate the company has accumulated a large number of customers using little or no electricity. In 1916 and 1917 the number of customers paying less than 50 cents per month varied from approximately 1500 to nearly 8000. This large number of unprofitable customers shifted the burden which they should have borne to those who used more electricity.

The company feels that the service charge principle is preferable to the minimum charge, as the customer who uses more electricity under a service charge gets a more favorable price. The new rate consists of a service charge of \$6 per year billed at 50 cents per month and an energy charge of 7.5 cents per kilowatt-hour for all electricity used. It is provided that no electricity shall be billed at less than 9 cents net per kilowatt-hour, including both service and energy charge. Summer customers, or those requiring installation for a few months in the summer season at a location not their permanent residence, are required to pay a minimum of \$10 for the season or any part. Summer customers whose residence is outside the Providence city limits are required to deposit \$10 to guarantee payment.

The furnishing of lamps for first installation and renewals has been discontinued under all rates. The company has also discontinued the practice of furnishing a multiplicity of meters to customers operating office and factory buildings. The former policy was to install a lighting and power meter for each tenant in such buildings and bill the electricity to the owner or landlord. The new practice calls for the installation of one meter for each rate under which the customer purchases electricity. All other meters are furnished at a rental of 50 cents per month per meter.

The former "B" rate (for lighting customers, domestic heating appliances and motors of 1 hp. or under) has been increased $\frac{1}{2}$ cent per kilowatt-hour on every step except the first, which remains at 10 cents per kilowatt-hour from 1 kw.-hr. to 499 kw.-hr. per month. The minimum rate on this schedule is $4\frac{1}{2}$ cents for

100 kw.-hr. and over, and there is a minimum charge of \$2.50 per month on this rate. Time switches are rented at 50 cents per month per switch on both "A" and "B" rates. Formerly there was no minimum charge per month on the "B" rate.

The power rate "D" has also been increased $\frac{1}{2}$ cent per kilowatt-hour. This is now $6\frac{1}{2}$ cents net, and former minimum charges obtain of \$1 per month under 1 hp., 50 cents per horsepower per month from 2 hp. to 10 hp., and \$5 per month for installations exceeding 10 hp.

Power rates "F" and "G" have also been increased both service and energy charge. The range in the "F" rate (for customers signing an annual contract with a demand of 5 hp. or more) is: 5 hp. to 10 hp. demand, monthly service charge, \$1.75 per horsepower; energy charge per kilowatt-hour, 1.6 cents; for 200-hp. to 300-hp. demand, \$1.25 monthly service charge per horsepower and an energy charge of 0.95 cent per kilowatt-hour. On the "G" rate (for customers signing contracts for a demand of 225 kw. or more), the range is as follows: One-year contract: 225 kw. to 300 kw., \$1.54 monthly service charge per kilowatt of demand and an energy charge of 0.95 cent per kilowatt-hour; on 375 kw.-hr. and more the energy charge is 0.85 cent. On a contract for five years or more the monthly service charge for 500 kw. to 750 kw. demand is \$1.44 per kilowatt of demand, and for 1500 kw. demand and more it is \$1.20 per kilowatt of demand. In all cases, including these limits in demand, the energy charge is 0.85 cent per kilowatt-hour. Under the "G" rate, should the net price of energy for any month under five-year contract rates, including demand and energy charge, be lower than 1 cent per kilowatt-hour, the bill for that month is rendered either at the flat rate of 1 cent per kilowatt-hour, including demand and energy charge, or at the one-year contract rate, whichever is lower.

FINANCING SERVICE EXTENSIONS

In consideration of the fact that the expense for lines and equipment necessary to supply customers is considerably in excess of normal cost and in further consideration of the difficulty of financing extensions, when the customer agrees to pay to the company a sum equal to the full cost of necessary lines and equipment. Such portion as shall represent the excess cost over and above normal costs as of July 1, 1914, shall be retained by the company. The balance, "normal cost," is to be refunded to the customer annually at the rate of \$20 for every \$100 paid to the company for electricity used by the customer at this location. The company agrees to pay 6 per cent interest on any unrefunded balance of normal cost. After five years from the beginning of the unrefunded balance of normal cost becomes the property of the company. The company reserves the right to refund at any time all or any part of the unrefunded portion of normal cost.

The coal clause applicable to power rates and to the lighting rate for demands over 5 kw. is based upon a cost of \$8 per long ton of coal of 14,500 B.t.u. in the bunkers of the Narragansett company station. The cost of coal in the bunkers for any month is determined for such month by obtaining the true average cost of all coal in storage on the first day of such month and all coal received during such month, and after making any

necessary adjustments for heating values or handling, storage and carrying charges for each month. Coal cost for any longer period is taken as the true average of monthly costs during such period. For every 10-cent decrease or increase in cost as determined below or above \$8 per long ton there is a decrease or increase of 0.1 mill per kilowatt-hour under this contract. Such decrease or increase is made by periods of three months each, and the cost to be used in determining such decrease or increase for this period is that determined as above for the three months' period next preceding.

In connection with lighting rates "A" and "B," for every decrease or increase of \$5 or fraction greater than one-half in the cost of coal as above determined below or above \$8 per long ton there is a decrease or increase of 5 mills per kilowatt-hour sold. Any decrease or increase is made for periods of six months each, and the cost to be used in determining such change for the period is that determined as above for the six months' period next preceding.

The service charge or minimum charge under all rates other than those requiring a contract for one year or longer ceases upon discontinuance of service, but should the service be replaced within one year for the same customer \$1 is charged. The customer's application forms a part of the schedule, as printed for distribution, as in the practice of the Philadelphia Electric Company.

CIVILIAN INSPECTORS ARE NEEDED FOR SIGNAL CORPS

Men of Mature Years and Judgment with Specialized Training Can Devote Services to Government in Helping Speed Production

The personnel division, inspection and training for the War Department inspection section, equipment division of the Signal Corps, in the Chicago district needs a few men of mature years and judgment to undertake work of inspection of materials, parts, sub-assembly and final assembly. Men preferably under forty years of age and over draft age are in demand.

The work is divided into five departments: Motors, instruments, fabrics, electrical work, lumber and lumber treatment. Men who have training in any of these lines and feel that they have enough education to adapt the knowledge of their profession to the government's needs by means of a short training course for inspectors in Signal Corps work may present applications.

Fred R. Jenkins, formerly manager of the Chicago Central Station Institute, is devoting a large part of his time to selection and training of men for this work. He has been appointed general supervisor of the personnel division named above, with headquarters in the Consumers' Building, Chicago. With few exceptions the Chicago district embraces all of the territory west of Pittsburgh to the Rocky Mountains and from Canada to the Gulf.

The inspectors selected must fulfill a dual function. In addition to conducting inspection work they will be expected to accelerate quantity production. The latter duty is considered of great importance. The men who are appointed as inspectors will retain their civilian status, but will be sworn employees of the government. Senior inspectors are paid not to exceed \$150 per month and junior inspectors not to exceed \$125 per month.

INSISTENT DEMANDS FOR MORE POWER FROM NIAGARA

Needs of War Industries and Curtailment of Supply
to "Non-Essential" Industries in Buffalo District
Stir Consumers to Urge Action

Aroused by the insistent demands of munition and other war industries along the American Niagara frontier for additional electric power, the government is now beginning to realize the urgent necessity of utilizing to the fullest extent the natural resources of Niagara Falls.

Unable to meet the demands for additional power, the government has been forced to requisition all of the energy produced, imported and distributed by the Niagara Falls Power Company, the Hydraulic Power Company and the Cliff Electrical Distributing Company, of Niagara Falls, and plans are now being made by the War Department for a complete redistribution. More than five score factories and mills will be cut off.

Some of these so-called non-essential industries will be supplied with limited amounts of power during off-load hours, and many will be forced to work only at night, but some have given up all hope of operation during the war.

Although the redistribution has relieved the situation considerably, the government is still unable to meet demands of war industries, and efforts will be made at this session of Congress to secure a new international treaty between the United States and Canada.

The present treaty allows diversion on the American side of 20,000 cu. ft. (560 cu. m.), and Canadian power companies have the right to divert 36,000 cu. ft. (1008 cu. m.). American power companies are not diverting all of the water allowed under the treaty because of lack of equipment. Before the war the power companies were diverting 15,600 cu. ft. (436.8 cu. m.), the maximum allowed by Congress, but until next June they have the right to divert the full 20,000 cu. ft. Instead of developing the additional 4400 cu. ft. (157 cu. m.) allowed by Congress as a temporary measure, the two American power companies are diverting only about 3000 cu. ft. (84 cu. m.) of the additional amount.

The additional diversion amounts to only 80,000 hp., which is far from sufficient for the increased demands of industries. Electrical engineers who made a recent survey on the American side say that diversion of 40,000 cu. ft. (1120 cu. m.) per second would not impair the scenic beauty of the cataract.

The Buffalo Chamber of Commerce urges the full diversion of 100,000 cu. ft. (2800 cu. m.).

Under the partial redistribution of power by the Niagara Falls Power Company and the Hydraulic Power Company two large paper mills in Niagara Falls using 5500 hp. were forced into idleness when their power supply was cut off. Plans are being made for releasing for war industries almost 7000 hp. now supplied to the Aluminum Company of America by the Hydraulic Power Company.

Phillip P. Barton, general manager Niagara Falls Power Company, says that 4000 hp. used by non-essential industries has been cut off and all other factories served by his company using 200 hp. will be cut to 100 hp. The International Railway Company will lose about 14,000 hp. now received from Niagara Falls. The International Company will be forced to rely almost

exclusively upon its steam station, and the government has ordered that it pool its interests with the Buffalo General Electric Company and release 5000 hp. from its 50,000-hp. steam capacity for other industries served by the Buffalo General Electric Company. The cost of generating by coal at the International Railway steam plant is almost \$40 per horsepower, and the company has been paying between \$20 and \$25 for Niagara Falls power.

All non-essential industries using electric power will not be allowed to operate between 8 and 10 o'clock in the morning or between 2 and 6 o'clock in the afternoon. By operating non-essential industries wholly at night there will be a saving of approximately 18,000 hp. of the Buffalo General Electric Company.

The addition to the Buffalo General Electric Company steam plant will be ready for operation early in the spring. This will mean an additional 50,000 hp. The government has negotiated with the company for an additional 50,000-hp. installation, to cost approximately \$5,000,000. With the government behind the project the work can probably be completed within one year.

HEARINGS ON THE WATER-POWER BILLS

Although They Will Be Held at an Early Date, They
Will Be Short, as the Country Is Well
Informed on the Subject

Hearings on present water-power bills, it is expected, will take place in one or two weeks, or just as soon as the emergency war measures have been acted on by the House of Representatives.

Thus far the only measure before the committee is the Shields bill, passed by the Senate. The so-called administration measure has not yet come up for action.

It is recognized very generally that water-power legislation is needed and it will be enacted, but not a war measure. Congressman Sims, chairman of the House committee having water-power legislation in charge, has intimated that the hearings on the measure will be short and formal, since the general subject has been pretty well thrashed out in Congress and the country is well informed.

GIFFORD PINCHOT APPROVES ADMINISTRATION BILL

In a letter issued on Nov. 16, 1917, Gifford Pinchot urged support of seven definite principles in water-power legislation. Mr. Pinchot states in a letter to the ELECTRICAL WORLD that every one of these principles is fully safeguarded in the administration's water-power bill. He adds:

What remains, therefore, is for Congress to put the measure through without delay. The administration water-power bill will first come before the House of Representatives, where an effort will certainly be made to amend it in the interest of the power interests. If that fails, the water-power lobbyists will endeavor to have the indefensible provisions of the Shields bill substituted in the Senate or the administration bill. Beaten in that, they will fall back upon the formula of obstruction and delay they have used successfully for the last ten years.

This measure is practical, fair and wise. The friends of conservation should insist that their friends in Congress shall give their prompt and full support to the administration water-power bill, and shall see to it that it is passed without emasculation, substitution or postponement.

Associations and Societies

The Directory of Electrical Associations, which is regularly printed in the first issue of each month, appears on page 287 of this number.

Maryland Division of the N. E. C. A.—At a recent meeting, attended by about 180 representatives of Baltimore's electrical business, the nucleus of a Maryland division of the National Electrical Contractors and Dealers' Association was organized. The principal speaker was William L. Goodwin.

Urbana (Ill.) Section, A. I. E. E.—At a joint meeting of the American Institute of Electrical Engineers, Urbana section, and the Electrical Engineering Society, held at the University of Illinois on Jan. 18, J. L. Stair, chief engineer of the National X-Ray Reflector Company, Chicago, delivered a lecture "Some Principles of Illumination and Their Application."

Further Development of Water Power.—In an address before the Columbus (Ohio) Rotary Club on Jan. 15, C. A. Under, president of the Niagara Falls Power Company, advocated the further development of the nation's water power. "The war program cannot wait," he said, "action must be prompt. The 3,000,000 or more horsepower available at Niagara Falls, said the speaker, if developed, would save for posterity about 100,000,000 tons of coal per year, or 100 horsepower per minute—a carload every thirty seconds."

Delegate Guests at St. Louis Jovian Luncheon.—Delegates to the first meeting of the year of the executive committee of the National Electrical Contractors and Dealers' Association, which convened in St. Louis Jan. 22 and were guests at the Jovian luncheon at the American Annex Hotel in that city Jan. 22. Col. Robley S. Stearnes, chairman of the organization, was the principal speaker of the occasion. Addresses were also made by James R. Long, E. L. McCreary and Harry C. Brown, secretary of the organization. J. B. Adam of the Frank Adam Electric Company officiated as chairman of the meeting.

Jovian Electric League, Los Angeles.—At the luncheon of the Jovian Electric League held Jan. 9 William F. Rice spoke on "South America." At the meeting held on Jan. 16 George A. Brown of the Bion J. Arnold Company, Chicago, and formerly dean of the Cooper College of Technology, Pasadena, addressed the league on "Making Democracy Worth While." Harry W. Brown of the Commercial Electric League acted as chairman of the day. At the regular Wednesday luncheon of the league on Jan. 23 Jay W. Stevenson, manager of the Fire Prevention Bureau of the Pacific, gave an illustrated address on "Reducing Fire Losses." A. Vedder was chairman of the day.

Los Angeles Section, A. I. E. E.—H. C. Gardett, assistant engineer Los Angeles Bureau of Power and Light, gave an illustrated address at the Jan. 15 meeting of the Los Angeles Section on features of the hydroelectric development of the city of Los Angeles. A round-table talk followed on the Los Angeles aqueduct and its significance to the city in time of drought, and praise was given to the men who made its construction possible. At the February meeting J. F. Wilson, University of Southern California, will speak on "Tendencies in Design of Generators."

"Balancing the Light Beam."—Under the foregoing title, W. A. Durgin lectured before the Chicago Section of the Illuminating Engineering Society on Jan. 17. As the lecturer explained, the title was a bit of popular camouflage covering the old subject of photometry. He explained the similarity between candlepower, illumination and brightness. Some of the fundamental principles of brightness and light flux were illustrated by means of ingenious apparatus. One interesting feature was a guessing contest by the audience on equality of brightness and on the relative brightness values of several surfaces presented. This demonstrated that the eye is a very poor judge of relative brightness values except where these values are nearly equal. Even then the presence of a color difference distorted the judgment. The three most commonly used types of portable photometers were explained, the speaker going in detail into their relative good and weak points. He also made a public exhibition for the first time of a new "brightness comparator" of his design, which is intended to measure the relative brightness of two adjacent surfaces within the field of vision, with a view to determining the contrast glare.

Central Station Versus Isolated Plant Discussed at Providence.—F. B. Kenney, Blackstone Valley Gas & Electric Company, Pawtucket, R. I., presented a paper on "The Central Station Versus the Isolated Plant" before the Providence Engineering Society Jan. 9, which was followed by a general discussion of the subject by the consulting and mill engineers present. In the discussion C. H. Bromley of *Power*, New York, said that most isolated plants fail through mismanagement, the indifference of many operating engineers to economic conditions being amazing. W. B. Lewis outlined the savings from scientific management in the plant of the Crown Hotel, Providence. The lack of interest shown by the manufacturer in his power plant was emphasized by Mr. Kenney. K. A. Skinner, Narragansett Electric Lighting Company, Providence, cited an isolated plant which ran non-condensing for about twenty-five years, changed over to condensing service, and because of some temporary noise in the piping went back to the old method. In closing, Mr. Kenney stated that the average manufacturer prefers to spend money for a tangible substance like coal rather than for an invisible service like that of the central station.

Current News and Notes

Timely items on electrical happenings throughout the world, together with brief notes of general interest.

Deposits for Gas and Electric Service.—The California Railroad Commission has authorized the Santa Barbara Gas & Electric Company to modify rules as to deposits for gas or electric service in residences so as to require a rate of \$2 for temporary occupancy and \$1.50 for permanent occupancy for four-room flats or dwellings, \$2.50 for between four and eight rooms, and \$5 for eight or more rooms.

Snow in River Blocks Power House.—One of the common methods of disposing of heavy snowfalls in Chicago is to haul the snow to the river and dump it in. Following this method of procedure after the recent heavy snowfall resulted in crippling the water-power plant of the Sanitary District at Lockport. So much snow was dumped into the river that it hindered the flow and resulted in a greatly reduced output at the plant.

Drive to "Recruit" 250,000 Men for Shipbuilding.—With the aid of the Council of National Defense, the Shipping Board, governors of states, organized labor and business, the Department of Labor began on Jan. 27 the "recruiting" of an army of 250,000 men to fill all present and future needs of the shipbuilding yards of the United States. Every man in the country with some skill in a mechanical trade used in shipbuilding and willing to accept employment in this branch of war industry will be enrolled and registered in the United States Public Service Reserve, a division of the United States Employment Service and the war labor "reservoir" which the Labor Department is creating to meet the coming needs of every war industry.

Booster Station in Plant of Power Customer.—The Illinois-Pacific Glass Company, San Francisco, made application recently to the Great Western Power Company for direct-current industrial load amounting to nearly 500 kw. An examination of the direct-current distributing system developed the fact that, with copper at 40 cents per pound, it would be preferable to install an alternating-current-direct-current machine at the plant rather than to extend the service leads of the direct-current system to accommodate a load of this size at the consumer's location. The power company had on hand a direct-current motor slightly larger than the capacity required, and this machine was installed and tied in with the direct-current system serving the territory in the vicinity of the glass works. With this arrangement the machine becomes a booster of considerable value in maintaining service in that part of the town.

C. E. Fabrney, manager of the Ottumwa Railway & Light Company, Ottumwa, Iowa, was elected director of the Ottumwa Savings Bank at its recent annual meeting.

W. E. Richards, electrical engineer of the Toledo Railways & Light Company, has been appointed a member of the electrical safety committee of the Industrial Commission of Ohio.

Harlow Moore has resigned from the position of district manager for the Pacific Power & Light Company at Seaside, Ore., to become connected with the Board of Fire Underwriters in Portland.

E. Dean Tanzer, assistant professor of electrical engineering, Lafayette College, has been appointed to the position of assistant professor of electrical engineering at the Georgia School of Technology and will assume his new duties on Feb. 1.

W. R. Davis, chief engineer of station A of the Springfield (Ill.) Gas & Electric Company, has had a grant of absence from the company while acting as chief instructor of the Naval Radio Service Training School at Dunwoody Institute, Minneapolis, Minn.

John H. Roemer, of the firm of Cummins, Roemer, Flynn, Milkewitch & McKenna, counsel to H. M. Byllesby & Company, and former chairman of the Wisconsin Railroad Commission, has been appointed one of a board of five appraisers to fix the value of the Bush Terminal properties in Brooklyn which have been taken over by the government for the period of the war. The valuation determined will be used as the basis for establishing the rental to be paid by the government.

Clayton W. Pike, consulting engineer of the Utilities Bureau, Philadelphia, has been commissioned a major in the Ordnance Department of the army. Major Pike was born in 1866 and was graduated from the Massachusetts Institute of Technology in electrical engineering in 1889. The following year he was electrical engineer for the Merrimac Manufacturing Company in charge of electric lighting, power and signals. During 1891 and 1892 he was instructor in electrical engineering in the University of Pennsylvania and during the two following years was electrical engineer for Queen & Company, manufacturers of scientific and electrical instruments. From 1895 to 1900 he was electrical engineer for the Falkenau Engineering Company, engineers and contractors, and from then till 1910 was vice-president and general manager of the Keller-Pike Company, electrical engineers and contractors. In 1912 he became chief of the Electrical Bureau of Philadelphia, resigning in 1916 to become engineer of the Utilities Bureau, which position he now holds. Mr. Pike has had a wide connection with engineering and technical societies and was president of the Electrical Section of Franklin Institute in 1896 and 1897, vice-president of the Society of Municipal Engineers in 1914 and 1915, and president of the Philadelphia Section of the A. I. E. E. in 1895.

Men of the Industry

Changes in Personnel
and Position—
Biographical Notes

Howard Pett, manager of the Albion plant of the Consumers' Power Company, has been appointed superintendent of power distribution of the company to succeed H. W. Courville.

S. R. Inch, operating manager of the Utah Power & Light Company, has been elected vice-president and general manager of this company, succeeding C. R. Groesbeck, who has become connected with the Electric Bond & Share Company. Mr. Inch first became connected with the Salt Lake City property Jan. 1, 1913, having previously been for seven years manager of electric light and street railway properties at Missoula, Mont.

Gerard Swope, vice-president and general sales manager of the Western Electric Company, has been decorated by the Emperor of Japan with the Or-

GERARD SWOPE

der of the Rising Sun. Mr. Swope has but recently returned home after spending seven months in the Far East. Since his graduation from the Massachusetts Institute of Technology in 1895 he has been constantly in the employ of the Western Electric Company and has been general sales manager since 1908.

Edward J. Neary, electrical engineer with the Public Service Commission for the First District of New York, engaged on rate and capitalization cases, has been granted a leave of absence to accept an appointment as an electrical officer on board the U. S. S. Utah with a commission as lieutenant. Mr. Neary was graduated from Pennsylvania State College and has been in the electrical field for the last ten years. Since he was graduated he has been with the American Gas & Electric Company, the University of Pennsylvania, H. L. Doherty & Company and the commission.

Lester S. Ready has been made electrical engineer of the Railroad Commission of California, in charge of the gas and electric department. Mr. Ready who has for several years been assistant engineer in this department, succeeds F. Emerson Hoar, who is now in government service.

Obituary

F. A. Driver, for many years a director of the Driver-Harris Company and identified with the company since its inception, died on Jan. 22, at the age of eighty-two years.

Henry M. Taylor, president of the American Vulcanized Fibre Company and vice-president and treasurer of the Remington Machine Company, died at his home in Wilmington, Del., on Jan. 14, at the age of fifty-nine years.

James Edward Latta, general agent of the Underwriters' Laboratories, died after a short illness at Washington, D. C., Jan. 17. He was a graduate of the University of North Carolina, the State of his birth, and of the graduate school of Harvard University. His engineering training was obtained at the Polytechnic Institute of Brooklyn, N. Y., at the Stevens Institute of Technology, and the shops of the Westinghouse Electric & Manufacturing Company and those of the Hooven, Owens, Rentschler Company. In 1903 he was appointed assistant professor of physics in the University of North Carolina, soon becoming acting head of the department of physics and applied electricity and after a year and a half being made professor of electrical engineering. While engaged in this work until 1909 Mr. Latta frequently was called upon as a consulting and supervising engineer in various parts of the country. In 1909 he became associated with the Edison Lamp Works of the General Electric Company at Harrison, N. J., where for seven months he conducted an employees' educational course in applied electricity and illuminating engineering. Subsequently he was engaged in power plant construction and operation in the Southwest. In the summer of 1911 he became technical editor of *Electrochemical*. When that publication was consolidated with the *Electrical Review and Western Electrician* six months later, Mr. Latta became an associate editor on the staff of this journal, having charge especially of the sections on electrical construction and inspection. In December, 1913, he was appointed special agent of the Underwriters' Laboratories, Inc., and about a year ago was advanced to the position of general agent. While making his headquarters at Chicago, Mr. Latta had traveled very extensively in all parts of the country in the last four years, representing the Laboratories at a great many conventions, meetings and conferences and helping to spread theospel of conservation by elimination of the fire hazard. It was a trip of this kind that brought him to Washington, where on Jan. 12 he was taken down with pneumonia, to which he succumbed five days later.

Commission Rulings

Important decisions of various state bodies involving or affecting electric light and power utilities.

Competitive Plant Construction Opposed Temporarily.—A decision has been rendered by the Colorado Public Utilities Commission on a petition of the Western Light & Power Company against the city of Loveland for a determination of the question whether the city had begun actual construction of its proposed electric light plant before July 16, 1917, and had since prosecuted such work in good faith, uninterruptedly and with reasonable diligence in proportion to the magnitude of the undertaking under any franchise, permit, ordinance, vote or other authority heretofore granted but not heretofore actually exercised, or whether a certificate of public convenience and necessity is required. The commission holds that the city began construction of its plant prior to the enactment of the amendment to the law requiring a certificate of public convenience and necessity to be obtained from the commission before a utility may enter territory now served by a utility. Therefore such a certificate is not required, but the municipality must now proceed under such rules and regulations as the commission may prescribe. The decision adds: "The testimony before the commission, with the estimates prepared by the municipality's engineer, shows that the cost of completing the proposed electric light plant has greatly increased since the beginning of the war; that the increase is such that approximately two dollars must now be spent where one would suffice under normal conditions. Recognizing the existence of this condition, and realizing also that the city of Loveland and its inhabitants are now well served by an existing public utility, the commission, under its authority to provide rules and regulations for the completion of this plant and in keeping with the intent of the law and the requests of the national government, will hold that the city of Loveland has prosecuted the work of constructing its municipal plant in good faith, uninterruptedly and with reasonable diligence according to the magnitude of the undertaking, and that the municipality may and shall proceed further with the construction of its municipal plant until further application be made to the commission for the municipality to complete its work, or until such time as the commission on its own motion shall authorize the municipality to resume work under more normal conditions. The rights of the national government in connection with its need of materials and labor for the proper prosecution of the war must also be protected, and

must be given consideration over other demands for materials and labor, except where such demands relate to matters absolutely essential to public welfare. It is the purpose of this commission, however, to provide that no public utility, taxpayer or person may again appear before the commission and attempt to show to the satisfaction of the commission that the municipality of Loveland has not proceeded in good faith, uninterruptedly and with reasonable diligence in proportion to the magnitude of the undertaking, until such time as the municipality may proceed under the regulations of the commission to construct its electric light plant in a manner to conserve to the taxpayers of Loveland their funds raised by the issuance of bonds or in the process of general taxation."

Value as Basis for Rate Increase.—A decision of the West Virginia Public Service Commission, on the application of Godfrey L. Cabot to increase natural-gas rates in Elizabeth and other communities, holds that the reasonableness of a proposed increase in rates is not established by a mere showing of increased cost of maintenance and operation, in the absence of evidence as to the value of the plant and equipment, and as to revenues and expenses.

New Securities in California.—From Jan. 1 to Dec. 22, 1917, the California Railroad Commission passed upon applications for authority to issue stock, bonds and notes involving the following amounts: Authorized, \$98,168,183; denied, \$2,873,283; dismissed, \$1,848,706; total, \$102,890,173. Of the amount authorized to be issued gas and electric companies had \$52,361,557, or 53.3 per cent, divided as follows: Stock, \$30,115,533; bonds, \$20,070,835; notes, \$2,175,189.

Cost of Making Record.—Commissioners of the Illinois Public Utility Commission have been placed in contempt of court in a friendly suit before the Circuit Court of Sangamon County, in which Springfield is situated. This will be in force until the Illinois Supreme Court decides whether a litigant taking an appeal from the commission to the Circuit Court shall pay the State for the cost of preparing the record. The question has been up for two years. The commissioners were before Judge E. S. Smith in response to a citation for contempt following their refusal to file the record in a case. The cost of preparing the record had not been paid. The commissioners were fined \$25 and costs, payment being suspended during the appeal to the Supreme Court. The commission bases its demands for payment on Section 7 of the Illinois Public Utility law. In the appeal of the Springfield Gas & Electric Company from a commission order the company contested payment of the fee for preparing a record, amounting to several hundred dollars. The court required the company to deposit the amount of the fee in a bank designated by the court, pending a decision upon the point. Since then contingent payment has been guaranteed in some cases.

Recent Court Decisions

Findings of higher courts in legal cases involving electric light, power and other public utility companies.

Modification of Commission Order.—An order of the Public Service Commission can be modified only by a formal promulgation, especially where the order itself provided that it should be modified "by further order," etc., it was held by the Appellate Division of the Supreme Court of New York (167 N. Y. S. 810).

Liability for Employees' Negligence.—Plaintiff was employed by defendant by the day to assist in or superintend the installation of certain heavy machinery in defendant's plant. Plaintiff owned and furnished and, without the direction or control of any other agent of the defendant, set up the windlass, pulleys and other apparatus, but the windlass was operated by defendant's employees. It was held by the Court of Appeals of Kentucky in *Danville Light, Power & Traction Company versus Baldwin* (198 S. W. 713) that if the employees operating the windlass were under the control and direction of defendant's superintendent, plaintiff was not an independent contractor, and defendant was responsible for their negligent acts causing injury to plaintiff, whether their negligence was gross or ordinary.

Municipal Rate Discrimination.—Municipalities of the State are authorized to establish, maintain and operate lighting, power and heating plants and furnish the municipality and the inhabitants thereof with light, power and heat. The powers thus conferred are proprietary in their character, and in the management and operation of such plants municipal officials are permitted wide discretion. Courts are without authority to interfere therewith upon complaint merely that the capacity of the plant is overtaxed and streets of the municipality are insufficiently lighted by reason of furnishing energy to private consumers, and that the rates charged for energy are inadequate to meet the cost of production and transmission thereof, it was held by the Supreme Court of Ohio (117 N. E. 953). But where the council of any such municipality fails to adopt and use a system or schedule of rates for energy furnished to private consumers as contemplated by the General Code, but leaves the matter of rates to the administrative officers of the municipality, who arbitrarily fix and determine the rates in each case, and in so doing unjustly discriminate between citizens in the matter of rates and service, such action constitutes an abuse of corporate power which may be restrained by the court upon suit instituted by the city solicitor or by a taxpayer if the city solicitor refuses to bring suit.

TRADE & MARKET CONDITIONS

News of the Trade for the Manufacturer, Wholesaler and Jobber
of Electrical Equipment and Supplies—
Notes on Industrial Activities and Business Methods

TAKING CARE OF THE MORAL-RISK CUSTOMERS

Things That Can Be Done After Credit Is Extended
on Character to Help Insure Payment
of the Account

When the credit man has been prevailed upon to pass a customer's order and that customer has no collateral backing or dependable asset but his character, the time is opportune for the credit man to strengthen the customer commercially. The logical point to start would be with the customer's credit relations with his own trade.

The chances are that the facilities of this customer for securing credit information are very meager. On the other hand, the credit man has many sources of credit information at his command. This may be explained to the customer, and it may be impressed upon him that the credit man is almost a partner in his business on account of the credit extended, and also because disaster may overtake him if proper precaution is not exercised in his credit dealings. The credit man need not hesitate about virtually insisting that this customer call on him for information, especially in transactions where comparatively large amounts are involved. If the credit man will come down to his customer's level and give him proper assurance of his willingness to assist in this capacity, he will no doubt be surprised to find how careful the customer becomes and how often he consults the seller's credit man.

However, when the credit man has established such relations with the customer it will soon become evident that this customer needs suggestions in reference to the importance of properly closing orders and contracts, especially taking into account terms of sale. It is not an uncommon occurrence to find well-financed concerns taking advantage of the small man in business because he lacks backbone when soliciting the business or harbors a fear of losing the business if terms of sale are mentioned. The customer in these instances knows very well that he cannot afford to give long terms, and it is up to the credit man to bolster him up a bit and to teach him the real meaning of quick turnovers. In some cases it may even be expeditious for the credit man to make collections for the customer, so that both may receive payment without waiting for the remittance to come strolling along as the small man usually does.

MORE EVIDENCE OF BETTER TRADE MERCHANDISING

Habirshaw Electric Cable and Western Electric Put
Out "Home Electrical" Manual to Facilitate
Co-operation

A still further evidence of the growing tendency of the electrical industry toward a better and broader plan of merchandising is contained in "The Home Electrical" manual now being distributed by the Habirshaw Electric Cable Company and the Western Electric Company, which distributes the former's products. It is designed to "deliver complete electrical equipment to the ultimate consumer at the lowest possible cost consistent with dependable materials and skilled workmanship." The execution of this merchandising policy involves, its sponsors state, "first, the preparation and distribution of correct plans and specifications for the use of the architect; secondly, a duplicate of the architect's plans and specifications to be placed in the hands of electrical contractors; third, a practical working plan of distribution and a stabilized basis from which

contractors and architects can closely estimate the investment for materials of the plans for each installation."

To this end the manual is being distributed. It contains complete plans and specifications which can be used by architects and contractors, either in whole or part, as an example to their clients of an installation for the home.

In distributing this manual the publishers state that the data contained therein were compiled from the most reliable sources and represent the best market practice. It is intended to answer all of the questions that may arise between the architect, contractor and owner in considering electrical equipment for the house.

FAN SCHEDULES FOR 1918 ANNOUNCED TO THE TRADE Selling Policies—Price Differentials Formulated— Matter of Shortage in Question—New Standards Noticed

Fan manufacturers have announced their schedules, contracts, selling policies and other information incidental to the campaign for 1918. Heretofore a differential of about \$1 each was made in the price of alternating-current and direct-current fans. This year the same practice was expected to prevail, as a difference in the manufacturing cost of the two types is claimed. On this account the schedule, it is reported, were held back longer than usual, some firms just now sending out their formal notifications. It appears that one leading producer has named the same price for both, but a majority of the remaining concerns adhere to the differential of former years.

As was pointed out in the ELECTRICAL WORLD for Oct. 1, the 1918 fan shows many new standards. The standard type will have four blades, although six blades are cataloged, in the 12-in. and 16-in. alternating-current oscillatory types. Likewise a lower figure is named for certain models on the same outlines of the more expensive kind, its reduced price being due to the absence of the speed-control switch, highly polished blades and the omission of other requirements not required for reliability and durability. Eight feet of new code reinforced cord is supplied with each fan, though six feet is specified on some less expensive types.

An increase in price of both oscillating and non-oscillating models is made in the 1918 lists, ranging from \$3 to \$4, \$4.50 and \$5 each, a little more than originally foreshadowed in the ELECTRICAL WORLD. This is owing to the increased cost of raw material and production. One house states in its printed notice to the trade, that it "cannot undertake to guarantee fan-motor prices against advance during the season of 1918 in contracts made with either wholesalers or retailers."

Discounts also vary, according to methods in vogue between the manufacturers and buyers, the greater number adhering to the quantity basis plan. A prominent producer who has followed this rule in his other lines is putting it to work on fans this year for the first time. Discount arrangements are subject to various considerations and differ with each of the manufacturing companies.

The fan-selling season proper is usually during the last quarter of the year. Delivery of requirements are to be made before the expiration of the contract date. The buying so far on the part of jobbers and dealers is understood to exceed that of last year. Much speculation has been indulged in as to a shortage of fans. Authorities agree and disagree on this point, but one of the largest distributing companies has already announced, and in a public manner, that "there is sure to be a shortage of fans next summer."

BUSINESS IN MOTORS

REMARKABLY SOUND

Large Buying Expected to Develop for Small Units
for Industrial Drive to Displace Many Large
Units Now on Group Drive

The well-sustained volume of business in electric motors under all vicissitudes of trade speaks well for the future of this branch of electrical manufacturing and distribution. While *less essential* industries—there are few really "non-essentials"—show declines in purchasing, the acceleration in military and naval preparations throughout the country absorbing practically all the motors which can be built, and deliveries on the largest sizes are fast approaching a year, including both freight and express delays. The first rush of munitions plant requirements led to a heavy volume of large unit buying in the motor trade, group drive being necessarily first installed on account of its lower first cost, the latitude available in reserve capacity in many installations, minor importance of electrical efficiency at the start of war operations, and general overload characteristics. At present the volume of this large-motor business is still very great, but the increasing importance of fuel conservation through the use of more efficient power equipment is leading to a more general consideration of industrial motor-vehicle betterment problems. This means that more and more smaller motor units will be required to handle existing and developing loads, and well-informed opinion is that after the war and perhaps earlier the large-motor market will be overstocked through the release of many units now operated upon an inefficient basis and the substitution of small units for individual or subdivided group driving. The fuel shortage has focused attention upon the value of hydroelectric energy, and the outlook for profitable motor business and economic applications is nothing less than remarkable, taking the long view ahead. Power users recognize the necessity of maintaining motor prices at levels yielding a fair profit to the manufacturer and distributor, and the indications are that no branch of the electrical manufacturing industry faces brighter prospects to-day.

METAL MARKET SITUATION

Stronger Sale of Copper Is Looked For—Wire
Products Easier—No Tin in Sight

Wire prices, while being figured on a 30-cent base, are looked for easier, with a tendency to softness. Large consumers are buying practically at their own price but with reservations. The extension of the official price of copper for four months ahead has had a stabilizing effect, and purchases of the metal may be on a more liberal scale. Transportation, labor and other difficulties are having their effect on industrial consumers of copper, more so than on producers. The consumer is dependent on a doubtful and unsettled domestic demand, which is unsettling. If under current conditions the output shall exceed consumption, it will have an effect on the price that will rule after the present term expires. Other metals remain about the same, excepting tin, which is scarce, with no relief in sight.

NEW YORK METAL MARKET PRICES

Nominal.		

THE WEEK
IN TRADE

STORMS and embargoes have held up freights in all parts of the country, excepting in the South, during the week so that deliveries were not greatly improved, if at all. In some instances the delay is reducing electrical stock to a point where jobbers and dealers are disturbed over the outlook. With this temporary check, however, sales and trade in general are reported as increasing. Where business was practically suspended on account of the blizzards, the normal status is resumed. The labor shortage is becoming more acute where large industrial enterprises of a government nature are centered. A shortage of new motors is said to exist in some sections, but used machines are selling better elsewhere owing to shorter deliveries. Fixtures, washers and heavy equipment are recorded in the improved sales class.

Collections range from fair to excellent, January being said to be better than December. Industrial accounts are particularly prompt in settlement. Credits continue to be carefully looked after.

NEW YORK

Concern over the slow delivery of goods is expressed by representative jobbers and distributing houses. It is said that manufacturers who are unable to carry out their time contracts are offering various excuses for the non-delivery of electrical merchandise, the greater number of which are not only valid but are governed by circumstances which they are powerless to remedy. The buying of staples continues along conservative lines. Heating appliances are coming into the market in larger lots, but a scarcity still exists. Wiring material is slightly easier in price. Collections have been impaired by the severe weather, but credits are still treated with a great deal of circumspection.

A jobber, with a wide reputation as a heavy operator in every line of electrical staples, specialties and general merchandise, is revising his entire price list. Notable changes are not exactly the purpose of the revision, but there may be surprises in store. The new list is down for appearance along in February, and in certain instances the figures are to harmonize and tie up with the Goodwin plan of buying and selling, which is interesting the trade.

SMALL MOTORS.—While deliveries for standard sizes are better, prices have also receded slightly, but not so much as to affect conditions a great deal.

LAMPS.—Manufacturers are gradually catching up on past shortages on standard sizes, but some types are still short. With the anticipated demand for large quantities of all kinds of lamps that the government will doubtless requisition in the near future, to meet the requirements of the vast housing preparations of the Shipping Board, now under way, it is possible that the situation may be again seriously affected.

ELECTRIC RADIATORS.—Marked efforts are being made to push through a number of important shipments of electric radiators to meet the extraordinary demands in New York City and neighboring places.

COLLECTIONS AND CREDITS.—As mentioned in a previous review, the holding up of freight—the exasperation connected with the slow arrival of merchandise—has had a shrinking effect on collections, which have heretofore been quite satisfactory. The credit managers are exercising their usual care in disposing of applications for time accommodation in opening accounts.

LIGHTING FIXTURES.—Trade is still rather quiet, owing to the practical elimination of building operations. A well-known firm just issuing its new price list is making a few slight increases on fixtures having heavy brass castings,

but on the regular line a shade lower is noted—an "even break," as the house expressed it. Bowls, shades, etc., are spoken of as being in ample supply, with shipments from the factories coming out of stock. Deliveries are three and four months back.

FLASHLAMPS.—Trade in flashlamps is very active, the recent advance apparently not affecting the sale appreciably. It is a question just now of obtaining stock.

CROSS-ARMS.—With the rapid absorption of the visible stock of cross-arms for cantonment and general government purposes, the supply is growing less. Prices, as stated last week, took a jump, and if a further increase should come along large handlers would not be surprised.

HOUSEHOLD SPECIALTIES.—Excepting heating appliances, the sale of household energy-consuming specialties has been affected to some extent by the conservation of energy by the central stations. Goods of this description are expected to move more rapidly when the fuel-saving situation is not so acute.

CHICAGO

The trade has recovered from the blizzards and is back on a normal basis. During the stormy days when shipments were not made on account of lack of transportation facilities orders piled up to an appreciable extent. These have all been filled and shipped now. Heatless Monday was a boon to some jobbers. The railroads were not receiving freight, but were giving all assistance in getting incoming shipments unloaded. This permitted jobbers to put their entire merchandise handling departments to work on the incoming shipments with the result that goods were received, checked and shelved in one day, whereas, in the ordinary run of things, the handling of the same volume would have taken a week. The lull in business that usually follows the inventory period is reported to be about over and normal movement being slowly resumed.

COPPER.—To some observers the future price of wire to the trade is a puzzle. The government has of course fixed the price of ingots at 23.5 cents. Ordinarily the mills formerly got about 1 cent a pound for working it up. Now they get, on account of labor conditions, from 3 cents to 4 cents, bringing factory prices on wire up to 26.5 cents to 27.5 cents. The Chicago jobbers are at present continuing on a 30-cent base for rubber-covered and a 28-cent base on weatherproof.

MOTORS.—Sizes smaller than 15 hp. can be had on immediate delivery. The large sizes are more scarce.

SECOND-HAND MACHINERY.—Bad weather has interfered with inquiries in the last few weeks. This slowing up is regarded as temporary. Prices show no signs of breaking. In fact, some buyers are paying more for second-hand motors than they would have to pay for new motors out of stock owing to the panicky condition of the market. The outlook for 1918 is considered good, the usual run of factory changes being looked to to produce much of the business. Analyses of 1917 business show that the volume of business in dollars was greater than that of 1916, but that the tonnage was just a trifle under that of 1916.

MERCURY-VAPOR LAMPS.—The large amount of industrial night work that is going on is making a real market for mercury-vapor lamps. One company's 1917 business in the Chicago district increased 43 per cent over that of 1916. Deliveries on direct-current lamps are on about a ten-day basis. Deliveries on alternating-current lamps are on about a three-week basis.

LAMP GUARDS.—Industrial activities and the higher price of lamps are making a lively market for lamp guards. Government orders in the hands of some manufacturers have set back deliveries from out of stock to ten days.

CEDAR POLES.—Lack of transportation facilities and slowing up of utilities' activity have acted to create large stocks of poles in the hands of distributors. The 1918 pole buying is expected to be about 50 per cent of that for 1917.

FUSE SWITCHES.—A few large orders have been received, and these tend to make the market continue to appear active.

BOSTON

Jobbers report a reasonably good volume of business with but a slight falling off due to the enforced holidays and weekly shutdown. Stocks are substantial, although railroad embargoes and congestion are hampering deliveries sufficiently to retard considerably the replacement of shipped materials. No let-up appears in government orders, and important consignments are being billed for foreign use as well as for service in military and naval establishments on this continent. House wiring is very quiet over New England as a whole. Central stations are recovering somewhat from the effects of the "heatless Monday" order, as additional exemptions are provided.

Prices hold firm in most lines, but an advance in washing machines is rumored to be in prospect. Central stations report good results from vacuum cleaner campaigns now under way, the Feb. 1 price advance being a decided stimulus to earlier installment buying. Labor is getting scarce and the more general use of women in industry cannot long be deferred. One prominent jobber reports a 20 per cent larger trade in December than a year ago, with large mil business, running as high as \$30,000 per annum in an individual case. Collections are fair, and from industrial customers excellent.

The Massachusetts Gas and Electric Light Commission also has just made public a statement emphasizing the fundamental soundness of the central-station industry and the expectation that dividends will continue along present line despite the adverse effects of the war.

MOTORS.—A prominent dealer states that 90 per cent of the motor business of New England is associated with the war industry, and that the volume of sales shows no sign of falling off. On motors of 75-hp. rating and over nine months' delivery is being quoted. Prices are firm, and the above dealer is of the opinion that there are not over 50 motors in New England stocks ready for instant shipment. Illustrating the present scarcity, \$200 was lately paid for a dozen frames of motors of 1-hp. to 5-hp. rating, with windings totally ruined by overheating, and in other cases higher prices are being paid for second-hand than for first-hand units, because of better delivery conditions.

WIRE AND CABLE.—Stocks are increasing, at least temporarily. One large manufacturer reports putting the first stock order through the works for many months, covering varied sizes. Weatherproof wire is quoted at 27 cent and rubber-covered at 30 cents.

ELECTRIC PASSENGER CARS.—The scarcity of chauffeurs and good performance of electric vehicles in Boston during the cold weather promise a healthy spring business. Consistent work among suburban "prospects" is yielding results; power requirements are relatively small, and when intelligent sales methods are applied growth of business seems certain to follow.

VACUUM CLEANERS.—The drive to sell these machines in larger numbers prior to the advance of Feb. 1 gave every evidence of success early in the week. Cleaners are becoming almost as much of a staple as electric irons, and few are returned after being placed on trial.

FLASHLAMPS.—Business shows a slight falling off late. If the second draft comes early in the spring, a boom in these devices is expected to follow.

CONDUIT.—Smaller sizes of pipe are accumulating in the stockrooms, but deliveries are in general irregular and much of the local buying in New England is on the hit-or-miss order.

ATLANTA

No visible effects of the embargo on some of the Eastern railroads have been noticed in the Southeast this week. As a matter of fact, this section is too busy with other problems since last week's industrial dislocation by the fuel order. The various hydroelectric power companies rendered invaluable service during the period of shutdown and are rewarded by the fact that a number of essential industries were kept running. A sleet storm visited this section early in the week and caused considerable damage, tying up street-car service and crippling lighting and power systems.

all telephone, telegraph and power lines are reported as repaired, and practically normal conditions prevail. There is a movement to restrict unnecessary building and other enterprises not essential to the war and to save capital investments for war bonds, the idea being to appoint local committees of business men and bankers and intrust them with the task of cutting off at the source proposed expenditures which can be eliminated during the war. It is not expected that this movement will make much headway for some time. Anyway, a large volume of construction has already been projected and the momentum of this business will continue for some time.

Manufacturers and jobbers state that collections are excellent and that January is showing up much better than December. A number of municipalities which are unfortunately not situated near hydroelectric systems are being hard pressed for ready funds, owing to the fuel situation. These seem to be the only cases materially affecting the credit outlook at present.

LIGHTNING ARRESTERS.—Heretofore the demand for this line was more or less sporadic, but expansion of transmission systems in the Southeast has tended to flatten out the demand. Manufacturers report that last week's thunderstorm stimulated sales and brought to the attention of operating engineers the necessity of anticipating summer requirements. The aluminum-cell type has been quite effective, but deliveries are slowing up. Manufacturers report great difficulty in securing steel containers and aluminum. Arresters for 6600 volts and below are promised for two months. Higher potentials cannot be had in less than five months, with the possibility of even longer shipments. There has been no decided change in prices recently.

ELECTRIC HEATERS.—The call for heaters of all types has been good this winter and a large volume of sales has been recorded, but when the recent five-day fuel order made itself felt the demand for heaters was more than local and scattered stocks could stand. From information at hand it appears that all the heater stocks are exhausted, and as there will be eight more heatless Mondays the prospects are very bright for more big business in this line.

SEATTLE

There were no outstanding features in the past week's business. Jobbers say that the volume of sales to shipyards, lumber mills and industrial plants was noticeably less than during the last three weeks. Sales to the government were also negligible, with the exception of orders for lamps and wiring devices for additional cantonment work. Retailers report a noticeable increase in volume due to the incipient building boom in Puget Sound cities. This volume is expected to increase. Several inquiries from a big shipbuilding concern and allied industries for heavy equipment indicate that February's total, provided orders are placed, will be heavy. Few new credits were placed during the past two weeks. Collections are satisfactory.

Seattle apparently is experiencing a building boom as regards the erection of residences. Opinions differ as to whether the present rate of construction will continue. In spite of the fact that January is regarded as a particularly unfavorable month for building activity, 130 new residences were started during the first twenty-eight days.

The establishment of many camps and portable sawmills and construction of new railroad lines in the Grays Harbor country will follow the recent award of the government of the contract for millions of feet of airplane spruce on the "cost plus" basis. The contract for furnishing more than 100,000 worth of machinery, including a large amount of electrical equipment, was awarded last week by a new Grays Harbor shipbuilding concern.

The freight situation in the Northwest remains the same as reported for the past month. There has been no speeding up, and over 5000 carloads of Oriental freight in Seattle yards and hundreds of carloads in warehouses block the efforts of railroads to solve the traffic problem. To relieve this congestion and prevent a railroad embargo, steamship and railroad officials representing all the principal lines have agreed to a steamship pooling arrangement designed to facilitate the quick handling of freight and to be used only in

case of necessity. The embargo on the shipment of freight other than fuel, food or munitions now in effect on Eastern lines has not been emphasized to date, although it is expected to materialize.

Appliances as a whole are moving satisfactorily. Jobbers state that the sale of sewing machines during the month of January has never been equaled in the Northwest. Immediately following the holiday let-down this appliance began to move and this movement is increasing daily. Dealers state that the Christmas sales of machines have proved the best advertisement possible. Stocks of appliances are fluctuating considerably, but at present are in fair shape. Floodlamp sales have been on a decided increase the past two weeks and a slight shortage is noted. Portables are moving satisfactorily and shortages on other lamps are very pronounced. The volume of sales is well sustained. Motor and transformer sales slowed up slightly during the past week. No orders of important consequence were placed.

SAN FRANCISCO

The long-continued drought in California is causing much concern in all lines of business and there is apprehension that the coming year will see hard times because general prosperity in California is so closely related to good crops. For the time being, however, the drought is bringing a rush of motor and transformer business from farmers who desire to install pumping systems to insure water supply. During freight clearance week more than 3500 freight cars were released in California. The saving of 20,000 kw. which was available immediately after the consolidation of the four large power companies has provided power for immediate needs, and this load is rapidly being absorbed chiefly in comparatively small blocks.

Shipyard activity is steadily increasing, and as the first boats are launched new keels are laid so that there is a steady demand for electrical supplies in that line. Renewed activity in building construction is in prospect in San Francisco. The building inspector's office announces considerable more business in the month of January than was done in the preceding three months combined. New contracts are for industrial loft, light manufacturing and automobile uses. No hotel, office or apartment buildings are included.

CREDITS AND COLLECTIONS.—These continue in good shape. The readjustment to business on a war basis seems to have been completed even in the retail shops, and concentrating on lines that can be moved now has improved business conditions. Credits are still scrutinized closely and overstocking on a high-price basis is being carefully avoided.

LAMPS.—The situation remains in a strained condition, and dealers are inclined to complain about the difficulty of securing supplies, but in reality actual needs are adequately handled as heretofore.

WIRE.—Rubber-covered wire stocks have been seriously depleted of late by the slowing down of deliveries without corresponding decrease in demand. Despite this condition a tendency to a lower price is reported. Weatherproof wire stocks are also in worse shape than before, but are not so bad as rubber-covered.

CONDUIT.—Stocks are in worse shape because of poor deliveries. However, demand in this line is below normal, the chief fields now being the government and industrial.

GLASS INSULATORS.—In this line considerable uncertainty has arisen because of the manufacturers' announcement that orders will be accepted only at prices as of date of shipment. The fact that shipments are poor adds to the uncertainty.

POLE-LINE HARDWARE.—Since the first of the year construction has dropped off. Good stocks are in hand.

MOTORS.—The demand for agricultural purposes is increasing. The question of delivery is now entirely a matter of a priority order. The Priority Board is very careful and only unquestionable claims are allowed. Stocks are continually improving. One manufacturer, for example, who recently quoted stock delivery on single-phase motors up to 15 hp., later moved this up to 20 hp. and now quotes up to 30 hp. from stock.

Current Prices of Electrical Supplies

New York and Chicago Quotations

THE prices quoted are those prevailing in standard packages of specified lots on apparatus and appliances in Eastern and Middle West markets at the beginning of business on Monday of this week. They are in all cases the net prices or prices subject to discounts from standard lists of contractors, central stations, dealers and others engaged in the resale of such goods.

Prices in Southern and other nearby markets will rule about the same as those in the Middle West, although slight modifications to cover increased freight and local demands should be expected. In the Far West and on the Pacific Coast the prevailing prices are naturally higher, covering as they must

increased freight and the necessity of larger stocks with increased interest and warehouse charges on account of the distances from sources of supply, infrequent turnover of stock and uncertainty as to delivery of goods in transit. Moreover, the Far West presents a wide variation in demand due to a small population spread over a wide area in agricultural and mining communities, as contrasted with the denser population of the East and Middle West, their nearness to the sources of supply, the more frequent turnover in stocks and the constant demands which arise in industrial centers. Price variations may be due to difference in grade of products of different manufacturers, to local conditions, or to both.

NEW APPARATUS & APPLIANCES

A Record of Latest Developments and Improvements in Manufacturers' Products Used in the Electrical Field

Porcelain Concealed Receptacles

Pass & Seymour of Solvay, N. Y., have brought out two porcelain concealed receptacles, to be known as P. & S. 4000 and 4001. The wires are introduced from the back of these receptacles.

RECEPTACLES WITHOUT AND WITH
SHADE-HOLDER GROOVE

cles. The outer porcelain shell entirely conceals the supporting screws as well as the binding screws and terminals. P. & S. 4000 is shown without the shade-holder groove and P. & S. 4001 with the shade-holder groove. The outside diameter of the base of these receptacles is $2 \frac{5}{16}$ in. (5.87 cm.).

Pumps and Pumping Outfits

The Goulds Manufacturing Company of Seneca Falls, N. Y., is placing on the market a new line of "Hi-Speed" pumps and pumping outfits that are supplied in 3-gal. and 6-gal. (11.4-l. and 22.7-l.) sizes. This line consists of thirteen outfits, twelve of which are motor-driven. It is pointed out that the small capacity is ideal from the central-station standpoint in that it carries the pumping over a longer period of time, thereby doing away with the objection of having pumps of larger capacity operating for only a few minutes during the day. Attention is called to the interchangeability of the

INTERCHANGEABILITY OF COMPONENT
PARTS A FEATURE OF THESE PUMPS

component parts. This interchangeability of component parts, it is said, will enable the dealer, by having one complete outfit in stock and various extra parts, to make up any one of the thirteen different outfits. Four of

these outfits are supplied with 32-volt motors, making the outfits suitable for operating from farm lighting sets.

It is pointed out that all gears have been eliminated, thereby making the pump absolutely quiet and smooth-running. The pump operates on a speed of 500 r.p.m. This allows it to be belt-driven from either electric motors or gasoline engines with only a slight reduction and consequently with a small pump pulley instead of the extra-large pulley usually required.

Industrial Floor Trucks and Tractors

The special features pointed out for the electric industrial floor truck shown herewith, made by the Enterprise Machine Works of Los Angeles, Cal., is turning in wheel-base length, simple in its make-up, low first cost, low upkeep, speed control system without resistance, 25 per cent reduction in weight. This truck is said to be the first floor truck to be placed on the market that demands from the storage battery a current supply below the normal rate of discharge.

The truck is equipped with a special

NON-RESISTANCE SPEED-CONTROL SYSTEM
USED

high-speed four-pole motor, running on Hess-Bright ball bearings, mounted on the yoke over the traction wheel and geared thereto for propulsion and steering of the truck. The Haschke non-resistance speed-control system is used. The battery is always in series, and the three speeds are obtained by cutting out (harmoniously on each pole piece) field coils. It is equipped with a speed controller, consisting of a single switch blade conveyed into three switch jaws, and is the only continuous torque control system on the market. The control of the motor can also be operated by the foot brake automatically. As standard equipment a fourteen-cell, fifteen-plate battery is used, either Gould, Exide or Philadelphia make.

Steering is accomplished by mounting direct to the steering head a large-size automobile steering wheel. The steering head revolves in a Timken

roller bearing and has two projecting arms terminating with small ball-bearing wheels running on a circular track, to withstand rough roadbed operating.

Light Controller

The automatic light controller here described is placed on the dash under the hood of an automobile and requires no adjustment or manipulation by the operator of the car. By means of a moving armature, which is automatically pulled under a magnetized field as the car speeds up and drops out as the speed decreases, the lights are kept practically constant throughout the range of speed of the car. It is manufactured for use on Ford cars in which an alternating-current magneto is used. The controller operates on the impedance or reactance principle. The American Sales Corporation is the sole distributor in the United States, with headquarters at 614 Fulton Building, Pittsburgh.

Cable Potheads

The Philadelphia Electric Company Supply Department of Philadelphia has placed on the market a cable pothead in which the base member consists of two parts so arranged that when they are screwed together they serve to clamp the lead sheath, forming an effective waterproof and so derless joint. The inner members form a static shield of the pothead and are constructed as to provide a gradually diverging concentric continuation of the inner surface of the metal sheath. By means of this form of construction the bellling effect can be reduced to a minimum, resulting in a compact design. When completely assembled the entire surface is surrounded by a compound which eliminates all air from this surface and distributes with absolute uniformity any static strain which arise, it is claimed.

The body of the pothead is con-

DETAILS OF PRINCIPAL ELEMENTS

structed of fiber, porcelain or metal dependent upon the class of service required. The cover is furnished with either disconnecting or non-disconnecting terminal bushings and is made of composition, porcelain or metal.

Electric Motor Clamshell Bucket

The Hayward Company, 50 Church Street, New York City, is manufacturing the electric motor bucket shown herewith. This bucket, as the name indicates, has as an integral part a

EQUIPPED WITH MOTOR-OPERATED WINDING MECHANISM

motor-operated winding mechanism which opens and closes the jaws of the bucket, making it an electrically operated unit. Attention is called to the fact that an important feature of this bucket is the introduction into the transmission of a multiple-disk clutch, its function being to slip and permit the motor to continue to run in case the edges of the bucket come together or are held apart by some obstruction, while the controller is in the closing position. This eliminates the necessity of limit switches, circuit breakers or similar devices, and makes the bucket practically "foolproof" in the hands of the ordinary crane operator.

Receptacles

P. & S. 4003, which is a companion piece to P. & S. 437, is a short-backed receptacle furnished with 6-in. (15.2-cm.) leading-in wires and has been de-

DIFFER ONLY IN SIZE OF BACK

veloped by Pass & Seymour, Solvay, N. Y. P. & S. 4035 is a screw-ring sign and outlet-box receptacle of the same series as P. & S. 437 and P. & S. 4003 and differs from P. & S. 4003 only in that it has a 1-in. (2.54-cm.) back.

Color-Matching Unit

The Nela Specialties Division, Nela Park, Cleveland, Ohio, has developed and is marketing the new "Trutint" units, one a portable color-matching unit, the other a pendent unit. The pendent unit is a substantial fixture of pleasing design, made of spun brass, regularly furnished with a cloister finish. Other finishes may be obtained on special order. This unit is suitable for hanging over a showcase or counter.

The portable unit fills a demand for a color-matching unit suitable for use in high-class shops and stores. It is neat, of pleasing appearance, compact, substantial and adaptable to almost any service that may be desired of a color-matching unit. The reflector is of spun brass, the arm of steel, both heavily nickelled. The base is of iron, finished in black. The unit is recommended for use on counters or show-cases of shops of the highest class.

Heat Regulator

The Western Electric Company of New York is offering to the trade a heat regulator which, it is said, prevents the overheating of the furnace and thus the wasting of fuel. It permits the maintaining of comparatively low temperature at night and at a predetermined hour in the morning will automatically open the drafts.

A thermostat is mounted on the wall on the first floor. Connected to this is a cable running to a motor in the basement. A change of the room tempera-

BATTERY-OPERATED HEAT REGULATOR

ture on the first floor of 1 deg. causes an electrical impulse to be sent to the motor box, and the drafts will be opened or closed as required. This device will regulate the underfeed draft and the check damper of either hot-air, steam or hot-water furnaces. It can also be applied so as to govern the main valve on gas, municipal or community steam-heating plants.

Two types are made, one for homes that are not wired for electricity where two cells of dry batteries on a substantial spring motor are furnished. The other type is used in homes wired for electricity. This is equipped with an alternating-current motor and a transformer to furnish low voltage for use on the thermostat circuit.

Master Switch

The master switch shown herewith has an "inching" button as well as a starting and stopping button. When the "inching" button is pressed the motor circuit is closed, but the starting resistance is not short-circuited, conse-

EQUIPPED WITH AN "INCHING" BUTTON

quently the motor starts, but only runs at a low speed and stops immediately pressure of the "inching" button ceases. This switch is a product of the Igranic Electric Company, Ltd., of London, Eng.

Electric Monorail Hoists for Handling Ashes

A monorail electric hoist with a bottom dumping bucket for handling ashes is made by the Link-Belt Company of Chicago. This machine runs on the lower flange of an I-beam track. It is operated by a man traveling in a trailer cage who controls the raising or lowering of the bucket as well as the travel of the hoist. The laborers who clean the fires fill the bucket with ashes; the operator then hoists the bucket and runs it out directly over the car, where it is dumped by the motion of a lever in the cage.

The machine is very compact and requires little headroom—an important consideration in an installation where it is necessary to get a large bucket over the side of a high-side gondola car.

INSTALLED IN BOILER ROOM

In many instances, an overhead bin cannot be installed for lack of space. It may then be practicable to use the same monorail hoist system to handle the coal as well as the ashes. Better even than this, a bucket with a small cnuite and under-cut gate is often used.

Trade Notes

THE ARNOLD COMPANY, constructing engineer, 105 South La Salle Street, Chicago, has discontinued its New York office at 111 Broadway.

THE CRESCENT ELECTRIC MANUFACTURING COMPANY of Pittsburgh, Pa., recently bought the entire stock of the Pittsburgh Armature Works.

R. J. MORGAN, formerly supervisor of sales for the American Steel Export Company of New York City, has been appointed assistant general manager of sales.

THE PETTINGELL-ANDREWS COMPANY of Boston, Mass., will open a branch soon in the Back Bay for distributing storage batteries and automobile supplies.

THE EMIL GROSSMAN MANUFACTURING COMPANY of Brooklyn, N. Y., on Jan. 13 held a winter meeting of the salesmen and department heads. A luncheon was also held. The company's executive staff was present.

THE CHINA PRODUCTS COMPANY of Zanesville, Ohio, has purchased the Virginian Potteries Company, its plant, manufactured products, tools, fixtures and raw materials. Possession was delivered to the new owners Jan. 30.

THE WAGNER ELECTRIC MANUFACTURING COMPANY of St. Louis, Mo., announces the opening of a service station at Seattle, Wash., to take care of this branch of its business in the State of Washington and the Northwest.

H. H. MILLER, formerly employed by the Doubleday-Hill Company, Pittsburgh, Pa., has accepted a position with the Square D Company of Detroit. Mr. Miller will cover the Pittsburgh territory, working in conjunction with D. M. Stone, manager of that district.

THE WESTINGHOUSE LAMP COMPANY of New York City has removed its advertising department from 165 Broadway (City Investing Building) to the Park Row Building, 21 Park Row, opposite the General Post Office. It has taken a suite of offices on the sixteenth floor.

P. C. GUNION has been made advertising manager of the industrial bearings division of the Hyatt Roller Bearing Company, Newark, N. J. Previous to his recent appointment he was manager of the company's office in Pittsburgh, Pa., and for two years was in the sales department.

FRANK J. FOLEY, formerly manager of the mining department of the Westinghouse Electric & Manufacturing Company, on Jan. 1 became connected with the Edison Storage Battery Company, Orange, N. J., as manager of the mining and traction department, with headquarters at the main office.

THE ESTERLINE COMPANY of Indianapolis, Ind., announces the appointment of the F. R. Jennings Company, 616 Ford Building, Detroit, Mich., as its sales representative for graphic instruments for Michigan. Mr. Jennings will handle that entire State for the Esterline Company, with the exception of the northern peninsula, which is taken care of by the Milwaukee office.

THE ERNER-HOPKINS COMPANY, Columbus, Ohio, held its annual sales conference and dinner in the Athletic Club rooms on Jan. 10. Twenty-seven men were present. Addresses were made by M. A. Dixley, vice-president and general manager; J. T. Dunnick, secretary, and V. G. Eastman, sales manager. Reports of the officers showed that the company had enjoyed one of the best years in its history.

C. H. SANDERSON, formerly assistant chief engineer of the Havana Electric Railway, Light & Power Company, Havana, Cuba, is now manager of the auto and truck departments of the Frank G. Robbins Company of New York and Havana. Mr. Sanderson will handle gasoline and electric pleasure cars and trucks, as well as storage batteries, and will also be in charge of the garage, machine shops and charging station in Havana and the sales and service work for the entire island.

THE MERCHANTS' ASSOCIATION of New York City has issued in pamphlet form a report of five conferences between employers and representatives of the British Ministry of Munitions. It is entitled "Readjustment and Operation of Industry in England Since 1914," and, besides the conference details referred to, also gives a summary of five additional conferences between a special commission from the British government and many employers of New York City, northern New Jersey and Connecticut. Copies may be had on application to the Merchants' Association.

THE WESTERN ELECTRIC COMPANY of New York City about the middle of the month will remove its distributing staff—clerical and heads of departments—from 483 West Street to the Broadway-Fifth Avenue Building, 221-225 Broadway and 149-151 Fifth Avenue, at Twenty-first Street. The company will occupy the thirteenth, fourteenth, fifteenth and sixteenth floors, comprising an area of about 45,000 sq. ft. The engineering department of the local company was cramped for room, and in order to provide for its expansion additional quarters were required. The new place is leased for a term of years.

THE BENJAMIN ELECTRIC MANUFACTURING COMPANY held its annual pre-holiday meeting on Dec. 21, 1917, at the Aiken Institute, Chicago. The annual meeting day has for several years been a sort of holiday. More than 500 persons attended the meeting this year. The remembrance to each employee was based on a Christmas present of \$5, plus \$1 for each year the employee had been in the service of the company. A few were present who received \$20 in their envelopes, which marks the extreme length of service, for the Benjamin company is a little more than fifteen years old. R. B. Benjamin, president, and W. D. Steele, vice-president and general manager, addressed the employees.

Trade Publications

SALES SERVICE.—The Society for Electrical Development, Inc., New York City, is distributing the February number of its *Monthly Sales Service*.

INDUSTRIAL TRUCKS.—The Enterprise Machine Works of Los Angeles, Cal., have prepared a folder descriptive of their electric industrial floor trucks and tractors.

MOTOR EQUIPMENT.—Motor equipment for textile service is described in leaflet 3910, prepared by the Westinghouse Electric & Manufacturing Company of East Pittsburgh, Pa.

LIGHT CONTROLLER.—The Barrett automatic light controller for Ford cars is described in a leaflet prepared by the American Sales Corporation, 614 Fulton Building, Pittsburgh, Pa.

MOTOR-GENERATOR SETS.—The Electric Specialty Company, Stamford, Conn., has prepared its bulletin No. 212, descriptive of its motor-generator sets for battery charging and signal work.

VACUUM PUMPS.—Bulletin 52, descriptive of Rees roturbo patent rotary jet vacuum pumps for surface condensers, is being distributed by the Manistee Iron Works Company of Manistee, Mich.

FLOOR-POLISHING MACHINE.—The Dale-Rey Corporation, 25 Church Street, New York City, has prepared a circular descriptive of its electric polishing machine for waxed floors of wood or linoleum.

LAMP PRICE SCHEDULE.—The Westinghouse Lamp Company is distributing its new price schedules effective Jan. 1, 1918. This schedule includes list-price changes on Mazda and metallized-filament lamps.

LOCOMOTIVES.—The Baldwin Locomotive Works of Philadelphia, Pa., are distributing record No. 88, descriptive of their Santa Fe type locomotives. They have also prepared record No. 89, descriptive of the development of the eight-driving-wheel locomotive.

GENERATORS.—The Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., has prepared leaflet 3555-A, descriptive of its self-contained vertical shaft alternating-current generators. This company has also prepared leaflet 2000, giving information regarding its 10-kw. direct-current turbine-generator.

AUTOMOTIVE EQUIPMENT.—A special publication descriptive of starting motors, lighting generators and ignition units for automobiles, trucks, tractors, airplanes, motor boats and locomotives has just been issued by the Westinghouse Electric & Manufacturing Company of East Pittsburgh, Pa. This gives a general description of the Westinghouse starting motor for engines of piston displacement from 200 cu. in. to 1000 cu. in., and of Westinghouse generators of capacities from 15 amp. to 25 amp. at 6.5 volts to 13.0 volts. Among the latter are included the new cam-regulated generators which are being used on military and commercial trucks and on farm tractors. Generators thus regulated will give constant voltage over a wide range of speed even though the battery is disconnected from the circuit. The book is profusely illustrated with views of the apparatus and its various parts, and tables giving the necessary data for application are included.

New Incorporations

THE CLINTON (TENN.) POWER COMPANY has been incorporated with a capital stock of \$20,000 by R. A. Moser, J. W. Hill, H. D. Hicks and others.

THE MERIDIAN ELECTRIC COMPANY of Buffalo, N. Y., has been incorporated with a capital stock of \$50,000 by J. A. F. and E. M. Keppel of Ebenezer.

THE CONNOQUESSING LAWRENCE LIGHT & POWER COMPANY of New Castle, Pa., has been incorporated with a capital stock of \$10,000 to operate a local plant. E. C. Dunlap is one of the incorporators.

THE GAS ENGINE & ELECTRIC COMPANY of Charleston, S. C., has been incorporated by H. Stevens White, A. D. Wall and J. Ewing Bonneau. The company is capitalized at \$50,000 and proposes to manufacture gas engines.

THE CUTHBERT COMPANY of Dayton, Ohio, has been organized with a capital stock of \$500,000 by Charles S. Hall of the Hall Electric Company of Dayton and others. The company proposes to manufacture electrical devices.

THE STENMAN ELECTRIC VALVE GRINDING COMPANY of Worcester, Mass., has been incorporated with a capital stock of \$50,000. The officers are: B. F. Stenman, president, and Albert W. Larson, 10 Conway Street, treasurer.

THE HANAK CONVEYOR COMPANY of Houston, Tex., has been incorporated with a capital stock of \$5,000 by Edward Hanak, J. G. Belton and Robert Kornbeck. The company proposes to manufacture conveyors and trolley systems.

THE GUIDE & SIGNAL LIGHT COMPANY of Indianapolis, Ind., has been incorporated by Richard McClellan, L. Greenburg and Robert Eaglesfield. The company is capitalized at \$100,000 and proposes to manufacture electrical devices.

THE INVENTIONS BOARD, INC., of New York, N. Y., has filed articles of incorporation with a capital stock of \$5,000 for the purpose of manufacturing wiring apparatus. The incorporators are: P. D. Strogoff, O. B. and M. Wren, 5 Nassau Street, New York City.

THE UNITED ELECTRIC SUPPLY CORPORATION has filed articles of incorporation under the laws of the State of Delaware with a capital stock of \$20,000, to manufacture electrical machinery of all kinds. The incorporators are: F. M. Byrne, J. F. Byrne and H. H. Byrne.

THE UNEEDUS MERCANTILE CORPORATION of New York, N. Y., has been incorporated with a capital stock of \$30,000 by I. E. A. Konigsberg, H. J. Lucke and S. M. Bender, 2 Rector Street, New York City. The company proposes to manufacture telephone and acoustic apparatus.

THE SUN-LIGHT ARC COMPANY of New York, N. Y., has been incorporated by M. M. Eisenberg, E. M. James, 2 Rector Street, New York City, and A. C. Head, 187 Martense Street, Brooklyn, N. Y. The company is capitalized at \$300,000 and proposes to manufacture patented arc lamps.

THE EVANWOOD BATTERY CORPORATION of Buffalo, N. Y., has been chartered with a capital stock of \$500,000 by H. E. Evans, H. J. Wood, 1358 Main Street, Buffalo, N. Y., and R. H. Templeton, 428 Ashland Avenue, Buffalo. The company proposes to manufacture chemical electric batteries.

THE BOSTON INSULATED WIRE & CABLE COMPANY of Hamilton, Ont., has been chartered with a capital stock of \$200,000 to manufacture cables, wire, etc. The incorporators are: Benjamin T. Burley of Worcester, Mass.; Harry B. Burley of Brookline, Mass.; Grant W. Arnold of Hamilton and others.

NATHAN A. KRISCHER of New York, N. Y., has been incorporated by N. A. Krischer, M. Krischer, 30 West 112th Street, New York City, and J. Weinstock, 1459 Minford Place, the Bronx. The company is capitalized at \$50,000 and proposes to manufacture metal and leather goods and novelties and gas and electrical supplies.

THE MONTGOMERY TRANSIT LIGHT COMPANY of Norristown, Pa., has filed articles of incorporation under the laws of the State of Delaware to construct and operate electric railways and light plants. The company is capitalized at \$1,000,000, and it is understood that it will take over the Montgomery Transit Company, which operates a railway from Norristown to Harleysville, a distance of 11 miles.

New England States

LENEX, MASS.—Application has been made to the State Gas and Electric Commission by the Lenox Electric Company for permission to issue \$51,000 in capital stock the proceeds to be used for additions and extensions to its system.

PLYMOUTH, MASS.—The Plymouth Electric Light Company is planning to extend its electric transmission line to Livermore Falls, a distance of 2 miles, to be completed June 15, 1918. A. F. Wentworth is treasurer.

DANBURY, CONN.—The National Electric Utilities Corporation has recently closed a contract with the Navy Department at Washington for 300 electric ovens to be used on Government vessels.

NORWICH, CONN.—At a special election held recently the voters authorized an appropriation of \$200,000 for the installation of a 3000-kw. turbine and two 500-hp. boilers in the municipal electric-light plant; also an appropriation of \$25,000 to install a new water-gas unit in the municipal gas plant.

WATERBURY, CONN.—The Mattatuck Manufacturing Company is contemplating the construction of a boiler house.

Construction

News of Projects, Plans, Bids and Contracts. Notes on Work Under Way

FRANKLIN, N. J.—The installation of a new electric fire alarm system is under consideration by the Borough Council.

NEWARK, N. J.—The Board of Freeholders has awarded the contract for electric and power wiring at the County Hospital at Overbrook to the Beaver Engineering Company, 59 Mechanic Street, at \$14,174. Extensive improvements to the heating system at the institution are under consideration, to cost about \$75,000.

SKILLMAN, N. J.—Contract has been awarded by the Philadelphia & Reading Railroad Company of Philadelphia, Pa., to A. L. Carhart, of Philadelphia, Pa., for the construction of a power house and signal tower in Skillman, to cost about \$40,000.

SUCCASUNNA, N. J.—The New Jersey Power & Light Company of Dover has begun work on the installation of a new street-lighting system from Kenvil to Succasunna.

WHARTON, N. J.—The New Jersey Power & Light Company has submitted a contract (renewal) to the Borough Council for lighting the streets of the borough for a period of five years.

ASHLEY, PA.—Contract has been awarded by the Central Railroad Company, 143 Liberty Street, New York, N. Y., for the construction of an addition, 70 ft. by 70 ft., to its power plant at Ashley.

BENNINGTON, PA.—Contract has been awarded by the Pennsylvania Railroad Company for the erection of a new signal tower, 15 ft. by 25 ft., two stories, to P. W. Finn & Son, of Altoona, Pa.

HARRISBURG, PA.—The City Commission is considering the installation of a new electrically-driven pump and motor at the municipal pumping station. Improvements to the electric fire-alarm system are also under consideration.

KUTZTOWN, PA.—At an election held recently the proposal to appropriate \$15,000 to complete the municipal electric-lighting plant was carried.

NEW BLOOMFIELD, PA.—Plans are being considered by the New Bloomfield Hosiery Mills for equipping its plants for electrical operation, to replace steam power.

PHILADELPHIA, PA.—The Colver Electric Company has filed notice with the Public Service Electric Company of an issue of \$25,000 in capital stock, the proceeds to be used for improvements, etc.

PHILADELPHIA, PA.—The Tioga Steel & Iron Company, Fifty-second Street and Gray's Ferry Avenue, has awarded contract for the erection of an addition to its power house, to cost about \$8,000, to Crowell, Lunderd & Little Company of Philadelphia.

PHILADELPHIA, PA.—Bids will be received by William S. Twining, director department of city transit, City Hall, Philadelphia, Pa., until Feb. 14 for electrical installations in station buildings at Torresdale Avenue and Tioga Street, under contract No. 512. Plans and specifications can be seen at Room 748, Bourse Building, and copies obtained, with blanks for proposals, upon deposit of \$10, which will be refunded upon return of plans.

READING, PA.—Notice has been filed by the Metropolitan Edison Company with the Public Service Commission of an issue of \$97,500 in bonds, the proceeds to be used for improvements, extensions, etc.

FAIRMONT, W. VA.—George W. F. Mulliss of Martinsburg, agent of the Intervoven Mills at Fairmont, would like to receive estimates on electrical equipment for installation at Fairmont.

TIMBERVILLE, VA.—The local electric-light plant, owned by the estate of the late Charles E. Fahrney, has been purchased by Hoover Brothers.

WASHINGTON, D. C.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until Feb. 18, under specification (No. 2760) for mechanical equipment for power plants at Norfolk and Philadelphia navy yards.

WASHINGTON, D. C.—Bids will be received at the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., for furnishing at the various navy yards and naval stations supplies as follows: Brooklyn, N. Y., Schedule 1671—miscellaneous leaded and armored interior communication cable, 145,000 ft. plain single-conductor wire; Schedule 1670—630,000 ft. incandescent lamp cord, 115,000 ft. rubber-insulated, lead-covered wire, miscellaneous duplex, single-conductor, rubber-covered wire, 120,000 ft. rubber-insulated telephone wire, 130,000 ft. twin-conductor wire. Schedule 1669—miscellaneous 12-in. desk and bracket fans. Application for proposal blanks should give the schedule desired by number.

North Central States

GRAND RAPIDS, MICH.—Preparations are being made by the City Council for the construction of a 300,000-gal. concrete reservoir for which bids will be advertised for next month. F. H. Leonard is superintendent of the light and water plant.

LOWELL, MICH.—The town of Lowell expects to take over the water-works system March 1. T. J. McMahon is superintendent of the municipal electric-light plant.

MUNISING, MICH.—The Electric Light & Power Company of Munising contemplates running a submarine cable to Grand Island, a distance of 1 mile, from the end of its service line. James Hosking is vice-president and manager.

MELBOURNE, KY.—Contracts have been awarded by the Sisters of Providence for the electric wiring of the administration building and mother house to Tisber Brothers of Covington. The cost of the building is estimated at \$200,000.

DECATUR, IND.—Contracts have been placed for one 500-kw. General Electric turbo-generator, with barometric jet condenser, to be installed in the municipal electric-light plant in the spring. R. G. Christin is clerk.

INDIANAPOLIS, IND.—The capital stock of the Standard Machine & Electric Company has been increased from \$75,000 to \$100,000.

MARION, IND.—The Delta Electric Company has increased its capital stock from \$90,000 to \$115,000.

MARION, IND.—The Indiana Public Service Commission has authorized the Indiana General Service Company, controlled by interests represented by R. E. Breed, of New York, N. Y., to purchase the properties of the Marion (Ind.) Light & Heating Company and the Muncie (Ind.) Electric Light Company.

BONDVILLE, ILL.—The Bondville Electric Light Company is considering the installation of power service for one or two elevators, which would require 20 hp. in motors each. The company would like to receive information and prices on equipment for same. Jay C. Flowers is secretary.

HOMER, ILL.—The Homer Electric Light & Power Company, recently taken over by J. M. Capel and others of Champagne, has been reorganized under the name of the Homer Electric Light Company. The new company is capitalized at \$30,000.

SOUTH BEND, ILL.—The building occupied by the Indiana & Michigan Electric Company was recently destroyed by fire, causing a loss of about \$120,000.

SWANSEA, ILL.—The municipal electric-light plant was recently destroyed by an explosion causing a loss of about \$15,000. Post office address, Belleville, Ill.

WOODLAWN, ILL.—The Southern Illinois Light & Power Company of Hillsboro has applied to the Public Utilities Commission for a certificate of convenience and necessity to operate an electric light and power plant at Woodlawn.

BLOOMER, WIS.—The City Council is considering the question of establishing a municipal electric-light and power plant.

DE SOTO, WIS.—The village of De Soto is considering the construction of a municipal electric-light plant.

HARTFORD, WIS.—Bids will be received by A. Martin, city engineer, until Feb. 19 for a deep-well pump and a two-phase, 60-cycle alternating-current motor, switchboard and temporary connections with water mains.

LAKE GENEVA, WIS.—Bids will be received until Feb. 4 for the erection of an electric line on Clover and Pleasant Streets west of Conant Street to the city limits.

SHAWANO, WIS.—Plans are being considered by the Shawano Lumber Company for the construction of a new lumber mill, to be equipped throughout for electrical operation, to cost about \$30,000.

STOUGHTON, WIS.—The Porter Electric Line Company, recently incorporated, it is reported, will erect an electric transmission line to connect with the Stebbinsville-Stoughton conduit system. The proposed line will be about 10½ miles long, and will extend from Dunkirk to the Cooksville-Edgerton Road, and from there to Cooksville, and thence to Tolles Corner.

Middle Atlantic States

ALBANY, N. Y.—Bids will be received at the office of W. W. Wotherspoon, superintendent of public works, Capitol, Albany, until Feb. 5 for barge canal work, including construction of additional protection work in by-passes at lock and barge canal terminal, furnishing fourteen 2-ton steam tractor cranes, building freight house and four electrically operated timber derricks.

BROOKLYN, N. Y.—Contracts have been awarded for the construction of a new power plant, 55 ft. by 105 ft., at the Brooklyn Naval Hospital.

BUFFALO, N. Y.—The City Council has approved a bond issue of \$60,000 for the purpose of placing the wires of the police and fire departments underground.

GROTON, N. Y.—The Groton Electric Power Corporation, which has leased the municipal electric-light plant, is installing a 250-hp. Erie boiler. W. E. Yates is engineer of the power station.

NEW YORK, N. Y.—The J. F. & M. B. Construction Company is considering the construction of a new power house at 1562 Odell Street, the Bronx, in the near future.

NEW YORK, N. Y.—Plans have been filed by the New York Edison Company, 130 East Fifteenth Street, for the construction of a new transformer station at Park Avenue, near 139th Street, to cost about \$15,000. Contract has been awarded to the Louis Weber Building Company, 171 Madison Avenue, New York City.

NEW YORK, N. Y.—Bids will be received at the Bureau of Yards and Docks, Navy Department, Washington, D. C., until Feb. 11, for piping and accessories, turbine-driven centrifugal pump, structural steel foundations and miscellaneous work in connection with the installation of new equipment in the central power plant at the navy yard, New York. Drawings and specifications (No. 2794) may be obtained on application to the above bureau or to the commandant of the navy yard named.

NIAGARA FALLS, N. Y.—Plans have been filed by the Oldbury Electric Chemical Company, Buffalo Avenue, Niagara Falls, for the erection of a new reinforced concrete addition to power house. The building will be about 35 ft. by 65 ft., and will cost about \$15,000. Contract has been awarded to G. W. Moyer & Son, 633 Tenth Street, Niagara Falls.

OXFORD, N. Y.—Bids will be received by Mrs. Georgiana Griffith, president of board of managers, of the New York Woman's Relief Corps Home, Griffith, until Feb. 13 for refrigeration plant. Drawings, specifications and blank form of proposals may be consulted and copies obtained at the Department of Architecture, Albany, the New York City office of the Department of Architecture, Woolworth Building, or at the home, Oxford, N. Y.

CAMDEN, N. J.—Plans have been filed and contract awarded to the Holbrook Cabot Rollins Company of Camden by the New York Shipbuilding Company for the construction of a new power house, 45 ft. by 95 ft., at its works at Broadway and Fairview Street.

DOVER, N. J.—The New Jersey Power & Light Company has entered into a contract with the International High Speed Steel Company for furnishing electricity for motors, lamps and electric furnaces at the plant of the steel company.

WEST ALLIS, WIS.—The Board of Education it is understood, will soon ask for bids for the construction and equipment of a high school and manual training institute. The building will be 176 ft. by 277 ft., three stories and basement, with a separate boiler house, to cost about \$200,000.

BROOKTON, MINN.—The installation of a 2½-hp. oil engine and a 1-kw. generator to take the place of the present storage battery in the municipal electric-light plant is under consideration by the Town Council. F. W. Sonnenberg is superintendent.

GLYDON, MINN.—Arrangements are being made by the Glydon Light Company for the installation of additional street lamps. H. C. Royle is secretary.

HIBBING, MINN.—The city of Hibbing is contemplating the construction of a new municipal electric plant, to cost about \$500,000. G. L. Thaum is secretary of water and light commission.

MILAN, MINN.—The Milan Light & Power Company contemplates the installation of a complete new storage battery in the spring. Messrs. Haughland & Kanten are owners.

PINE RIVER, MINN.—The Pine River Electric Light & Power Company expects to install a steam plant in the near future. Upon completion of the proposed new plant a 23-hour service will be established. T. L. Arvig is secretary and superintendent.

PIPESTONE, MINN.—Laundry, power plant and pumping system at the Pipestone Indian Training School were recently destroyed by fire, causing a loss of about \$25,000.

AMES, IOWA.—A new 600-kw. General Electric 2200-volt, three-phase, 60-cycle turbine is being installed in the municipal electric-light and water plant. A. F. Hill is manager.

INDEPENDENCE, IOWA.—Plans are being considered for an addition to power house at the State Hospital for Insane, for which, it is reported, bids will be asked in the spring. New equipment, including one generator and two boilers, will be installed. H. T. Liebke, State House, Des Moines, is architect.

PERRY, IOWA.—Bids will be received by the city of Perry until Feb. 15 for one 60-kva., two-phase, 60-cycle, 220-volt generator, directly connected to engine, to be installed at the municipal waterworks. Specifications may be obtained at the office of the city clerk. Adrian Cross is city clerk.

WATERLOO, IOWA.—Application has been made to the Board of Railroad Commissioners by the Citizens' Gas & Electric Company of Waterloo for a franchise to erect electric transmission lines to adjoining counties and towns.

BUCKLIN, MO.—The property of the Bucklin Light & Power Company has been purchased by H. A. Spradling, of Marcelline.

KAHOKA, MO.—Plans are being considered to extend the electric transmission lines of the municipal electric-light plant to Luray, Williamstown, Clark City and Medill in the spring. L. R. Sherrill is superintendent.

OREGON, MO.—The city of Oregon is planning to secure electricity from St. Joseph to operate the municipal electric-system and will erect a transmission line at once.

FULLERTON, N. D.—The Ellendale (N. D.) Electric Company has been granted a franchise to erect electric transmission lines from its Ellendale plant to Fullerton and Monango. G. F. Phillips is treasurer and manager of the company.

NOME, N. D.—The City Council is considering the installation of an electric-lighting system.

AINSWORTH, NEB.—The Ainsworth Light & Power Company has secured a contract to supply electricity in Bassett, and will erect an electric transmission line to Long Pine, where it will connect with the line to be built by the Bassett Distributing Company. W. V. Finney is manager.

ARLINGTON, NEB.—The Arlington Light, Heat & Power Company is contemplating the installation of a kerosene engine and changing its system from single phase, 125 cycles, to three phase, 60 cycles, 2200/110-220 volts. M. E. Winset is manager.

BENKELMAN, NEB.—The Council is considering the purchase of a 12-kw. generating unit (for engine service) soon for the municipal electric-light plant. J. R. Hardisty is manager.

BROADWATER, NEB.—The Broadwater Electric Light & Power Company is planning to install a new generating unit, consisting of a 50-hp. oil engine and a 35-kw., 125-volt direct-current generator. T. F. Black is engineer.

ERNST, NEB.—The Meyer Hydro Electric Power Company is considering extending its electric transmission lines to Nelson, Ong, Shickley and Tetyahere. Ernst Meyer is president and manager.

LONG PINE, NEB.—S. H. Kyner, owner of the local electric-light and power plant, is considering the installation of a 100-kw. generator, switchboard and one 20-hp. motor at his power plant; also two pumps and constructing about 4000 ft. of water main from city main to plant.

PIERCE, NEB.—The Pierce Milling Company is rebuilding its power house and installing an additional 50-kva. generator, to be driven by water power and a new 250-hp. Corliss steam engine. Frank E. Drebert is manager.

RED CLOUD, NEB.—The city of Red Cloud has rebuilt part of its pole line system to Riverton and Inavale, and is now erecting a single-phase transmission line to Incz. C. Z. Woodworth is superintendent.

SCHUYLER, NEB.—Plans are being considered by the City Council to rebuild the municipal electric-light plant. It is proposed to replace the present direct-current apparatus with an alternating-current equipment. E. A. Schmid is manager.

SIDNEY, NEB.—Improvements are contemplated to the municipal electric-light plant during 1918, including the installation of a 200-hp. boiler and a 150-kva. generator and engine. J. E. Poquette is manager.

STRATTON, NEB.—Improvements to the municipal electric-lighting system in the near future, including the installation of a 20-hp. semi-Diesel engine and a 10-kw. generator, are under consideration. Elmer Martin is engineer.

ARCADIA, KAN.—An electric transmission line will be erected from Arcadia to Oskaloosa to supply electricity to operate the local system, owned by Phillip K. Tohl.

CHARDON, KAN.—At an election held recently the proposal to issue \$25,000 in bonds for the installation of a new electric-light plant was carried.

COLBY, KAN.—Bonds to the amount of \$30,000 have been voted for improvements to the municipal electric-light plant.

GARFIELD, KAN.—The Kinsley Electric Light & Power Company has secured a contract to supply electricity in Garfield. An item published in the issue of January stated that local business men had entered into a contract for electricity from the municipal electric plant in Larned. A. L. Moe is owner and manager of the Kinsley Electric Light & Power Company.

HUGOTON, KAN.—The Liberal (Kan.) Light & Power Company is contemplating extending its electric transmission line to Hugoton to furnish electrical service here.

Southern States

CARROLLTON, GA.—Plans are being considered to double the output of the yarn mill of the Mandeville Mills. Four frame type motors having total capacity of 450 hp. will be purchased.

SAVANNAH, GA.—Bids will be received at the office of the supervising architect, Treasury Department, Washington, D. C., until Feb. 15 for furniture, lighting and repairs to conduit and wiring in the United States post office at Savannah. Drawings and specifications may be obtained at the above office.

MIAMI, FLA.—The Miami Traction Company is considering the construction of an electric railway between Miami and Miami Beach.

CHATTANOOGA, TENN.—The Tennessee Power Company, it is reported, contemplates additional hydroelectric developments and erection of transmission line extensions to prepare for supplying electricity to the explosive manufacturing plant the government will build at Hadley's Bend.

CLINTON, MISS.—Preparations are being made by the Town Council to install an oil-burning outfit in the municipal electric-light plant, but as yet it has been unable to secure an engine. M. Latimer is mayor.

HOMER, LA.—Preparations are being made to drill another well to double the output of the water supply of the municipal water-works system. W. A. McKinzie is superintendent of the municipal water and light plant.

BRISTOW, OKLA.—The City Council has decided to call an election to submit the proposal to issue \$36,000 in bonds for the purchase of the local electric-light and power plant to be owned and operated by the municipality.

CANYON, TEX.—The plant of the Canyon Power Company was recently damaged by fire.

DALLAS, TEX.—The Dallas Light & Power Company is contemplating erecting an electric transmission line from its local plant to Norwood.

HOUSTON, TEX.—The Houston & Texas Railway Company is contemplating the construction of an interlocking signal tower, 24 ft. high, at a cost of about \$16,000. I. A. Collingham is engineer.

Pacific and Mountain States

ELLENSBURG, WASH.—Application has been made to the Board of County Commissioners by Henry C. Mills for a franchise to erect and operate electric transmission lines on highways throughout the county for a period of 50 years.

SEATTLE, WASH.—Plans have been completed for the erection of a boiler shop, 180 ft. by 263 ft., for the Puget Sound machinery depot, to cost about \$75,000.

SEATTLE, WASH.—Bids will be received by the Board of Public Works, Seattle, until March 1 for construction of the proposed hydroelectric power plant to cost \$5,000,000. Bids may be submitted by either owners of sites or contractors in conjunction with owners of sites. It is probable that bids will be submitted on construction of a plant on the site to which the city of Seattle has just secured from the Government full rights on the Skagit River.

SPOKANE, WASH.—The erection of a charging plant for rebuilding electrical machinery and charging storage batteries is under consideration by the Chase Engineering Company.

PENDLETON, ORE.—Improvements are contemplated by the Pendleton Kolier Mills involving an expenditure of about \$10,000, and will include the installation of dump scales, conveyor belts and other improvements.

SAN FRANCISCO, CAL.—Work has begun on the construction of the shipbuilding plant of the Pacific Coast Shipbuilding Company at Bay Point. The buildings will include a plate shed, 80 ft. by 400 ft., two stories; machine shop, 120 ft. by 400 ft., one story, a large warehouse, power house, an office building, planing mill, etc. The launching ways will be 500 ft. long, 53 ft. wide, with 95 ft. clearance between. Aerial trolleys will be used for the transportation of supplies. The cost of the plant is estimated at \$500,000.

KINGMAN, ARIZ.—The Desert Power & Light Company is planning to extend its electric transmission lines to Hackberry and to Cyclopic.

BRIDGER, MONT.—The Bridger Water & Light Company contemplates changing its system from direct to alternating current, provided equipment can be secured. J. S. Emmett is secretary and treasurer.

Canada

BANFF, ALTA.—The Alberta Electro-Chemical Company is contemplating the installation of machinery at its plant at Kananaski Falls, Alberta, for the manufacture of carbide, etc. Dr. Harry Brett of Banff is in charge.

PRINCE RUPERT, B. C.—The Prince Rupert Hydro-Electric Company has submitted a proposal to the City Council offering to sell the Falls River plant, including improvements, to the city of Prince Rupert for \$34,000.

SYDNEY, N. S.—The Cross Fertilizer Company, Prince Street, it is reported, will rebuild its mill and engine room, recently destroyed by fire, at once. The cost is estimated at \$20,000.

Miscellaneous

PANAMA.—Bids will be received at the office of the general purchasing officer, the Panama Canal, Washington, D. C., until Feb. 11 for furnishing soft steel, structural steel, plate steel, 100 ft. black pipe, trans-formers, 15,000 ft. cable, copper wire, 300 ft. conduit, 645 fixtures, one electric range, 600 reflectors, 75 resistance units, one fee pump, three hoist blocks, etc.

PANAMA.—Bids will be received at office of the general purchasing officer, the Panama Canal, Washington, D. C., until Feb. 6 for furnishing mill work for ordnance shop, two annunciators, 19 porcelain blocks, brass junction boxes, 50 vibrators, bells, 100 push buttons, 50 buzzers, tinne copper cable, 25 fans, 150 glass tube fuses, miscellaneous electric fixtures, 150 marine globes, electrical supplies, receptacles, sleeves, stuffing tubes, terminal boxes, conduit tubes, desk tubes, etc.

ALABAMA LIGHT AND TRACTION ASSOCIATION. Secretary-treasurer, J. P. Ross, Birmingham Railway, Light & Power Co.

AMERICAN ASSOCIATION OF ENGINEERS. Secretary, A. H. Krom, 29 South La Salle St., Chicago. Annual meeting, May 14, 1918.

AMERICAN ELECTRIC RAILWAY ASSOCIATION. Secretary, E. B. Burritt, 8 West 40th St., New York.

AMERICAN ELECTROCHEMICAL SOCIETY. Secretary, Prof. J. W. Richards, Lehigh University, South Bethlehem, Pa.

AMERICAN INSTITUTE OF CONSULTING ENGINEERS, Inc. Secretary, F. A. Molitor, 35 Nassau St., New York City.

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS. Secretary, F. L. Hutchinson, 33 West 39th St., New York. Board of directors meets monthly. Sections and branches in the principal electrical centers throughout the country.

AMERICAN PHYSICAL SOCIETY. Secretary, Prof. A. D. Cole, Ohio State University, Columbus, Ohio.

AMERICAN SOCIETY FOR TESTING MATERIALS. Secretary-treasurer, Edgar Marburg, University of Pennsylvania, Philadelphia.

ARKANSAS ASSOCIATION OF PUBLIC UTILITY OPERATORS. Secretary-treasurer, Roy B. Fowles, Pine Bluff, Ark.

ASSOCIATED MANUFACTURERS OF ELECTRICAL SUPPLIES. General secretary, C. E. Dustin, 30 East 42d St., New York.

ASSOCIATION OF EDISON ILLUMINATING COMPANIES. Secretary, George C. Holberton, San Francisco, Cal.

ASSOCIATION OF IRON AND STEEL ELECTRICAL ENGINEERS. Secretary, John F. Kelly, McKeesport, Pa. Annual convention, September, 1918.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS. Secretary-treasurer, Joseph A. Andreucetti, Chicago & Northwestern Railway, Chicago.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS. Secretary, W. L. Connelly, Gibson, Ind.

BRITISH COLUMBIA ASSOCIATION OF ELECTRICAL CONTRACTORS AND DEALERS. Secretary, R. B. W. Pirie, 406 Yorkshire Building, Vancouver, B. C. Annual meeting, September, 1918.

CALIFORNIA ASSOCIATION OF CONTRACTORS AND DEALERS. Secretary, James W. Redpath, 505 Rialto Bldg., San Francisco, Cal.

CANADIAN ELECTRICAL ASSOCIATION, affiliated with N. E. L. A. Secretary-treasurer, M. C. Gilman, Toronto Electric Light Company.

COLORADO ELECTRIC LIGHT, POWER AND RAILWAY ASSOCIATION. Secretary-treasurer, F. F. Kennedy, 900 15th St., Denver, Col.

COMMERCIAL SECTION N. E. L. A. Secretary, F. D. Beardslee, Union Electric Light & Power Co., St. Louis, Mo.

CONNECTICUT ELECTRICAL CONTRACTORS AND DEALERS' ASSOCIATION. Secretary, George M. Chapman, Waterbury, Conn. Annual meeting, New Haven, Conn., May, 1918.

EASTERN NEW YORK SECTION, N. E. L. A. Assistant secretary, J. L. Hemphill, General Electric Co., Schenectady, N. Y.

ELECTRICAL MANUFACTURERS' CLUB. Secretary, Shiras Morris, Hart & Hegeman, Hartford, Conn.

ELECTRICAL SUPPLY JOBBERS' ASSOCIATION. General secretary, Franklin Overbagh, 411 South Clinton St., Chicago, Ill.

ELECTRICAL TRADES ASSOCIATION OF CANADA. Secretary, William R. Stavelly, Royal Insurance Building, Montreal, Can.

ELECTRICAL CREDIT ASSOCIATION OF THE PACIFIC COAST. Secretary, Albert E. Elliott, 502 Flatiron Building, San Francisco.

ELECTRIC POWER CLUB. Secretary, C. H. Roth, 1410 West Adams St., Chicago.

ELECTRIC VEHICLE SECTION OF THE N. E. L. A. Secretary, A. Jackson Marshall, 29 West 39th St., New York.

EMPIRE STATE GAS AND ELECTRIC ASSOCIATION. Secretary, Charles H. B. Chapin, 29 West 39th St., New York.

FLORIDA ENGINEERING SOCIETY. Secretary, R. Benton, Gainesville, Fla.

GAS, ELECTRIC AND STREET RAILWAY ASSOCIATION OF OKLAHOMA. Secretary-treasurer, L. W. Morrow, Norman, Okla. Annual meeting, May, 1918, Oklahoma City.

GEORGIA ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, Dan Carey, Atlanta Builders' Exchange, Atlanta, Ga. Annual meeting, June, 1918, Tybee Island, Ga.

ILLINOIS ELECTRICAL CONTRACTORS' ASSOCIATION. Secretary, L. B. Van Nuys, Central Electric Co., Peoria, Ill.

ILLINOIS STATE ELECTRIC ASSOCIATION. Secretary, R. H. Abbott, Petersburg, Ill.

ILLUMINATING ENGINEERING SOCIETY. General secretary, Clarence L. Law. Sections

(Issued Jan. 1, 1918.)

1,251,818. ELECTRICALLY OPERATED SWITCH. Theodore Varney and Howard L. Beach, Pittsburgh, Pa. App. filed June 28, 1911. Necessity for heavy and expensive switch-board panels is avoided.

1,251,856. ELECTRIC SWITCH; Carl Barr, Chicago, Ill. App. filed March 26, 1917. Improved clip for co-operation with the knife of an ordinary knife switch in order to complete or break an electric circuit.

1,251,867. AUTOMATIC CARriage RETURN FOR TYPEWRITERS, LINE SPACERS AND RE-

1,251,572—Electrical Protective Apparatus—

VERSE TABULATORS; Thomas F. Crawley, Newton, Mass. App. filed Oct. 16, 1915. Improvements.

1,251,940. AUTOMOBILE SIGNAL; James J. Ulich, Des Moines, Iowa. App. filed July 13, 1916. Electrically operated.

1,251,967. CALL-ANSWERING METER FOR CORD CIRCUITS; Hiram D. Currier, Chicago, Ill. App. filed Sept. 19, 1914. Improved apparatus for actuating such a meter.

1,251,982. MULTIPLE-PHASE-MOTOR REGULATING RESISTANCE; Fredrik Ljungstrom, Finspong, Sweden. App. filed April 16, 1915. Resistances in which two conoidal or more or less funnel-form conducting parts and intervening fluid are employed to make the resistance.

1,251,983. CONNECTION FOR ELECTRIC CONDUCTORS; James H. Lockwood, Bridgeport, Conn. App. filed Jan. 29, 1917. Improvement.

1,251,985. AUTOMATIC SWITCH; Frank A. Lundquist, Chicago, Ill. App. filed Feb. 12, 1917. Improvements.

1,251,988. AUTOMATIC SELECTIVE SWITCH; James L. McQuarrie, Montclair, N. J. App. filed Nov. 15, 1916. Controlling means.

1,251,991. ELECTRIC-CORD PROTECTOR; Claude R. Dodge, Salt Lake City, Utah. App. filed Nov. 2, 1916. Will also serve as a shock-absorbing means.

1,252,028. TELEPHONE-EXCHANGE SYSTEM; Osvald E. Rasmussen, West Hoboken, N. J. App. filed Nov. 17, 1916. Improvements in automatic numerical switches used in automatic and semi-automatic telephone-exchange systems.

1,252,052. LOCOMOTIVE; Norman W. Storer, Pittsburgh, Pa. App. filed Aug. 10, 1915. Quill drive.

1,252,056. TELEPHONE RECEIVER; Naho Tannaka, Boston, Mass. App. filed Dec. 19, 1916. Improvements.

1,252,057. TELEPHONE TRANSMITTER; Naho Tannaka, Boston, Mass. App. filed Feb. 14, 1917. Improvements.

1,252,060. ELECTRICAL REGULATOR; Allen A. Tirrill, Pittsburgh, Pa. App. filed Oct. 5, 1911. Regulation is effected by adjustment of the field excitation of a dynamo-electric machine.

1,252,067. HOLDER FOR LIGHT-TRANSMITTING BOWLS AND REFLECTORS; Edwin L. White, Brooklyn, N. Y. App. filed June 13, 1917. Semi-indirect lighting effect.

1,252,110. THEFT DETECTOR FOR AUTOMOBILES AND OTHER VEHICLES; John H. Hills and Joseph M. Mason, Philadelphia, Pa. App. filed Jan. 9, 1917. Improvements.

1,252,141. ELECTRIC FUSE; Thomas E. Murray, New York, N. Y. App. filed Dec. 23, 1916. Tubular fuse case formed of struck-up sheet metal.

1,252,142. METHOD OF ELECTRICAL WELDING; Thomas E. Murray, New York, N. Y. App. filed Jan. 10, 1917. Improvements.

1,252,143. ELECTRIC WELDING MACHINE; Thomas E. Murray and Harry R. Wood-

Record of Electrical Patents

Notes on United States Patents

row, New York, N. Y. App. filed Feb. 19, 1917. Welds in succession a plurality of joints between the bodies to be united.

1,252,144. PROCESS OF AND APPARATUS FOR WELDING METAL BODIES AND FOR ANNEALING SAID BODIES AT THE WELDED JOINT; Thomas E. Murray, Jr., and Joseph B. Murray, Brooklyn, N. Y. App. filed April 24, 1917. Improvements.

1,252,145. APPARATUS FOR ELECTRICAL WELDING; Thomas E. Murray, Jr., Brooklyn, N. Y. App. filed May 5, 1917. An apparatus for electrical welding, comprising an electrode having an opening constructed to receive and fit upon one of the bodies to be welded and an electrode connected to the other of said bodies, the first-named electrode being of a material having greater electrical conductivity than said received body.

1,252,146. METHOD OF AND APPARATUS FOR ELECTRICALLY WELDING PLATES OR BARS TOGETHER; Thomas E. Murray, Jr., Brooklyn, N. Y. App. filed July 13, 1917. Improvements.

1,252,147. METHOD OF ELECTRICALLY MAKING OPENINGS OF DESIRED CONFIGURATION IN METAL PLATES; Thomas E. Murray, Jr., Brooklyn, N. Y. App. filed Oct. 10, 1917. Improvements.

1,252,148. METHOD OF AND APPARATUS FOR ELECTRICALLY DIVIDING METAL PLATES; Thomas E. Murray, Jr., Brooklyn, N. Y. App. filed Oct. 10, 1917. Improvements.

1,252,185. DIAGRAM FOR ELECTROLYTICAL AND ELECTRO-OSMOTICAL PURPOSES; Botho Schwerin, Frankfurt-on-the-Main, Germany. App. filed Jan. 4, 1913. Improvements.

1,252,196. COMBINED FIRE AND BURGLAR ALARM; Arthur A. Taylor and Henry J. Schatz, Omaha, Neb. App. filed March 2, 1917. Improvements.

1,252,201. ELECTRIC METER; Elihu Tomson, Swampscott, Mass. App. filed Oct. 10, 1914. Direct current.

1,252,203. RHEOSTAT; William F. Valcke, Jr., Chicago, Ill. App. filed Oct. 30, 1916. For regulating the amount of current which is supplied to a lamp or other apparatus connected to the socket.

1,252,216. TELEPHONE TOLL SET; Clarence A. Anderson, Abilene, Kan. App. filed April 30, 1917. For small stations.

1,252,219. BRIDGING DEVICE FOR FUSE RECEPTACLES; Clarence A. Bates, Bridgeport, Conn. App. filed Jan. 21, 1916. Improved.

1,252,288. SIGNAL; Charles W. Monahan, Pittsburgh, Pa. App. filed Jan. 31, 1917. For trains.

1,252,289. METHOD OF PRODUCING INTEGRAL PROJECTIONS ON METAL PLATES; Thomas E. Murray, Jr., Brooklyn, N. Y. App. filed Oct. 4, 1917. Improvements.

1,252,290. METHOD OF LOCALIZING AND ELIMINATING IMPERFECTIONS IN ELECTRICALLY WELDED JOINTS; Thomas E. Murray, New York, N. Y. App. filed Nov. 1, 1917. For eliminating imperfections due to make and break of the welding current.

1,252,312. ELECTROMAGNETIC ACTUATOR; Henry E. Warren, Ashland, Mass. App. filed March 7, 1913. For valves, circuit breakers, etc.

1,252,314. METAL CONDUIT FOR ELECTRIC WIRES; Chauncey W. Abbott, Pittsburgh, Pa. App. filed Aug. 18, 1915. For application to a wall, ceiling or other exposed supporting surface.

1,252,317. SEWING-MACHINE MOTOR; Chester H. Beach, Racine, Wis. App. filed June 21, 1915. Improvements.

1,252,330. AUTOMATIC TRAIN STOP; Adiel Y. Dodge, Chicago, Ill. App. filed Jan. 28, 1914. Capable of causing the brakes to be applied gradually, and such that it may be used also in connection with throttle-closing apparatus.

1,252,353. INSULATING SUPPORT; Horace P. Liversidge, Philadelphia, Pa. App. filed March 9, 1917. Novel manner of fastening the base supports and metal tops to insulators.

1,252,372. INCANDESCENT LAMP; William A. Duffah, Mansfield, Ohio. App. filed July 31, 1914. Increases the efficiency of incandescent lamps by reducing the loss of heat by the continuous passage of a relatively hot filament or the radiating element of the lamp.

(Issued Jan. 8, 1918.)

1,252,393. THERMOSTATIC CIRCUIT CONTROLLER; Charles R. Burlew, Yonkers, N. Y. App. filed March 22, 1915. Wheel-like construction is preferably provided.

1,252,399. TELEPHONE EXCHANGE; Henry P. Clausen, Mount Vernon, N. Y. App. filed April 12, 1917. In which a plurality of subscribers' stations are connected to the same line circuit.

1,252,403. ELECTRIC FIXTURE; David Conlan, Jr., New York, N. Y. App. filed Nov. 8, 1915. Does away with the necessity for splicing and soldered joints now employed in making connections at outlet boxes between main and branch conductors.

1,252,413. PROTECTIVE DEVICE FOR ELECTRIC CIRCUITS; Lewis E. Dickinson, Boonton, N. J. App. filed Nov. 6, 1916. Hea coils.

1,252,417. ELECTRIC SWITCH; Evald C. Engelke, Cleveland, Ohio. App. filed March 21, 1917. Improvements.

Number 6

Electricity a Factor in Increasing Coal Production

COAL shortage has not been without its redeeming feature so far as the electrical industry is concerned. In the anthracite region, especially where labor shortage is a handicap, operators have turned to machinery to increase production, and it is of interest to note that no other class of material has been in so great demand as electrical equipment. Had manufacturers been able to make deliveries, 1917 would have been a banner year. Shovels, hoists, drives, haulage systems, pumps, blowers and other machinery are being equipped more than ever with electric motors. The cry is for electric power, and central stations throughout the coal regions are now not hunting for markets but for equipment to keep up with load requirements. Electricity has maintained its reputation; production has been increased despite 5 per cent labor shortage, and, more than that, low costs can now be mined profitably.

Central Stations Should Take Nothing for Granted

HOUSING of the army of workers necessary at shipyards and other places engaged in war work is one of the serious problems confronting the government. In the model communities already erected all the homes have been equipped with electricity, not because of any special urging by the electrical industry but because the designers feel that electricity is the proper thing. Some day, however, the gas companies may show enterprise and these new communities and cities may be won over to the use of gas for illuminating, heating and cooking purposes. It is not wise, therefore, for the central-station industry to take anything for granted. The tortoise has been known to outrun the hare.

Constructive Criticism Needed on Water-Power Bills

WITHIN a very short time hearings will be held on water-power bills now before Congress. It is not expected that any new light will be thrown on the general proposition, for there is no subject before Congress that has been more talked of, at and for during the last decade. The need is recognized by all, and the opportunity for the passage of a constructive measure was never more favorable. But if a deadlock between the Senate and House is to be avoided—consummation devoutly to be wished—factional differences must in large measure be put aside. The so-called "administration" bill admittedly offers a simple

solution of the water-power legislation problem and is an improvement over other measures. It seeks to protect the rights of the public and at the same time to offer private capital adequate security for its investment. In short, it is 90 per cent good and the other 10 per cent is not irremediably bad. If, therefore, constructive criticism be offered on the minor defects of the measure, due allowance being made for honest and irreconcilable differences, a satisfactory compromise on these detail features may be effected and the necessary legislation finally enacted. To defer action longer on our water powers would in itself be criminal, and to damn the "administration" measure because of any slight imperfections, and thereby wreck all hope of a reasonably fair bill, would be more so.

Concrete Poles in Power Distribution

THE use of reinforced concrete for electric line poles is not new, but the example which we describe this week is in several respects somewhat out of the ordinary. The case in which poles were required was for a private distribution line to seven pumping plants in California. The transmission to be accomplished was at 22,000 volts and the aggregate power demanded 2800 hp. In this case the permanency of the installation, with perhaps somewhat greater security against line trouble, was the deciding factor in the choice of reinforced concrete. The poles were designed as square, tapered beams, reinforced symmetrically on two sides. For economy of material two sizes of poles were designed, the heavier ones to be used at each substation and for every fifth pole on the line as well as at crossings. The lighter poles served for the remainder of the work. The spacing adopted varied from 250 ft. to 390 ft. (76.2 m. to 118.9 m.).

A striking feature of the construction is that the cross-arms were molded with the poles and the whole work of molding was done on the ground on account of the great weight of the finished pole, averaging about 4 tons. The forms were laid out horizontally, reinforcement was suspended in place, and the concrete was hand-mixed and molded into them. In the cross-arms the reinforcing is of steel angle irons, which carry the insulator pins directly so that even were the concrete to be broken from the arms the stability of the conducting system would not be disturbed. After completion the poles were erected by a double derrick mounted on a derrick. The derrick was put in position, the pole caught just above its center of gravity by a chain sling, and the pole lifted on end and dropped into its hole. The average cost per pole erected was a little

less than \$70, divided with fair equality between material and labor. The poles were designed with a high factor of safety, in fact so as to withstand a 90-mile (144.8-km.) wind with all the wires on one side broken, a condition thought considerably more severe than is likely to be actually encountered in the operation of the system. It is safe to say that so far as the strength and stability of the poles go that particular line will be immune from trouble due to wind and weather for a long time to come.

A Step Toward Synchronous Operation

OPERATING engineers will be interested in a brief account we publish this week of the line-synchronizing stations of the Central Illinois Public Service Company. Two such stations have recently been erected to facilitate the interconnection of two branches of the great system, each comprising about 250 miles (402 km.) of 33,000-volt network. Previous to this installation the lines did not generally operate in parallel, and when it became necessary to do so synchronizing at one of the distant stations involved some time and annoyance. Just why these two networks have not regularly been tied in in parallel it is a little hard to see, but there are many such cases of neglected opportunity, and it is altogether pleasant to see the obvious step toward unified distribution being so effectively taken, especially at this time when every effort is being made to conserve fuel, labor, capital and equipment and still keep up the standards of service.

It was found in every-day practice that it took twenty minutes or so of juggling load and frequency, via long-distance telephone, to make the interconnection successfully. As the necessity for parallel operation grew, the present improvement was made. Two simple stations with synchronizing apparatus have been put out on the lines at the necessary interconnection points. Their arrangement is of the simplest possible character. Provision is made for interconnection of the apparatus and for cutting out a necessary section for repairs or inspection. For still further simplicity the synchroscopes used are of the electrostatic variety, which are found to operate admirably and give practically a considerable advantage in the absence of costly instrument transformers and their numerous accessories.

For this reason alone the installation of the electrostatic instrument saved more than \$500 in each of these synchronizing stations. As time goes on, the necessity for such stations is likely to increase. Larger and larger networks would be normally operated in parallel, as many of them are to-day. It may be necessary now and then, under these circumstances, to split off certain sections of the network while still keeping them in operation, for the sake of convenience in repairs or dealing with certain emergencies of load. It is then a great convenience to be able to synchronize and reunite these sections at any convenient point in the shortest time possible. Such special synchronizing stations, therefore, as those here described, under the control of the load dispatcher, may serve an exceedingly useful purpose, and the complete simplicity of the layout should encourage its more frequent use.

The Inductance of Long Reactance Coils

IN ELECTRICAL engineering one of the devices most frequently encountered is a coil of insulated wire. There are all kinds of coils. Their name is legion but they all have inductance. Their inductance is often a property of preponderating importance in the behavior and use of the coil. From the standpoint of inductance all coils may be divided into two classes, namely, those having magnetic cores and those having non-magnetic cores. The inductance of coils containing magnetic cores is so complicated, and depends on so many factors, that, in the discussion of their behavior, the conception of inductance is commonly relinquished. On the other hand, the inductance of coils with non-magnetic cores is a very valuable property, from the technical standpoint. It ordinarily remains nearly constant over a wide range of operating frequencies and current strengths.

For many purposes it is important to predetermine the inductance of a coil of given dimensions during the stage of its design and in advance of its construction. The conception of the inductance of an air-cored coil is easy. If we suppose that 10 amp. or 1 absampere of current flows steadily through the coil, we may imagine that all the magnetic flux lines or maxwells become visible to the eye and can be counted. Actually, of course, we can only visualize these flux lines in the mind's eye with the aid of pictures obtained from scattered iron filings. If now we count, in imagination, all the maxwells linking through each turn of the coil, the sum total of all these linkages for all the turns in succession will be the total inductance of the coil, expressed in abhenries.

The numerical realization of the inductances of such coils is, however, mathematically difficult, owing to the complexity in the distribution of the magnetic fluxes linked with them. Only in certain easy cases, such as closed circular solenoids or very long simple helices, is the formula a simple one. Various formulas have been published for different degrees of approximation, some simple and others more complex.

The article by H. B. Dwight this week on the subject is of considerable interest. He divides all non-magnetic cored reactance coils into long coils, short coils and flat coils. The "longs" have their lengths greater than their mean diameters. The "shorts" have their lengths less than their mean diameters but greater than their radial winding thicknesses. The "flats" have their lengths less than their radial winding thicknesses. This seems to be a useful basis for classification. The article supplies engineering formulas for the long coils only, it being the author's intention to discuss short coils later. The formulas are rather long, but they are definite and easily worked out, as is evidenced from the two problems which are cited in the text of the article by Mr. Dwight.

Incidentally it is noticeable that it is advantageous from an engineering standpoint to measure the dimensions of a coil in centimeters rather than in inches, and to express the inductance in abhenries rather than in henries, in order to obtain the simplest formulas. By this means, as the article indicates, certain constant perpetually appearing in the arithmetic can happily be eliminated.

Power at the Mine's Mouth

FOR a good many years past engineers with large vision of the future have dreamed and preached about the electrical transmission of power on a large scale from cheap coal burned at the very mine itself. But of it all little has come until very recent years, but to-day the projects for great networks fed from colossal generating stations and supplying the varied industries of a huge territory loom large on the horizon. They are beginning to come to realization, and it is a pleasure to give in our columns this week some further account of the first great system of the kind to undertake the fulfillment of its mission in the United States. The Windsor plant lies in the load center of the great manufacturing district concentrated in eastern Ohio, western Pennsylvania and the adjacent corner of West Virginia. From a physical standpoint the location is an exceptionally good one, too, inasmuch as an ample supply of good coal is available from a mine adjacent to the station. To-day it has a capacity of 60,000 kw. in two huge units, with four more to be added in the near future, two of them within the current year.

The boiler plant carries out the large proportions of the whole project, for there are but four boiler units for each turbo-generator, carrying 250 lb. pressure and furnished with superheat to 250 deg. Fahr. Each pair of turbines discharges into a single condenser pit, with the Ohio River for source of supply. Condensation involves some serious problems inasmuch as the river varies 50 ft. (15.2 m.) between high and low water. Each condenser pit is therefore carried down 74 ft. (22.5 m.) to take care of this extraordinary variation in level. Inasmuch as the boilers are also fitted with economizers, the auxiliaries are in the main motor-driven and are on a somewhat startling scale, requiring 600 hp. in motors for the two hydraulic air pumps and the two hot-well pumps in each condenser pit. The whole conception and execution of the project is on the basis of great output produced with the utmost economy, and it is estimated that from its situation at the mouth of the mine the plant even now releases to the railroads for other service about 4000 cars, thereby freeing locomotives, tracks and terminals. The significance of this feature, considering the dire lack of transportation facilities, is obvious. When the present plant is completed it will be one of the very largest central stations in the world, either steam or hydraulic, and cannot fail to

produce important industrial results in its territory.

It is interesting, too, inasmuch as it is owned in common by two companies, the Central Power Company and the West Penn Power Company. It is probably the first case of two independent companies thus operating a joint generating plant, and the idea of physical union has been carried even beyond this so as to include some of the transmission and distribution facilities. The two companies had each considered building a plant, but found that the joint enterprise would cost not much more than half the sum required for the two separately, owing in no small measure to the great cost of the condensing system. Working as a single station there is a better diversity factor and a higher load factor, to say nothing of elimination of no small number of lines for distribution. To conserve the interests of the two companies the perhaps unnecessary precaution was taken of building the plant on each side of a center line, so that its halves could be operated separately if at some future time it should seem desirable, and for simplicity the respective shares in the plant have been leased to an operating company which takes up the fixed charges and bills the component companies only their respective shares of the operating expense.

This has been determined in a rather ingenious way. Each item of the operating expense has been divided into a capacity charge and an output charge as fairly as has proved feasible. Then each company is charged on the basis of maximum demand and of annual consumption according to the weights given respectively to each of these factors. In this way each distributing company buys its power in bulk of the operating subsidiary on a fair division of costs. The arrangement is somewhat unusual but seems exceedingly practical. At all events, through this conjoint effort the beginnings have been made of bulk supply on a basis which brings at last a great possibility to realization. The experience of the last few years has very plainly shown that save under exceptional circumstances an economical steam plant can give hydroelectric stations a hard rub in the matter of cheap production of energy. Great sections of the country can be reached from commensurate hydraulic sources only by very long transmission lines, and if these are to be undertaken the ultimate ends of efficiency would be best served by turning the hydroelectric systems to the service of regions destitute of coal and permitting the latter to meet their own needs and reach out to adjacent territory as has been done in this admirable pioneer system.

WITH transportation facilities as congested as they are at present, the placing in operation of a bulk-supply generating station at the mouth of a coal mine is more than welcome, as it releases many coal cars, locomotives, tracks and terminals which would otherwise be required to serve a number of local generating stations. These advantages are particularly noticeable in the case of the Windsor (W. Va.) power plant, described in this issue, as it serves a great industrial district containing many coal mines, clay-products factories and steel mills which would have difficulty in operating isolated plants owing to the scarcity and poor quality of boiler-feed and condensing water available. The electrical features of this plant, including switching, trans-

The Coming Issues

forming and auxiliary drive arrangements, will be discussed in the next issue of the ELECTRICAL WORLD. Another feature of the Feb. 19 issue will be a particularly complete discussion of the fuel and maintenance savings possible from treating boiler-feed water. Results of numerous investigations are reported, relative advantages of different water-treating methods are outlined, and the amount which can be economically spent for treating apparatus will be calculated for a specific case. In addition to other articles which should be of interest to engineers with electric service companies, consulting firms, industrial plants, etc., there will be an article giving the results of an investigation to determine the effect of frequency and wave form on the performance of mercury-vapor rectifiers.

Bulk-Supply Generating Station at Mouth of Min

Features of the Windsor (W. Va.) Power Plant Now Being Operated Jointly by Two Companies—Arrangements Which Have Been Made for Dividing Operating Expense

WHEN considered in retrospect, the construction of the Windsor (W. Va.) plant of the American Gas & Electric Company and the West Penn Power Company will probably be looked upon as marking a new epoch in the central-station industry. Far-seeing engineers and central-station executives now view it as a pioneer station; they see it as one of an interconnected group of great plants strategically located to produce large quantities of energy so cheaply that it may be economically transmitted over wide areas to serve one of the greatest industrial districts in the world. It is true that plants have been built at coal mines before; but they have usually been handicapped by the quantity or quality of water available and have not been so convenient to large markets for energy. Before another year lapses the station will rank among the world's largest steam plants. It is the initial step toward carrying into actual practice in a broad way what has proved to be successful on a smaller scale in the Middle West with steam and in the Far West with hydroelectric power.

As a bulk-supply generating station the Windsor plant has an enviable location. Being on the Ohio River, it has an ample and dependable supply of water for condensing purposes. No other place between the Great Lakes and the Ohio River affords such a good and reliable supply. Plenty of good coal (13,500 B.t.u.) is available and easily securable, as a forty-five-year contract is signed with a coal mine adjacent to the station. Being situated at the mouth of the mine, the Windsor plant releases to the railroads of this country about 4000 cars,* the number that would be required were the energy developed by this plant produced locally. The plant operates at the high economy of 18,-

000 to 19,000 B.t.u. per kilowatt-hour, thereby saving about 3,500,000 tons of coal annually over that which would be required if the energy were produced in small local plants. This plant has the further advantage serving a territory in which the general run of boiler feed water gives enough trouble to isolated plants to make central-station service especially desirable to them.

From an electrical point of view the plant is also excellently situated. It lies in what is practically the center of the eastern Ohio, western Pennsylvania and Wheeling (W. Va.) industrial districts, being within 65 miles of some of the largest industrial centers in this country—Pittsburgh, Youngstown, Wheeling and Canton—with their coal mines, steel mills and clay products factories. In addition, the station is within one day's ride and two days' freight distance of 60 per cent of the population of the United States. Lying between the Eastern and Central time belts, the station benefits from the diversity in demand which comes from serving loads thrown on systems at different times because of the arbitrary shifting of clocks as the meridian is passed.

This station is particularly interesting because it represents the first case where two independent electric service companies have attempted to operate a generating plant jointly. This pooling of facilities has been extended beyond the generating station, however, to include some of the transmission and distribution facilities. The idea has frequently had its advocates, but until this instance no practical solutions have been found for handling the financial problems involved in making separation possible in case it is desirable to end joint ownership and operation.

Joint ownership was undertaken in this case because both the Central Power Company, a subsidiary of the American Gas & Electric Company, and the West Penn

*Based on number of cars in transit, loaded or returning, time required for loading and unloading, etc.

Power Company had separately considered building their own plants and found it would cost almost twice as much as for one jointly owned plant. This conclusion was reached because very expensive condensing water facilities are necessary owing to the large rise and fall (53 ft.) in the Ohio River. Furthermore, more reserve units and two operating forces would have been required if two independent plants had been built. As it is, a better diversity factor and hence a higher load factor are obtained. The same thing holds true with the distribution of energy. In some places the two companies have consumers in the same territories, which condition would have required duplication of lines if separate systems were employed.

To avoid the objections ordinarily raised to joint ownership the plant has been built on each side of a center line, so that at any time when the companies wish to operate they may take over separate and distinct plants. The financial problems have been simplified by the owners leasing their shares of the plant to an operating company, of which the Central Power Company and the West Penn Power Company each own 50 per cent of the stock at present. As the fixed charges are covered in this way, the operating company will bill the separate companies only for their respective shares of the operating expenses.

The prorating of the operating expenses has been simplified by dividing each item (Table I) into a capacity and an output charge, thereby compensating for the power factor and load factor. The ratio of the capacity charge to the output charge was arbitrarily chosen in each case, the proportion being obvious in most cases. For instance, supervision has to be provided regardless of whether the plant is operating or not, whereas the amount of fuel used is almost entirely dependent on output, a small percentage, of course, being required for banking. The capacity charge is based on the fifteen-minute integrated peak as actually measured.

From the analysis of each operating expense item it was found that a weight of 63 should be given to the maximum demand and 37 to the actual energy consumed. Thus if one company's maximum demand is

10,000 kw. and its annual consumption 25,000,000 kw.-hr., it will pay $(10,000 \div \text{plant capacity}) \times 0.63$ total operating expense and $(25,000,000 \div \text{total output}) \times 0.37$ total output expense. Similar arrangements are made for dividing transmission expenses where the lines are jointly used.

The ultimate rating of the station as it is now laid out will be 180,000 kw. in six units. Sixty thousand kilowatts of this rating is now provided in two ma-

FIG. 2—ROTATING SCREENS STRAIN THE CIRCULATING WATER

chines, and two additional units will be completed in 1918. The last two units will probably be installed shortly thereafter. For each turbine there are four boilers with 12,625 sq. ft. (136.0 sq. m.) of surface apiece. Each boiler is equipped with a separate economizer and induced-draft fan set over the boiler. Forced draft is also applied under the underfeed stokers. The boilers are arranged on both sides of a wide firing room. Along the center of this room is a large concrete coal pit into which fuel is delivered directly from the mine. From the pit coal is delivered to individual hoppers in front of each boiler.

In the turbine room the machines are set in a single line with their axes parallel to the firing aisle of the

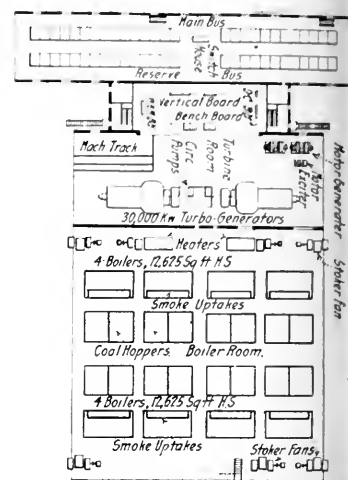

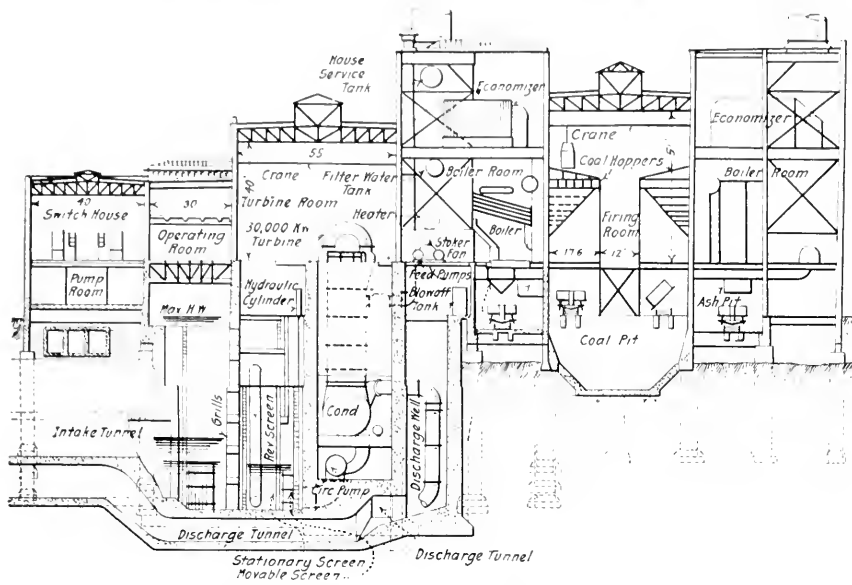

FIG. 1—ONE OF THE 30,000-KVA. TURBO-GENERATORS IN THE WINDSOR PLANT

boiler room. The steam ends of the turbo-generators installed are placed adjacent to each other and directly over a single condenser pit, an arrangement which will be carried out with each pair of units added. This scheme was employed to avoid the expense of two condenser pits, and to facilitate operation of the steam auxiliaries as well as the main units. The walls of the condenser pit serve as a foundation for the main turbines.

A very deep condenser pit was required—74 ft. (22.5 m.) below the main floor level—to permit placing

a 3-cu. yd. (2.29-cu. m.) grab bucket operated from an overhead crane. After being weighed it is dropped into the individual hoppers which serve each boiler. This indirect but effective method of handling coal inside the boiler room permits a rather large quantity of fuel to be carried inside the plant without great expense, since it was possible to construct the coal pit of concrete instead of steel. A large coal-storage yard will be provided near the plant in the future.

From the hopper the coal goes by gravity to West-inghouse underfeed stokers with fourteen retorts per boiler. A 100-hp. motor-driven forced-draft fan is provided for each boiler. Stokers of the underfeed

FIGS. 3 AND 4—CROSS-SECTION AND PLAN OF WINDSOR PLANT, SHOWING DEEP CONDENSER PIT, INSIDE COAL-STORAGE FACILITIES AND RELATIVE POSITIONS OF EQUIPMENT

the circulating pumps below the extreme low-water level of the Ohio River, and also to allow placing the condensers low enough for the cost of pumping circulating water to be a minimum at low river stages. The basement floor is just above high-water level and the main floor 18 ft. (5.4 m.) higher. The maximum variation in river level which has been recorded is 50 ft. (15.2 m.).

As this arrangement brings the basement floor 15 ft. (4.6 m.) above the ground outside the station, all tracks running into the station had to be laid on high trestles. While they were costly at the outset, space beneath them will be used for ash dumps for several years to come, thus providing a very economical means of disposing of ashes.

PROVISIONS FOR HANDLING COAL

The coal-handling facilities at the plant are unique in several respects. Coal is secured under a long-term contract from a mine owned by the Richland Coal Company, approximately 2000 ft. (609.6 m.) from the power house. It is hauled into the station in side-dump transfer cars on a standard-gage railroad track. All of this railroad equipment is owned by the central station. Standard-gage track is considered necessary, because in an emergency it will permit the shipment of fuel from other mines without inconvenience. At the plant the transfer cars are dumped into a concrete pit which measures approximately 35 ft. (10.7 m.) wide and runs the entire length of the station beneath the firing aisle in the boiler room. From this pit, which will hold more than 2500 tons (2267.9 t.) of coal, the fuel is lifted in

type were chosen for this service on account of the fact that they have proved efficient in burning West Virginia coal and have possibilities of high capacities.

The four boilers which serve each turbine are of the B. & W. cross-drum type. Each boiler has 12,625 sq. ft. (136 sq. m.) of heating surface and supplies steam at 250-lb (17.6 kg.) pressure and 250 deg. superheat. All settings are incased in steel to prevent air leakage. The four boilers which form a unit to serve each turbine are arranged in banks of two facing each other on opposite sides of the firing aisle. Each bank of boilers is connected to a manifold, which in turn is connected to the steam pipe running to the corresponding turbine. Leads from the separate boilers are cross-connected. The drums are placed 26.5 ft. (8.07 m.) above the firing aisle floor to provide an extra large furnace. Diamond soot blowers are installed on each unit.

As the gases leave the boiler they pass through economizers set directly over each boiler. The economizers, which are of the Sturtevant high-pressure type, are arranged in two divisions, eight tubes wide by thirty-six tubes long, giving 8625 sq. ft. (92.8 sq. m.) per economizer. This arrangement, the engineers believe, provides the maximum heat transfer. It also allows the space between the two sections to be utilized for a by-pass duct and permits a neat arrangement of the duct to the double-suction induced-draft fan. Moreover, this arrangement makes the economizer narrower and hence more accessible for repairs and cleaning. Dampers are provided in the uptake and are so arranged that in one position they close off the economizer and in the other they close the by-pass duct.

From each economizer the gases pass through a 60-in. fan to a smoke flue which connects three boilers to a 13-ft. by 146-ft. (3.9-m. by 44.5-m.) steel stack. Through the combined action of the induced and forced draft fans a practically balanced draft condition is

TABLE I—DIVISION OF OPERATING EXPENSES INTO CAPACITY CHARGE AND OUTPUT CHARGE

OPERATION	Capacity Charge, per Cent	Output Charge, per Cent

Total steam-power production: Labor, fuel supplies and repairs	37	63

maintained over the fire. The stoker blast equipment is designed to give a pressure equal to 6.5 in. (16.5 cm.) of water. Hand regulation is employed to give proper relation of fuel and air. The ash from the furnaces is dropped into pits, from which it can be dumped into the same transfer cars that are used for bringing coal to the plant.

As was already mentioned, the river fluctuates as much as 50 ft. between high and low water level; therefore it was necessary to set the condensers in a deep pit measuring 25 ft. 6 in. wide by 91 ft. long and 74 ft. deep (7.8 m. by 27.7 m. by 22.6 m.). The condensing

room between the machines has made it possible to handle the condensing machinery into and out of the pit with the 110-ton (99.8-t.) turbine-room crane.

Each condenser is set directly beneath the turbine which it serves and is connected to it by a pipe 13 ft. (3.96 m.) in diameter. An expansion joint with a new type of mercury seal is placed in the exhaust connection just above each condenser. The steel cross members which support the condensers are about 15 ft. (4 m.) above the floor of the condenser well, leaving space in the bottom of the pits for pumps. The vacuum pumps are of the Westinghouse Le Blanc type. On account of the fact that the condenser wells are deep and a large part of the auxiliary machinery is under the condensers electric push-button-operated elevators are employed between the turbine-room floor and the condenser pit for the convenience of the operator.

Water for the entire plant is taken from the Ohio River through a concrete tunnel to an intake crib, which stands beside the condenser well of units No. 1 and No. 2. In the crib the water passes successively through bar-iron grills, traveling screens and stationary

Boilers....Babcock & Wilcox cross-drum water-tube, four per turbine unit.	
Heating surface, each, sq. ft.....	12,625
Superheater surface, each, sq. ft.....	8,625
Heating surface, per kilowatt, sq. ft.....	1.65
Working pressure, lb. gage.....	250
Superheat, deg. Fahr.....	250
Stokers, Westinghouse underfeed, retorts per boiler.....	14
Boiler room coal-pit capacity, tons.....	2,500
Feed-water heater, rated capacity per square foot boiler heating surface, hp.....	0.37
Chimneys (steel unlined), height above boiler floor, ft.....	146
Chimneys, diameter, ft.....	13
UNIT TURBINE	
30,000 kw., three-phase, 60-cycle, r.p.m., General Electric Co. Weight per rated kilowatt capacity, lb.....	30.6
Condenser.....Westinghouse Electric & Manufacturing Co. Total tube surface per condenser, sq. ft.....	50,000
Tube area per kilowatt turbine capacity per square foot floor space, outside measurements, kw.....	140
Circulating pumps, centrifugal, motor-driven; capacity each, gal. per minute.....	50,000

*These data show what ratios, proportions, velocities, etc., have been used in the design of this station. The capacities are calculated from specification or guarantee figures. Unless otherwise specified, all ratios, both terms of which relate to boilers and kilowatt capacity, are based upon 30,000-kw. unit capacity.

screens to the rear chamber of the crib. The station arrangement permits the screens to be handled by the turbine-room crane, which is provided with a 15-ton (13.5-t.) auxiliary hoist. The traveling screens are arranged so that they can be raised or lowered as the river rises and falls.

From the screens the water is taken through cast-iron pipes to the circulating pumps, which are set directly under the condenser. Each pump discharges into the bottom of its respective condenser's water box. Similar arrangements will be provided for any other units added. An extra heavy sluiceway operated by a hydraulic cylinder is supplied to control flow of water to each circulating pump.

The discharge from each condenser comes out of the top and goes through a cast-iron pipe to the discharge well. It is returned to the river through a discharge tunnel which lies adjacent to the intake tunnel, but which is brought off at an angle so as to separate the discharge mouth from the intake.

Because the boilers are equipped with economizers and since the large units permit the production of energy at low cost, most of the auxiliaries are motor-

FIG. 5—TWO-SECTION ECONOMIZERS OVER BOILERS

equipment for two 30,000-kw. units is installed in this pit. Each condenser will contain 50,000 sq. ft. (5385 sq. m.) of cooling surface. Making the condenser pits large enough to contain two condensing equipments and providing an opening in the turbine

driven. In connection with each condensing equipment there are two hydraulic air pumps driven by 200-hp. motors and two hot-well pumps driven by 100-hp. motors. The hydraulic air pumps are set on a gallery adjacent to the condenser, making a very short suction connection. The hot-well pumps are installed on the floor of the condenser well under the condenser. All of the pumps which are operated in connection with each condensing equipment, including a 50,000-gal. (18,926.6-l.) circulating pump, are motor-driven.

The condensate is pumped through a primary heater in the upper part of the condenser and then up into a feed-water heater of the open type which is set on a platform immediately over the feed pumps. These pumps and one service pump are the only steam-driven auxiliaries in the plant.

Besides the auxiliaries which are attached to each separate unit there are one motor-driven and one steam-driven turbine service pump in the condenser well. These units are connected to a steel service tank under the boiler-room roof. This supplies all service and all make-up water, the latter being run through a settling tank and quartz filter before going to the feed-water heaters. No other water treating equipment is necessary. From the feed pump water is taken to the boilers through a double-feed system, the main feed being arranged to take water through the economizers and the auxiliary feed being arranged to deliver the water to the boilers direct. The water level is controlled by S. C. regulators.

The electrical features of the Windsor plant will be described in a future issue of the *ELECTRICAL WORLD*.

CONCRETE POLES CARRY 22,000-VOLT POWER LINE

Poles Cast Along the Lines—Cross-Arms Reinforced to Be Independent of Concrete—Erected with Derrick on Truck

In designing an electric pumping system for the 22,000-acre (8903-hectare) irrigation district at Brentwood, Cal., it was decided to take the current required at 22,000 volts. This made it necessary to distribute at this voltage by private line to the seven pumping plants located along a 6-mile (9.7-km.) length of the main canal and requiring in the aggregate approximately 2800 hp. The current was stepped down at each station to an operating voltage of 440.

Reinforced-concrete poles were selected for this transmission line because of their permanency, low maintenance cost and the greater security against line trouble which it was believed they would afford. The poles were designed in accordance with the specifications of the N. E. L. A. report of the committee on overhead-line construction, except that the allowance for ice load was omitted as unnecessary in the territory served.

The poles were considered as concrete beams reinforced symmetrically on four sides. To facilitate the computations and comparisons of costs and strengths for poles of various sizes, curves were drawn based on the A. S. C. E. reinforced-concrete beam formulas for beams reinforced symmetrically on two sides. As a result of the comparative studies it was decided to construct all poles of the same size, but to use two reinforcing systems so that there would be two grades

of poles, one light and one heavy. The poles were therefore made 16 in. (40.6 cm.) square at the ground when set 6 ft. (1.8 m.) deep, 41 ft. (12.5 m.) long and 8 in. (20.3 cm.) square at the top. The reinforcing in the heavy pole begins with twelve 1-in. (2.54-cm.) twisted steel bars at the base and in the light-weight pole with eight 1-in. (2.54-cm.) twisted steel bars. The

FIG. 1—MOLDING CONCRETE POLES ALONG RIGHT-OF-WAY

reinforcing decreases toward the top in both poles, but at least four bars extend to the top of the pole in both cases. The heavier pole is designed to withstand a 90 mile (144.8-km.) gale with the wires on one side broken. The lighter pole would probably not fail under these conditions, but would be subjected to much higher stresses.

When these poles were built the price of cement was \$2.23 per barrel and that of reinforcing bars 2.3 cents per pound (5.1 cents per kg.). At this rate there went into each pole \$7.23 worth of cement and \$21.30 worth of reinforcing bars. The total cost of labor, including casting, digging holes and erecting poles, amounted to \$30 per pole. The rate on common labor was \$2.50 an

FIG. 2—ERECTING CONCRETE POLES WITH SPECIAL DERRICK

for carpenters \$3.50 per nine-hour day. The average cost of the 109 poles erected in place was \$69.60 each exclusive of insulators, but inclusive of pine and telephone brackets, and with no allowance for salvage. The derrick built specially to erect the poles or on other tools used.

The average weight of 4 tons per pole made it i-

practicable to cast them in a yard and deliver the finished poles along the line, so the materials used in the concrete were delivered along the line and mixed by hand. Forms were laid on a platform consisting of two 4-in. by 10-in. (5.1-cm. by 25.4-cm.) planks. The vertical sides were held in place at the bottom by cleats and at the top by ties spanning the box. The reinforcement finished as a complete unit was suspended in these forms from the cross ties and the concrete shoveled in and carefully spaded. The cross-arms and buck-arms were molded integral with the pole.

DETAILS OF CONSTRUCTION AND ERECTION

In the cross-arms the reinforcing consists of 2-in. by 1/2-in. by 3/16-in. (5.1-cm. by 5.1-cm. by 0.5-cm.) steel angles bolted together at the ends and spread apart at the center so the reinforcing bars could be threaded through holes punched in the angles for that purpose. The insulator pins are carried directly by these angles, and thus the conductors are not in danger of falling in

FIG. 3—DETAILS OF CONCRETE POLES

use the concrete is broken from the cross-arms. The spans vary from 250 ft. to 390 ft. (76.2 m. to 118.9 m.). The heavier poles are used at each station and at every fifth pole between, also at road and line crossings where they are set in concrete.

The unusual weight of the concrete poles made it necessary to provide special means of erection. This was accomplished by mounting a double derrick on a dray, equipped with a six-part wire-rope tackle operated by a hand crab on the dray. A 10-in. by 10-in. (25.4-cm. by 25.4-cm.) timber was secured horizontally across the bed of the dray and extended 10 ft. (3.1 m.) beyond the front end of this timber a four-part manila rope tackle was run to the top of the derrick, thus affording leverage by which the outboard half could be lifted from the ground when it was desired to move the derrick.

After being put in position near one of the holes, two men guided the foot of the second leg as the four-part tackle was gradually eased up, thus locating the legs so that the derrick straddled the hole. A chain sling was

placed around the pole just above the center of gravity, the concrete being protected by wooden corner pads. The six-part wire-rope tackle was then hooked on and by means of the hand crab the pole was up-ended and dropped into the hole.

The poles were designed and built and the system was installed for the East Contra Costa Irrigation Company by Augustus Kempkey, consulting engineer, San Francisco, by whom the foregoing information was supplied. The contract for the construction was carried out by Balfour, Guthrie & Company.

WHITE WAY LIGHTING

BEGUN IN NEW ORLEANS

First Installment of 20 Miles of System Under Contract with New Orleans Railway & Light Company Is Started

The first installment of 20 miles (32.18 km.) of white way lighting provided for in the city contract signed recently with the New Orleans Railway & Light Company has been completed on Napoleon Avenue. It consists of ornamental metal standards mounting 200-cp. series tungsten lamps in round white globes, in double

NEW ORLEANS "WHITE WAY" LIGHTING IS BEGUN

rows spaced about six units to the block, providing very even distribution of light.

This system when completed will embrace all the principal streets of the city. In all 1500 single-light standards equipped with 200-cp. series incandescent lamps will be installed. At the same time the present arc lamps in other parts of the city, not to be equipped with the ornamental standards, will be replaced with high-power magnetite lamps which will practically treble the illumination afforded by the present system. The result will be a complete reorganization of the lighting of the entire city with a great improvement of the standard of brilliance and efficiency.

If Your Paper Is Late

If your copy of the ELECTRICAL WORLD is late in reaching you, please wait a day or so before writing us that it has been lost. Unparalleled congestion of the mails has caused delays in delivery of all mail matter.

Better Handling of Coal Problem Needed

Stimulus to Production and Methodical Co-ordination of Mining and Transportation Activities Are Essential to Meet the Enormous Fuel Requirements of the Present Year

IT IS characteristic of the energy and resourcefulness of the men controlling electric utilities that they are studying the subject of fuel supply and cost from every angle. They are going directly to the sources of supply, directly to the avenues of transportation. They are looking critically into methods of distribution, are analyzing details of cost.

Their investigation has been directed so carefully into every nook and corner of the coal situation that they may with modesty claim to be authorities equal to any other consumers, equal to many producers and carriers, equal even to the government officials who are now rigidly supervising fuel production, transportation and distribution. Although offering frequent suggestions, although participating actively in movements looking to the correction of past mistakes, they have very generally accepted and made the best of conditions imposed by the fact of war and strict governmental control.

CONSUMERS BECOME PRODUCERS ALSO

From the position of mere consumers of coal many of these properties have turned to be producers and, in part, the transportation or equipment agencies for their own supply. Collectively, therefore, the electrical industry represents every stage of the coal problem from unmined seams in the ground to grate.

It is from the background thus obtained that the industry, fighting to secure the adequate supply of fuel which alone will keep the steam stations in operation, fighting to secure it at a cost which can be met without financial disaster, presents its claims for better national (whether under government or private control) policies on the vital questions involved. These questions were not met and answered adequately in 1917, nor is the record of 1918 so far any more promising.

Such being the regrettable condition, the electrical industry believes that large statesmanship is necessary, that the co-operation of labor is required, that better co-ordination of production, transportation and distribution facilities is a vital essential in the tremendous-scale improvement which alone will assure adequate supply at fair cost. In the opinion of the industry, a reconsideration of these elements is all that will give comfortable conditions throughout 1918 and in the already dreaded winter of 1918-19.

Reconsideration of the methods adopted in handling these different elements will give an opportunity for new decisions. New decisions can be made in the light of the mistakes in the old decisions, with a longer

outlook into the future than it is felt controlled the policies of last year. Admitting frankly that mistakes have been made, there is still room to build new policies for the future and to eliminate the errors of the past. To admit that no mistakes have been made would subject the nation to the risk of the same policies which tangoed it carelessly along in 1917 to the almost fatal consequences of the last few weeks.
